The following is a summary of the comments we received regarding our exclusion proposal.

Comment: Many commenters supported our proposal to provide an exclusion for the e-Prescribing measure to those MIPS eligible clinicians who write less than 100 permissible prescriptions during the performance period, and many commenters requested additional exclusions. Commenters disagreed with the removal of exclusions for other objectives, such as the transitions of care measure under the Health Information Exchange objective that existed under the EHR Incentive Programs. Many suggested continuing all EHR Incentive Programs Modified Stage 2 and Stage 3 exclusions under MIPS. Others suggested that exclusions be added to the Health Information Exchange measure under 2014 Edition CEHRT and the MIPS Clinical Information Reconciliation measure. Some suggested an exclusion for the Health Information Exchange Objective be added if a MIPS eligible clinician has fewer than 100 external referrals. Commenters also requested exclusions for clinicians who do not refer patients and those with insufficient broadband availability. Commenters recommended low-volume exclusions for various measures including e-Prescribing, Provide Patient Access, and the measures under the Coordination of Care Through Patient Engagement, and Health Information Exchange objectives. Commenters also urged the addition of an exclusion for MIPS eligible clinicians practicing in multiple locations because they may encounter specific hardships due to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

CEHRT availability. Some requested that any meaningful use exclusions for Public Health and Clinical Data Registry Reporting remain in effect for those using the 2014 CEHRT. Some requested an exclusion should exist for the Syndromic Surveillance Reporting measure for those physicians who do not directly or rarely diagnose or treat conditions related to syndromic surveillance. Another commenter requested that we maintain the meaningful use Stage 3 exclusion for the Patient-Specific Education and that MIPS eligible clinicians with no office visits during the performance period be permitted to report a "null value" and achieve full base and performance score credit.

Response: We note that we are finalizing fewer required measures for the base score of the advancing care information performance category than we had proposed. As there are now fewer required measures, we do not believe that it is necessary to create additional exclusions for measures which are now optional for reporting. In addition, as we have moved the Immunization Registry Reporting measure from "required" in the base score to "not required" in the base score, we are not finalizing our proposal to provide an exclusion for those MIPS eligible clinicians who do not administer immunizations during the performance period. The exclusion is no longer necessary because MIPS eligible clinicians now have the option of whether or not to report on Immunization Registry Reporting to receive credit for this measure under the performance score of the advancing care information performance category.

Comment: A few commenters supported the elimination of exclusions and noted that the elimination of thresholds enable MIPS eligible clinicians to focus more on quality patient care and less on meeting thresholds.

Response: We appreciate the support of these commenters and agree that the fewer required measures and elimination of thresholds have enabled the removal of many of the exclusions that existed under the EHR Incentive Programs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

After consideration of the comments, we are finalizing our exclusion policy as proposed with the following modification. We are not finalizing the exclusions for the Immunization Registry Reporting measure under the Public Health and Clinical Data Registry Reporting objective for those MIPS eligible clinicians who do not administer immunizations as part of their practice.

#### (8) Additional Considerations

##### (a) Reweighting of the Advancing Care Information Performance Category for MIPS Eligible Clinicians without Sufficient Measures Applicable and Available

As discussed in the proposed rule, section 101(b)(1)(A) of the MACRA amended section 1848(a)(7)(A) of the Act to sunset the meaningful use payment adjustment at the end of CY 2018. Section 1848(a)(7) of the Act includes certain statutory exceptions to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. Specifically, section 1848(a)(7)(D) of the Act exempts hospital-based EPs from the application of the payment adjustment under section 1848(a)(7)(A) of the Act. In addition, section 1848(a)(7)(B) of the Act provides that the Secretary may exempt an EP who is not a meaningful EHR user for the EHR reporting period for the year from the application of the payment adjustment under section 1848(a)(7)(A) of the Act if the Secretary determines that compliance with the requirements for being a meaningful EHR user would result in a significant hardship, such as in the case of an EP who practices in a rural area without sufficient internet access. The MACRA did not maintain these statutory exceptions for the advancing care information performance category of the MIPS. Thus, the exceptions under sections 1848(a)(7)(B) and (D) of the Act are limited to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act and do not apply in the context of the MIPS.

Section 1848(q)(5)(F) of the Act provides, if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician, the Secretary shall

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assign different scoring weights (including a weight of zero) for each performance category based on the extent to which the category is applicable to each type of MIPS eligible clinician, and for each measure and activity specified for each such category based on the extent to which the measure or activity is applicable and available to the type of MIPS eligible clinician.

We believe that under our proposals for the advancing care information performance category of the MIPS, there may not be sufficient measures that are applicable and available to certain types of MIPS eligible clinicians as outlined in the proposed rule, some of whom may have qualified for a statutory exception to the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. For the reasons stated in the proposed rule, we proposed to assign a weight of zero to the advancing care information performance category for purposes of calculating a MIPS final score for these MIPS eligible clinicians. We refer readers to section II.E.6. of the proposed rule for more information regarding how the quality, cost and improvement activities performance categories would be reweighted.

(i) Hospital-Based MIPS Eligible Clinicians

Section 1848(a)(7)(D) of the Act exempts hospital-based EPs from the application of the meaningful use payment adjustment under section 1848(a)(7)(A) of the Act. We defined a hospital-based EP for the EHR Incentive Program under §495.4 as an EP who furnishes 90 percent or more of his or her covered professional services in sites of service identified by the codes used in the HIPAA standard transaction as an inpatient hospital or emergency room setting in the year preceding the payment year, or in the case of a payment adjustment year, in either of the 2 years before the year preceding such payment adjustment year. Under this definition, EPs that have 90 percent or more of payments for covered professional services associated with claims with Place of Service Codes 21 (inpatient hospital) or 23 (emergency department) are considered hospital-based (75 FR 44442).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We believe there may not be sufficient measures applicable and available to hospital-based MIPS eligible clinicians under our proposals for the advancing care information performance category of MIPS.

Hospital-based MIPS eligible clinicians may not have control over the decisions that the hospital makes regarding the use of health IT and CEHRT. These MIPS eligible clinicians therefore may have no control over the type of CEHRT available, the way that the technology is implemented and used, or whether the hospital continually invests in the technology to ensure it is compliant with ONC certification criteria. In addition, some of the specific advancing care information performance category measures, such as the Provide Patient Access measure under the Patient Electronic Access objective requires that patients have access to view, download and transmit their health information from the EHR which is made available by the health care clinician, in this case the hospital. Thus the measure is more attributable and applicable to the hospital and not to the MIPS eligible clinician, as the hospital controls the availability of the EHR technology. Further, the requirement under the Protect Patient Health Information objective to conduct a security risk analysis, would rely on the actions of the hospital, rather than the actions of the MIPS eligible clinician, as the hospital controls the access and availability and secure implementation of the EHR technology. In this case, the measure is again more attributable and applicable to the hospital than to the MIPS eligible clinician. Further, certain specialists (such as pathologists, radiologists and anesthesiologists) who often practice in a hospital setting and may be hospital-based MIPS eligible clinicians often lack face-to-face interaction with patients, and thus, may not have sufficient measures applicable and available to them under our proposals. For example, hospital-based MIPS eligible clinicians who lack face-to-face patient interaction may not have patients for which they could transfer or create an electronic summary of care record.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

In addition, we noted that eligible hospitals and CAHs are subject to meaningful use requirements under sections 1886(b)(3)(B) and (n) and 1814(l) of the Act, respectively, which were not affected by the enactment of the MACRA. Eligible hospitals and CAHs are required to report on objectives and measures of meaningful use under the EHR Incentive Program, as outlined in the 2015 EHR Incentive Programs final rule. We noted the objectives and measures of the EHR Incentive Programs for eligible hospitals and CAHs are specific to these facilities, and are more applicable and better represent the EHR technology available in these settings.

For these reasons, we proposed to rely on section 1848(q)(5)(F) of the Act to assign a weight of zero to the advancing care information performance category for hospital-based MIPS eligible clinicians. We proposed to define a “hospital-based MIPS eligible clinician” at §414.1305 as a MIPS eligible clinician who furnishes 90 percent or more of his or her covered professional services in sites of service identified by the codes used in the HIPAA standard transaction as an inpatient hospital or emergency room setting in the year preceding the performance period, otherwise stated as the year 3 years preceding the MIPS payment year. For example, under this proposal, hospital-based determinations would be made for the 2019 MIPS payment year based on covered professional services furnished in 2016. We also proposed, consistent with the EHR Incentive Program, that we would determine which MIPS eligible clinicians qualify as “hospital-based” for a MIPS payment year. We invited comments on these proposals.

In addition, we sought comment on how the advancing care information performance category could be applied to hospital-based MIPS eligible clinicians in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

We also sought comment on whether the previously established 90 percent threshold of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

payments for covered professional services associated with claims with Place of Service (POS) Codes 21 (inpatient hospital) or 23 (emergency department) is appropriate, or whether we should consider lowering this threshold to account for hospital-based MIPS eligible clinicians who bill more than 10 percent of claims with a POS other than 21 or 23. Although we proposed a threshold of 90 percent, we are considering whether a lower threshold would be more appropriate for hospital-based MIPS eligible clinicians. In particular, we are interested in what factors should be applied to determine the threshold for hospital-based MIPS eligible clinicians. We will continue to evaluate the data to determine whether there are certain thresholds which naturally define a hospital-based MIPS eligible clinician.

The following is a summary of the comments we received regarding our proposal for defining hospital-based MIPS eligible clinicians.

Comment: Many commenters supported our proposed definition of a hospital-based MIPS eligible clinician as those who furnish 90 percent or more of his or her covered professional services in either Place of Service 21 or 23. Many also supported the proposal to assign a weight of zero to the advancing care information performance category for hospital-based MIPS eligible clinicians, citing that health IT decisions for these MIPS eligible clinicians are often made at the hospital level and are out of their control.

Response: We thank commenters for their support of our proposal. For the reasons stated in the proposed rule, and based on the measures we are finalizing in this final rule with comment period, we agree that there may not be sufficient measures applicable and available to hospital-based MIPS eligible clinicians to report for the advancing care information performance category.

Comment: A few commenters disagreed with our proposal and provided alternate hospital-based thresholds. They recommended that the threshold be lowered to a majority (or

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

more than 50 percent). Several commenters recommended a 75 percent threshold, while another suggested reducing the threshold to 60 percent. One commenter recommended that CMS adopt a flexible approach that accommodates eligible clinicians who work in multiple settings.

Response: Although commenters suggested alternate thresholds, they did not provide specific rationale to support the lowered thresholds or the factors that should be applied to determine the threshold for hospital-based MIPS eligible clinicians. With commenter feedback in mind, we have reevaluated the data and found that historical claims data support a lower threshold as suggested in these comments. With consideration of the comments and data we have reviewed, we are reducing the percentage of covered professional services furnished in certain sites of service to determine hospital-based MIPS eligible clinicians from 90 percent to 75 percent. The data analyzed supports the comments we received while still allowing MIPS eligible clinicians with 25 percent or more of their services in a settings outside of inpatient hospital, on-campus outpatient hospital (as referenced below) or emergency room settings to participate and earn points in the advancing care information performance category.

Comment: Many commenters proposed that CMS broaden the definition of “hospital-based clinician” to include those MIPS eligible clinicians who are employed by a hospital, but still bill outpatient services, as those MIPS eligible clinicians will not have input into the selection of the EHR, pointing out that facility-based clinicians in both inpatient and outpatient settings experience the similar difficulties in meeting the proposed objectives and measures in the advancing care information performance category. Another commenter believed that CMS should include other clinician settings, such as ambulatory surgery centers, with hospital inpatient and ED settings as clinicians in other settings may also lack control over EHR technology. Another urged CMS to revise the criteria to include care provided in hospital outpatient departments and ASCs, excluding evaluation and management services. One

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenter supported our proposal for hospital-based MIPS eligible clinicians and recommended that CMS also include POS 22 (on-campus outpatient hospital) because many hospitalists provide care in both the inpatient setting, as well as on-campus outpatient hospital departments. Another commenter suggested that the definition of hospital-based MIPS eligible clinicians include observation services.

Response: We agree with commenters that there are MIPS eligible clinicians who bill using place of service codes other than POS 21 and POS 23 but who predominantly furnish covered professional services in a hospital setting and have no control over EHR technology. We believe these clinicians should be considered hospital-based for purposes of MIPS, and therefore, we are expanding our hospital-based definition to include POS 22, on-campus outpatient hospital.

Comment: One commenter recommended using the newly-introduced Medicare specialty billing code for hospitalists in the definition of “hospital-based.”

Response: The official use of the Medicare specialty billing code for hospitals does not begin until after the start of the MIPS program, and therefore we have no historical data to support its inclusion in the definition of hospital-based at this time. We will consider this recommendation for future rulemaking.

Comment: One commenter recommended that CMS describe this group of MIPS eligible clinicians as facility-based rather than hospital-based.

Response: We appreciate the comment although we continue to believe that hospital-based is the more appropriate term. We believe facility-based is too broad a term and could be misleading.

Comment: A commenter requested that CMS be transparent about the time period used for determining whether an MIPS eligible clinician is hospital-based.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We proposed to use data from the year preceding the performance period, otherwise stated as the year that is 3 years preceding the MIPS payment year. We are adopting a modified final policy and will instead use claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period. For example, for the 2017 performance period (2019 MIPS payment year) we will use the data available at the end of October 2016 for Medicare claims with dates of service between September 1, 2015, through August 31, 2016, to determine whether a MIPS eligible clinician is considered hospital-based by our definition. In the event that it is not operationally feasible to use claims from this exact time period, we will use a 12-month period as close as practicable to September 1 of the calendar year 2 years preceding the performance period and August 31 of the calendar year preceding the performance period. We have adopted this change in policy in an effort to provide transparency to MIPS eligible clinicians; this change in timeline will allow us to notify MIPS eligible clinicians of their hospital-based status prior to the start of the performance period. By adopting this policy and notifying MIPS eligible clinicians of their hospital-based determination prior to the performance period, we enable MIPS eligible clinicians to better plan and prepare for reporting.

Comment: One commenter noted that specialists who meet the criteria for being considered a hospital-based MIPS eligible clinician may still have access and the ability to effectively use CEHRT, and may sufficiently meet the requirements of the advancing care information performance category, while those MIPS eligible clinicians who do not meet the hospital-based criteria as proposed would not be able to meet those requirements. The commenter suggested taking this into consideration and proposed allowing some MIPS eligible clinicians who are not hospital-based, but who still face the same hardships, to reweight and redistribute their advancing care information performance category score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We realize that some MIPS eligible clinicians face similar challenges around the inability to control their access to CEHRT even if they are not determined to be hospital-based. We refer readers to section II.E.5.g.(8)(a)(ii) of this final rule with comment period for further discussion of reweighting applications for those MIPS eligible clinicians who face a significant hardship.

Comment: Commenters recommended offering MIPS eligible clinicians or groups the option to petition for a change in their hospital-based status when there is a change in their organizational affiliation.

Response: We agree that circumstances change from year to year and MIPS eligible clinicians' hospital-based determination should be reevaluated for each MIPS payment year. We note that we are finalizing a policy to determine hospital-based status for each MIPS payment year by looking at a MIPS eligible clinician's covered professional services based on claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period. We appreciate the suggestion that MIPS eligible clinicians should have the ability to petition their hospital-based status. However, we believe this annual reevaluation in combination with our policy that hospital-based MIPS eligible clinicians may choose to report to the advancing care information performance category should they determine that there are applicable and available measures for them to submit allow sufficient flexibility for hospital-based MIPS eligible clinicians without the need to petition their hospital-based status.

After consideration of the public comments and the data we have available, we are finalizing our proposal for MIPS under §414.1305 with the following modifications. Under the MIPS, a hospital-based MIPS eligible clinicians is defined as a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

identified by the Place of Service (POS) codes used in the HIPAA standard transaction as an inpatient hospital (POS 21), on campus outpatient hospital (POS 22), or emergency room (POS 23) setting, based on claims for a period prior to the performance period as specified by CMS.

We intend to use claims with dates of service between September 1 of the calendar year 2 years preceding the performance period through August 31 of the calendar year preceding the performance period, but in the event it is not operationally feasible to use claims from this time period, we will use a 12-month period as close as practicable to this time period.

We note that this expanded definition of hospital-based MIPS eligible clinician will include a greater number of MIPS eligible clinicians than the previously proposed definition. We have expanded this definition because we believe it better represents hospital-based eligible clinicians and acknowledges the challenges they face with regard to EHR reporting as stated above. For the reasons stated in the proposed rule, our assumption remains that MIPS eligible clinicians who are determined hospital-based do not have sufficient advancing care information measures applicable to them, and thus we will reweight the advancing care information performance category to zero percent of the MIPS final score for the MIPS payment year in accordance with section 1848(q)(5)(F) of the Act. If a MIPS eligible clinician disagrees with our assumption and believes there are sufficient advancing care information measures applicable to them, they have the option to report the advancing care information measures for the performance period for the MIPS payment year for which they are determined hospital-based. However, if a MIPS eligible clinician who is determined hospital-based chooses to report on the advancing care information measures, they will be scored on the advancing care information performance category like all other MIPS eligible clinicians, and the performance category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of their advancing care information performance category score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(ii) MIPS Eligible Clinicians Facing a Significant Hardship

Section 1848(a)(7)(B) of the Act provides that the Secretary may exempt an EP who is not a meaningful EHR user for the EHR reporting period for the year from the application of the payment adjustment under section 1848(a)(7)(A) of the Act if the Secretary determines that compliance with the requirements for being a meaningful EHR user would result in a significant hardship. In the Stage 2 final rule (77 FR 54097-54100), we defined certain categories of significant hardships that may prevent an EP from meeting the requirements of being a meaningful EHR user. These categories include:

- Insufficient Internet Connectivity (as specified in 42 CFR 495.102 (d)(4)(i)).
- Extreme and Uncontrollable Circumstances (as specified in 42 CFR 495.102 (d)(4)(iii)).
- Lack of Control over the Availability of CEHRT (as specified in 42 CFR 495.102 (d)(4)(iv)(A)).
- Lack of Face-to-Face Patient Interaction (as specified in 42 CFR 495.102 (d)(4)(iv)(B)).

We believe that under our proposals for the advancing care information performance category, there may not be sufficient measures applicable and available to MIPS eligible clinicians within the categories above. For these MIPS eligible clinicians, we proposed to rely on section 1848(q)(5)(F) of the Act to re-weight the advancing care information performance category to zero.

Sufficient internet access is fundamental to many of the measures proposed for the advancing care information performance category. For example, the e-Prescribing measure requires sufficient access to the Internet to transmit prescriptions electronically, and the Secure Messaging measure requires sufficient Internet access to receive and respond to patient

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

messages. These measures may not be applicable to MIPS eligible clinicians who practice in areas with insufficient internet access. We proposed to require MIPS eligible clinicians to demonstrate insufficient internet access through an application process in order to be considered for a reweighting of the advancing care information performance category. The application would have to demonstrate that the MIPS eligible clinicians lacked sufficient internet access, during the performance period, and that there were insurmountable barriers to obtaining such infrastructure, such as a high cost of extending the internet infrastructure to their facility.

Extreme and uncontrollable circumstances, such as a natural disaster in which an EHR or practice building are destroyed, can happen at any time and are outside a MIPS eligible clinician's control. If a MIPS eligible clinician's CEHRT is unavailable as a result of such circumstances, the measures specified for the advancing care information performance category may not be available for the MIPS eligible clinician to report. We proposed that these MIPS eligible clinicians submit an application to include the circumstances by which the EHR technology was unavailable, and for what period of time it was unavailable, to be considered for reweighting of their advancing care information performance category.

In the Stage 2 final rule (77 FR 54100) we discussed EPs who practice at multiple locations, and may not have the ability to impact their practices' health IT decisions. We noted the case of surgeons using ambulatory surgery centers or a physician treating patients in a nursing home who does not have any other vested interest in the facility, and may have no influence or control over the health IT decisions of that facility. If MIPS eligible clinicians lack control over the CEHRT in their practice locations, then the measures specified for the advancing care information performance category may not be available to them for reporting. To be considered for a reweighting of the advancing care information performance category, we proposed that these MIPS eligible clinicians would need to submit an application demonstrating

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that a majority (50 percent or more) of their outpatient encounters occur in locations where they have no control over the health IT decisions of the facility, and request their advancing care information performance category score be reweighted to zero. We noted that in such cases, the MIPS eligible clinician must have no control over the availability of CEHRT. Control does not imply final decision-making authority. For example, we would generally view MIPS eligible clinicians practicing in a large, group as having control over the availability of CEHRT, because they can influence the group's purchase of CEHRT, they may reassign their claims to the group, they may have a partnership/ownership stake in the group, or any payment adjustment would affect the group's earnings and the entire impact of the adjustment would not be borne by the individual MIPS eligible clinician. These MIPS eligible clinicians can influence the availability of CEHRT and the group's earnings are directly affected by the payment adjustment. Thus, such MIPS eligible clinicians would not, as a general rule, be viewed as lacking control over the availability of CEHRT and would not be eligible for their advancing care information performance category to be reweighted based on their membership in a group practice that has not adopted CEHRT.

In the Stage 2 final rule (77 FR 54099), we noted the challenges faced by EPs who lack face-to-face interaction with patients (EPs that are non-patient facing), or lack the need to provide follow-up care with patients. Many of the measures proposed under the advancing care information performance category require face-to-face interaction with patients, including all eight of the measures that make up the three performance score objectives (Patient Electronic Access, Coordination of Care Through Patient Engagement and Health Information Exchange). Because these proposed measures rely so heavily on face-to-face patient interactions, we do not believe there would be sufficient measures applicable to non-patient facing MIPS eligible clinicians under the advancing care information performance category. We proposed to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

automatically reweight the advancing care information performance category to zero for a MIPS eligible clinician who is classified as a non-patient facing MIPS eligible clinician (based on the number of patient-facing encounters billed during a performance period) without requiring an application to be submitted by the MIPS eligible clinician. We refer readers to section II.E.1.b. of the proposed rule for further discussion of non-patient facing MIPS eligible clinicians. We also sought comment on how the advancing care information performance category could be applied to non-patient facing MIPS eligible clinicians in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

We proposed that all applications for reweighting the advancing care information performance category be submitted by the MIPS eligible clinician or designated group representative in the form and manner specified by CMS. We proposed that all applications may be submitted on a rolling basis, but must be received by us no later than the close of the submission period for the relevant performance period, or a later date specified by us. For example, for the 2017 performance period, applications must be submitted no later than March 31, 2018 (or later date as specified by us) to be considered for reweighting the advancing care information performance category for the 2019 MIPS payment year. An application would need to be submitted annually to be considered for reweighting each year.

The following is a summary of comments received.

Comment: Most commenters supported the inclusion of something similar to a hardship exception under the EHR Incentive Program for the advancing care information performance category and the reweighting of the advancing care information score to zero. Other commenters expressed appreciation that CMS has moved away from the 5 year limitation to hardship exceptions.

Response: We appreciate the support of our proposal, and note that we did not propose

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

exceptions from reporting on the advancing care information performance category or from application of the MIPS payment adjustment factor based on hardship. Rather, we are recognizing that there may not be sufficient measures applicable and available under the advancing care information performance category to MIPS eligible clinicians who lack sufficient internet connectivity, face extreme and uncontrollable circumstances, lack control over the availability of CEHRT, or do not have face-to-face interactions with patients. For those MIPS eligible clinicians, we proposed to reweight the advancing care information performance category to zero percent in the MIPS final score.

Comment: We received many comments suggesting various additions to our proposal. One commenter suggested hardship exceptions under the advancing care information performance category for both 2017 and 2018 for practices that are experiencing transitional, infrastructural changes. One commenter suggested expanding the exceptions for unforeseen circumstances to a minimum of 5 years. Another requested that one of the hardship categories for the 2017 performance period include the lateness of the publication of the final rule with comment period, which will create a short timeline for adjustment to new requirements. A commenter strongly recommended that hospitalist be added to the list because they do the majority of their work in a hospital.

Response: We note that, in some cases, transitional infrastructure changes might be considered under the extreme and uncontrollable circumstances category, depending upon the particular circumstances of the clinician practice. We believe that it is necessary for MIPS eligible clinicians to submit an application to reweight their advancing care information performance category score to zero for each applicable year. We do not believe it is appropriate to automatically reweight to zero the advancing care information performance category score for a span of multiple years as circumstances change year to year. We believe that our policy to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

allow a minimum of 90-days data for the transition year of MIPS helps to address any issues related to the timing of the release of this final rule with comment period. We refer readers to section II.E.4. of this final rule with comment period for further discussion of the MIPS performance period. Finally we note that hospital medicine is not a clinician specialty that is identified through the Medicare enrollment process. Those MIPS eligible clinicians that are considered hospital-based by our definition would have their advancing care information performance category weighted at zero percent of the MIPS final score as was previously discussed in this final rule with comment period.

Comment: Many commenters suggested additional categories related to CEHRT. One commenter asked CMS to create hardship exceptions to ensure that clinicians are not unfairly punished for the failures of their CEHRT, citing concerns of past failures with technologies in meeting standards imposed by CMS and ONC. Yet another commenter recommended that we consider expanding the criteria for 2017 and 2018 to include specific clinician types that can prove that they would incur major administrative and financial burdens by adopting EHR technology for the first and second performance period. Another commenter suggested that exceptions be developed to avoid negative payment adjustments in 2019 for EHR migration difficulties. Other commenters suggested exception for switching CEHRT and providing hardships when CEHRT is decertified.

Response: We appreciate this input and understand that there may be many issues related to CEHRT that may result in a MIPS eligible clinician being unable to report on measures under the advancing care information performance category due to circumstances outside of their control. As we do not want to limit potential unforeseen circumstances we will consider issues with vendors and CEHRT under the “extreme and uncontrollable circumstances” category, but we note that not all issues may qualify as extreme and outside of control of the clinician.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter supported continued hardship exceptions for clinicians who practice in settings such as skilled nursing facilities where they do not have control over availability of CEHRT, however they also believe this proposal does not go far enough. The commenter explained that without a hardship exception granted, these facilities will be encouraged to limit the number of patients seen by their clinicians so that they can avoid being eligible to participate in MIPS, which would adversely affect the access to care provided to this vulnerable population. They requested that skilled nursing facility visits (POS 31) and nursing facility visits (POS 32) (CPT codes 99304-99318) simply be exempt from meaningful use, and by extension the advancing care information performance category.

Response: While we acknowledge this issue, we believe that it is adequately addressed by the “lack of control over CEHRT” category and does not warrant the exemption of certain evaluation and management codes. As we have noted previously, this final rule with comment period only addresses policies related to MIPS eligible clinicians and not Medicaid EPs, eligible hospitals or CAHs under the Medicare and Medicaid EHR Incentive Programs.

Comment: Other commenters believed that CMS should continue a hardship exception for medical centers because the medical centers will have to monitor more programs requiring some but less of the same data. The commenters stated that the processes are confusing and time-consuming.

Response: We currently do not allow a hardship exception specific to medical centers under the EHR Incentive Program. Medical centers are not subject to the application of the MIPS payment adjustment factors and are not addressed in this rulemaking.

Comment: A few commenters requested that, as was included in the Medicare and Medicaid EHR Incentive Programs, an automatic hardship exception be granted to the following PECOS specialties: diagnostic radiology (30), nuclear medicine (36), interventional radiology

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(94), anesthesiology (05) and pathology (22).

Response: We disagree that we should reweight to zero the advancing care information performance category score based on specialty code, and note that our proposal and final policy for reweighting the advancing care information performance category is based on the number of patient-facing encounters billed during a performance period, not based on specialty type. In the EHR Incentive Programs, we offered an exception to the Medicare payment adjustments to certain specialties as designated in PECOS because we recognized that EPs within the specialties that lack face-to-face interactions and lack follow up with patients with sufficient frequency (77 FR 54099-54100). Under the MIPS, we proposed to automatically reweight the advancing care information performance category to zero for any hospital-based MIPS eligible clinicians and/or non-patient facing MIPS eligible clinicians who may not have sufficient measures applicable and available to them. Some of the MIPS eligible clinicians in specialties referenced by the commenter may have sufficient patient encounters to report the measures under the advancing care information performance category, and thus, the advancing care information performance category measures would be applicable to these MIPS eligible clinicians.

Comment: A commenter suggested that CMS publish an explanation of what constitutes “limited” internet access and list limited access areas per the Federal Communications Commission (FCC).

Response: We have stated that MIPS eligible clinicians located in an area without sufficient Internet access to comply with objectives requiring Internet connectivity, and faced insurmountable barriers to obtaining such Internet connectivity could be apply for significant hardship. The FCC’s National Broadband Map allows MIPS eligible clinicians to search, analyze, and map broadband availability in their area: <http://www.broadbandmap.gov/>.

Comment: One commenter recommended a new option to allow applications to reweight

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

advancing care information performance category to zero for MIPS eligible clinicians who did not previously intend to participate in meaningful use in CY 2017, and instead planned to obtain a significant hardship to avoid the Electronic Health Record Incentive Program 2019 payment adjustment.

Response: We note that under section 101(b)(1) of the MACRA, the payment adjustments under the Medicare EHR incentive program will end after the 2018 payment adjustment year, which is based on the EHR reporting period in 2016. Therefore, MIPS eligible clinicians are not required to participate in the Medicare EHR incentive programs in the 2017 EHR reporting period to avoid a 2019 payment adjustment. MIPS eligible clinicians may qualify for reweighting of their advancing care information performance category score if they meet the criteria outlined in our policy for reweighting under MIPS.

Comment: A commenter recommended that CMS explicitly clarify that the "lack of influence over the availability of CEHRT" option for reweighting advancing care information performance category to zero is not limited to multi-location/practice MIPS eligible clinicians.

Response: The "lack of control over the availability of CEHRT" is not limited to MIPS eligible clinicians who practice at multiple locations, instead, it is available to any MIPS eligible clinicians who may not have the ability to impact their practices' health IT decisions. We noted that in such cases, the MIPS eligible clinician must have no control over the availability of CEHRT. We further specified that a majority (50 percent or more) of their outpatient encounters must occur in locations where they have no control over the health IT decisions of the facility. Control does not imply final decision-making authority as demonstrated in the example given in our proposal.

Comment: A commenter recommended granting MIPS eligible clinicians that are eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for Social Security benefits a hardship exception because of the considerable expenditures of both human and financial capital that would require several years to see a return on investment.

Response: While we understand this suggestion, we do not believe that it is appropriate to reweight this category solely on the basis of a MIPS eligible clinicians' age or Social Security status. We have analyzed EHR Incentive Program data, as well as provider feedback, and believe that while other factors such as the lack of access to CEHRT or unforeseen environmental circumstances may constitute a significant hardship, the age of an MIPS eligible clinician alone or the preference to not obtain CEHRT does not.

Comment: Commenters requested that application for reweighting not be burdensome for MIPS eligible clinicians to submit. One commenter requested that CMS clarify whether MIPS eligible clinicians will need to submit an annual application to be excluded from the advancing care information performance category or if this will occur automatically and the commenter preferred the latter.

Response: We noted that CMS would specify the form and manner that reweighting applications are submitted outside the rulemaking process. Additional information on the submission process will be available after the rule is published. We do note that if an application is required, it must be submitted annually.

Comment: Some commenters stated that MIPS eligible clinicians, who did not qualify for meaningful use, will need more time to familiarize themselves with EHR and could receive a low MIPS final score and negative payment adjustment due to lack of CEHRT. They believed that these MIPS eligible clinicians most likely serve high-disparity populations and that the most vulnerable patient populations could be negatively impacted.

Response: We acknowledge that under MIPS more clinicians will be subject to the requirements of EHR reporting than were previously eligible under the EHR Incentive Program

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

and may not have advancing care information measures that are applicable or available for them to submit. For this reason, we have proposed to reweight the advancing care information performance category to zero for hospital-based MIPS eligible clinicians, NPs, PAs, CRNAs and CNSs. We have also allowed for MIPS eligible clinicians to apply for a reweighting of their advancing care information performance category score should the MIPS eligible clinician not have measures that are applicable or available to them for various reasons as discussed in section II.E.5.g. of this final rule with comment period. We do not agree that MIPS eligible clinicians who were not eligible for the EHR Incentive Programs are concentrated in high disparity populations, nor do we believe that serving such a population would limit a MIPS eligible clinician's ability to report on the advancing care information objectives and measures.

After consideration the comments, we are finalizing our policy to re-weight the advancing care information performance category to zero percent of the MIPS final score for MIPS eligible clinicians facing a significant hardships as proposed. For the reasons discussed in the proposed rule, we continue to assume that these clinicians may not have sufficient measures applicable and available to them for the advancing care information performance category. Should a MIPS eligible clinician apply for their advancing care information performance category to be reweighted under this policy but subsequently determine that their situation has changed such that they believe there are sufficient measures applicable and available to them for the advancing care information performance category, they may report on the measures. If they choose to report, they will be scored on the advancing care information performance category like any other MIPS eligible clinician, and the category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of the MIPS eligible clinician's advancing care information performance category score.

(iii) Nurse Practitioners, Physician Assistants, Clinical Nurse Specialists, and Certified

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

## Registered Nurse Anesthetists

The definition of a MIPS eligible clinician under section 1848(q)(1)(C) of the Act includes certain non-physician practitioners, including Nurse Practitioners (NPs), Physicians Assistants (PAs), Certified Registered Nurse Anesthetists (CRNAs) and Clinical Nurse Specialists (CNSs). CRNAs and CNSs are not eligible for the incentive payments under Medicare or Medicaid for the adoption and meaningful use of CEHRT (sections 1848(o) and 1903(t) of the Act, respectively) or subject to the meaningful use payment adjustment under Medicare (section 1848(a)(7)(A) of the Act), and thus, they may have little to no experience with the adoption or use of CEHRT. Similarly, NPs and PAs may also lack experience with the adoption or use of CEHRT, as they are not subject to the payment adjustment under section 1848(a)(7)(A) of the Act. We further noted that only 19,281 NPs and only 1,379 PAs have attested to the Medicaid EHR Incentive Program. Nurse practitioners are eligible for the Medicaid incentive payments under section 1903(t) of the Act, as are PAs practicing in a FQHC or a RHC that is led by a PA, if they meet patient volume requirements and other eligibility criteria.

Because many of these non-physician clinicians are not eligible to participate in the Medicare and/or Medicaid EHR Incentive Program, we have little evidence as to whether there are sufficient measures applicable and available to these types of MIPS eligible clinicians under our proposals for the advancing care information performance category. The low numbers of NPs and PAs who have attested for the Medicaid incentive payments may indicate that EHR Incentive Program measures required to earn the incentive are not applicable or available, and thus, would not be applicable or available under the advancing care information performance category. For these reasons, we proposed to rely on section 1848(q)(5)(F) of the Act to assign a weight of zero to the advancing care information performance category if there are not sufficient

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures applicable and available to NPs, PAs, CRNAs, and CNSs. We would assign a weight of zero only in the event that an NP, PA, CRNA, or CNS does not submit any data for any of the measures specified for the advancing care information performance category. We encourage all NPs, PAs, CRNAs, and CNSs to report on these measures to the extent they are applicable and available, however, we understand that some NPs, PAs, CRNAs, and CNSs may choose to accept a weight of zero for this performance category if they are unable to fully report the advancing care information measures. We believe this approach is appropriate for the first MIPS performance period based on the payment consequences associated with reporting, the fact that many of these types of MIPS eligible clinicians may lack experience with EHR use, and our current uncertainty as to whether we have proposed sufficient measures that are applicable and available to these types of MIPS eligible clinicians. We noted that we would use the first MIPS performance period to further evaluate the participation of these MIPS eligible clinicians in the advancing care information performance category and would consider for subsequent years whether the measures specified for this category are applicable and available to these MIPS eligible clinicians.

We invited comments on our proposal. We additionally sought comment on how the advancing care information performance category could be applied to NPs, PAs, CRNAs, and CNSs in future years of MIPS, and the types of measures that would be applicable and available to these types of MIPS eligible clinicians.

The following is a summary of the comments we received regarding our proposal.

Comment: Commenters generally supported our proposal to reweight the advancing care information performance category for those MIPS eligible clinicians without sufficient measures. Most commenters supported CMS' proposal that submission under the advancing care information performance category for NPs, PAs, CNSs, and CRNAs, would be optional in 2017

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

given these non-physicians' lack of past participation in meaningful use.

Response: We appreciate commenters for their support of this proposal and we agree for the reasons stated in the proposed rule that it is appropriate to assign a weight of zero only if the aforementioned practitioners do not submit data for any of the advancing care information performance category measures.

Comment: One commenter urged CMS to revise the proposed rule so that NPs and advanced practice nurses (APNs) can obtain EHR Incentive Program incentives.

Response: This final rule with comment period implements the MIPS as authorized under section 1848(q) of the Act. Eligibility for incentive payments under the EHR Incentive Program is determined under a separate section of the statute. Any change to the eligibility or extension of incentive payments under the EHR Incentive Program would require a change to the law and is not in the scope of this final rule with comment period.

Comment: One commenter requested CMS make advancing care information performance category participation optional for clinicians who primarily provide services in post-acute care settings, which have not been part of the EHR Incentive Program in the past. Several commenters supported excluding clinicians not eligible to participate in the Medicare/Medicaid EHR Incentive Programs.

Response: While we understand the concerns of the commenters, we disagree with their suggestions. Section 1848(q)(1)(C)(i) of the Act defines a MIPS eligible clinician to include specific types of clinicians and provides discretion to include other types of clinicians in later years. In the future, we expect additional clinician types will be added to the definition of MIPS eligible clinician.

Comment: A commenter noted that by allowing additional non-physician practitioners (NPs, PAs, and in the future, dietitians, etc.) to be eligible to participate in the advancing care

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

information performance category, the number of eligible clinicians under MIPS will greatly increase from the number of eligible clinicians in the EHR Incentive Program. The increased number of eligible clinicians will cause an unnecessary burden for organizational support staff to track and report their data. Commenters recommend advancing care information performance category data reporting be rolled up to the clinicians that they bill under so that clinician reporting includes data representing their MIPS eligible clinicians.

Response: As we noted above, the definition of MIPS eligible clinician is broader than the definition of an EP in the EHR Incentive Program, and we intend to add additional clinician types to the definition of MIPS eligible clinician in future years. Under this program, we have added a group reporting option in which MIPS eligible clinicians who have reassigned their billing rights to a TIN may report at the group or TIN level instead of the individual level. We believe this addresses the administrative concerns raised by this comment and allows MIPS eligible clinicians to aggregate their data for reporting, therefore reducing reporting burden.

After consideration of the comments, we are finalizing our NPs, PAs, CRNAs, and CNSs policy as proposed. These MIPS eligible clinicians may choose to submit advancing care information measures should they determine that these measures are applicable and available to them; however, we note that if they choose to report, they will be scored on the advancing care information performance category like all other MIPS eligible clinicians and the performance category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act regardless of their advancing care information performance category score.

(iv) Medicaid

In the 2015 EHR Incentive Programs final rule we adopted an alternate method for demonstrating meaningful use for certain Medicaid EPs that would be available beginning in 2016, for EPs attesting for an EHR reporting period in 2015 (80 FR 62900). Certain Medicaid

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

EPs who previously received an incentive payment under the Medicaid EHR Incentive Program, but failed to meet the eligibility requirements for the program in subsequent years, are permitted to attest using the CMS Registration and Attestation system for the purpose of avoiding the Medicare payment adjustment (80 FR 62900). However, as discussed in the proposed rule, section 101(b)(1)(A) of the MACRA amended section 1848(a)(7)(A) of the Act to sunset the meaningful use payment adjustment for Medicare EHR Incentive Program EPs at the end of CY 2018. This means that after the CY 2018 payment adjustment year, there will no longer be a separate Medicare EHR Incentive Program for EPs, and therefore Medicaid EPs who may have used this alternate method for demonstrating meaningful use cannot potentially be subject to a payment adjustment under the Medicare EHR Incentive Program at that time. Accordingly, there will no longer be a need for this alternate method of demonstrating meaningful use after the CY 2018 payment adjustment year.

Similarly, beginning in 2014, states were required to collect, upload and submit attestation data for Medicaid EPs for the purposes of demonstrating meaningful use to avoid the Medicare payment adjustment (80 FR 62915). This form of reporting will also no longer need to continue with the sunset of the meaningful use payment adjustment for Medicare EHR Incentive Program EPs at the end of CY 2018. Accordingly, we proposed to amend the reporting requirement described at 42 CFR 495.316(g) by adding an ending date such that after the CY 2018 payment adjustment year states would no longer be required to report on meaningful EHR users.

We noted that the Medicaid EHR Incentive Program for EPs was not impacted by the MACRA and the requirement under section 1848(q) of the Act to establish the MIPS program. We did not propose any changes to the objectives and measures previously established in rulemaking for the Medicaid EHR Incentive Program, and thus, EPs participating in that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

program must continue to report on the objectives and measures under the guidelines and regulations of that program.

Accordingly, reporting on the measures specified for the advancing care information performance category under MIPS cannot be used as a demonstration of meaningful use for the Medicaid EHR Incentive Programs. Similarly, a demonstration of meaningful use in the Medicaid EHR Incentive Programs cannot be used for purposes of reporting under MIPS.

Therefore, MIPS eligible clinicians who are also participating in the Medicaid EHR Incentive Programs must report their data for the advancing care information performance category through the submission methods established for MIPS in order to earn a score for the advancing care information performance category under MIPS and must separately demonstrate meaningful use in their state's Medicaid EHR Incentive Program in order to earn a Medicaid incentive payment. The Medicaid EHR Incentive Program continues through payment year 2021, with 2016 being the final year an EP can begin receiving incentive payments (§495.310(a)(1)(iii)). We solicited comments on alternative reporting or proxies for EPs who provide services to both Medicaid and Medicare patients and are eligible for both MIPS and the Medicaid EHR Incentive Payment.

The following is a summary of the comments we received regarding our proposal to separate the reporting requirements of MIPS and the Medicaid EHR Incentive Programs:

Comment: Many commenters stated the reporting burden imposed on MIPS eligible clinicians who also participate in the Medicaid EHR Incentive Programs, would have to report separately to achieve points in the advancing care information performance category, and to receive an incentive payment in the Medicaid EHR Incentive Programs. Some commenters urged CMS to align reporting requirements and submission methods across both programs to eliminate duplication in reporting effort. Some commenters requested that CMS eliminate the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

need to report duplicative quality measures by modifying its proposal to require that if quality is reported in a manner acceptable under MIPS or an APM, then it would not need to be reported under the Medicaid EHR Incentive Program. Other commenters expressed concern that varying reporting requirements for MIPS eligible clinicians, for hospitals and Medicaid EPs who participate in the EHR Incentive Programs will bring hardship to clinician staff, as well as EHR vendors.

Response: We understand that reporting burden is a concern to MIPS eligible clinicians and CMS remains committed to exploring opportunities for alignment when possible. However, MIPS and the Medicare and Medicaid EHR Incentive Program are two separate programs with distinct requirements. The reporting requirements and scoring methods of the Medicaid EHR Incentive Program and those finalized for the advancing care information performance category in the MIPS program differ significantly. For example, in the Medicaid EHR Incentive Programs, EPs must report on all objectives and meet measure thresholds finalized in the 2015 EHR Incentive Programs final rule. In the advancing care information performance category, MIPS eligible clinicians must report on objectives and measures, but are not required to meet measure thresholds to be considered a meaningful EHR user.

We remind commenters that while MIPS eligible clinicians would be required to meet the requirements of the advancing care information performance category to earn points toward their MIPS final score, there is no longer a requirement that EPs demonstrate meaningful use under the Medicaid EHR incentive program as a way to avoid the Medicare EHR payment adjustments. However, MIPS eligible clinicians who meet the Medicaid EHR Incentive Program eligibility requirements are encouraged to additionally participate in the Medicaid EHR Incentive Program to be eligible for Medicaid incentive payments through program year 2021.

Comment: A few commenters proposed that MIPS eligible clinicians who are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participating in the Medicaid EHR Incentive Program be exempted from reporting to MIPS until after the completion of their final EHR performance period. Others proposed allowing clinicians to choose either to report in the Medicaid EHR Incentive Program or the advancing care information performance category of MIPS. One commenter suggested awarding MIPS eligible clinicians 30 points toward the advancing care information performance category score if they successfully attest to meaningful use in the Medicaid EHR Incentive Program.

Response: As previously mentioned, objective and measure requirements of the Medicaid EHR Incentive Program and those finalized for the advancing care information performance category in the MIPS program vary too greatly to enable one to serve as proxy for another.

We are finalizing our Medicaid policy as proposed.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

#### h. APM Scoring Standard for MIPS Eligible Clinicians Participating in MIPS APMs

Under section 1848(q)(1)(C)(ii) of the Act, as added by section 101(c)(1) of MACRA and as discussed in section II.F.5. of this final rule with comment period, Qualifying APM Participants (QPs) are not MIPS eligible clinicians and are thus excluded from MIPS payment adjustments. Partial Qualifying APM Participants (Partial QPs) are also not MIPS eligible clinicians unless they opt to report and be scored under MIPS. All other eligible clinicians participating in APMs who are MIPS eligible clinicians are subject to MIPS requirements, including reporting requirements and payment adjustments. However, most current APMs already assess their participants on cost and quality of care and require engagement in certain care improvement activities.

We proposed at §414.1370 to establish a scoring standard for MIPS eligible clinicians participating in certain types of APMs (“APM scoring standard”) to reduce participant reporting burden by eliminating the need for such APM eligible clinicians to submit data for both MIPS and their respective APMs. In accordance with section 1848(q)(1)(D)(i) of the Act, we proposed to assess the performance of a group of MIPS eligible clinicians in an APM Entity that participates in certain types of APMs based on their collective performance as an APM Entity group, as defined at §414.1305.

In addition to reducing reporting burden, we sought to ensure that eligible clinicians in APM Entity groups are not assessed in multiple ways on the same performance activities. For instance, performance on the generally applicable cost measures under MIPS could contribute to upward or downward adjustments to payments under MIPS in a way that is not aligned with the strategy in an ACO initiative for reducing total Medicare costs for a specified population of beneficiaries attributed through the unique ACO initiative’s attribution methodology. Depending on the terms of the particular APM, we believe similar misalignments could be common between

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the MIPS quality and cost performance categories and the evaluation of quality and cost in APMs. We believe requiring eligible clinicians in APM Entity groups to submit data, be scored on measures, and be subject to payment adjustments that are not aligned between MIPS and an APM could potentially undermine the validity of testing or performance evaluation under the APM. We also believe imposition of these requirements would result in reporting activity that provides little or no added value to the assessment of eligible clinicians, and could confuse eligible clinicians as to which CMS incentives should take priority over others in designing and implementing care activities.

We proposed to apply the APM scoring standard to MIPS eligible clinicians in APM Entity groups participating in certain APMs (“MIPS APMs”) that meet the criteria listed below (and would be identified as “MIPS APMs” on the CMS Website). In the proposed rule, we defined the proposed criteria for MIPS APMs, the MIPS performance period for APM Entity groups, the proposed MIPS scoring methodology for APM Entity groups, and other information related to the APM scoring standard (81 FR 28234-28247).

(1) Criteria for MIPS APMs

We proposed at §414.1370 to specify that the APM scoring standard under MIPS would only be applicable to eligible clinicians participating in MIPS APMs, which we proposed to define as APMs (as defined in section II.F.4. of the proposed rule) that meet the following criteria: (1) APM Entities participate in the APM under an agreement with CMS; (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a Participation List; and (3) the APM bases payment incentives on performance (either at the APM Entity or eligible clinician level) on cost/utilization and quality measures. We understood that under some APMs the APM Entity may enter into agreements with clinicians or entities that have supporting or ancillary roles to the APM Entity’s performance under the APM, but are not participating under

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the APM Entity and therefore are not on a Participation List. We proposed not to consider eligible clinicians under such arrangements to be participants for purposes of the APM Entity group to which the APM scoring standard would apply. We also proposed that the APM scoring standard would not apply for certain APMs in which the APM Entities participate under statute or our regulations rather than under an agreement with us. We solicited comments on how the APM scoring standard should apply to those APMs as well.

The criteria for the identification of MIPS APMs are independent of the criteria for Advanced APM determinations discussed in section II.F.4. of this final rule with comment period, so a MIPS APM may or may not also be an Advanced APM. As such, it would be possible that an APM meets all three proposed criteria to be a MIPS APM, but does not meet the Advanced APM criteria described in section II.F.4. of this final rule with comment period. Conversely, it would be possible that an Advanced APM does not meet the criteria listed above because it does not include MIPS eligible clinicians as participants.

The APM scoring standard would not apply to MIPS eligible clinicians involved in APMs that include only facilities as participants. APMs that do not base payment on cost/utilization and quality measures also would not meet the proposed criteria for the APM scoring standard. Instead, MIPS eligible clinicians participating in these APMs would need to meet the generally applicable MIPS data submission requirements for the MIPS performance period, and their performance would be assessed using the generally applicable MIPS standards, either as individual eligible clinicians or as a group under MIPS.

As we explained in the proposed rule, we believe the proposed APM scoring standard would help alleviate certain duplicative, unnecessary, or competing data submission requirements for MIPS eligible clinicians participating in MIPS APMs. However, we were interested in public comments on alternative methods that could reduce MIPS data submission

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

requirements to enable MIPS eligible clinicians participating in Advanced APMs to maximize their focus on the care delivery redesign necessary to succeed within the Advanced APM while maintaining the statutory framework that excludes only certain eligible clinicians from MIPS and reducing reporting burden on Advanced APM participants.

We proposed that the APM scoring standard would not apply to MIPS eligible clinicians participating in APMs that are not MIPS APMs. Rather, such MIPS eligible clinicians would submit data to MIPS and have their performance assessed either as an individual MIPS eligible clinician or group as described in section II.E.2 of this final rule with comment period. Some APMs may involve certain types of MIPS eligible clinicians that are affiliated with an APM Entity but not included in the APM Entity group because they are not participants of the APM Entity. We proposed that even if the APM meets the criteria to be a MIPS APM, MIPS eligible clinicians who are not included in the MIPS APM Participation List would not be considered part of the participating APM Entity group for purposes of the APM scoring standard. For instance, MIPS eligible clinicians in the Next Generation ACO Model might be involved in the APM through a business arrangement with the APM Entity as “preferred providers” but are not directly tied to beneficiary attribution or quality measurement under the APM.

The following is a summary of the comments we received regarding our proposals for the criteria for an APM to be a MIPS APM, and for the APM scoring standard to apply only to MIPS eligible clinicians who are included in the APM Entity group on a MIPS APM Participation List.

Comment: A commenter sought clarity on the term “MIPS APM”.

Response: The term “MIPS APM” is used to describe an APM that meets the three criteria for purposes of the APM scoring standard: (1) APM Entities participate in the APM under an agreement with CMS; (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a Participation List; and (3) the APM bases payment incentives on

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance (either at the APM Entity or eligible clinician level) on cost/utilization and quality measures. Individuals and groups that do not participate in MIPS APMs will be scored under the generally applicable MIPS scoring standards. We note that the APM scoring standard has no bearing on the QP determination for eligible clinicians in Advanced APMs.

Comment: Some commenters stated that the definition of MIPS APMs is too limiting and prevents eligible clinicians in APMs that are not considered MIPS APMs from reporting as APM Entities. Other commenters indicated that basing payment on quality measures should not be a MIPS APM criterion.

Response: We continue to believe the criteria we proposed for a MIPS APM will appropriately identify APMs in which the eligible clinicians would be subject to potentially duplicative and conflicting incentives and reporting requirements if they were required to report and be scored under the generally applicable MIPS standard. The eligible clinicians in a MIPS APM that is not also an Advanced APM are considered MIPS eligible clinicians and are subject to MIPS reporting requirements and payment adjustments (unless they are otherwise excluded). The eligible clinicians in a MIPS APM that is an Advanced APM are also considered MIPS eligible clinicians unless they meet the threshold to be a QP for a year. In any MIPS APM, whether or not it is also an Advanced APM, eligible clinicians may already be required to report on the quality, cost and other measures on which their performance is assessed as part of their participation in the APM, leading to potentially duplicative or conflicting reporting under MIPS. Additionally, eligible clinicians in these MIPS APMs already have payment incentives tied to performance on quality and cost/utilization measures, creating the potential for conflicting assessments based on the same or similar data. Although other APMs may have similar reporting requirements to the MIPS APMs such that there is some level of duplicative reporting, unless an APM includes performance metrics tied to payment incentives in the APM, we do not believe

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

there is the same potential for duplication and conflict. We continue to believe that eligible clinicians in APMs that meet all three of the criteria to be MIPS APMs would face a substantial level of duplication and/or conflict between reporting and assessment under the APM and the generally applicable MIPS standard. In addition, the participants in other APMs may not be subject to MIPS at all because the participants are not MIPS eligible clinicians. To the extent that eligible clinicians do participate in APMs that are not MIPS APMs, we believe they would often be in a position to consider group reporting options under MIPS.

Comment: A few commenters suggested CMS simplify MIPS reporting and scoring by requiring no additional reporting requirements for any MIPS eligible clinicians in MIPS APMs to receive a MIPS final score. One commenter stated the APM Scoring Standard does not go far enough to reduce reporting burden because APM participants will still be required to report improvement activities and advancing care information.

Response: We believe the proposed policy included meaningful reductions in reporting burden for MIPS APM participants. The additional policies we are finalizing in this rule (such as assigning a MIPS APM improvement activities score) will reduce this burden further. However, we do not believe it would be feasible to fully eliminate reporting requirements for MIPS APM participants while adhering to the core goals and structure of MIPS.

Comment: A few commenters stated it is untenable to require physician groups to simultaneously pursue quality metrics, reduce costs, and build the infrastructure required to participate in APMs and MIPS. A few commenters indicated that the APM scoring standard may undermine the intent of the statute to have eligible clinicians join APMs by not providing sufficient reductions in burden under MIPS. Another commenter recommended that the third MIPS APM criterion be changed to “the APM bases payment incentives on performance on cost/utilization and/or quality measures” instead of requiring that the APM base payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

incentives on both cost/utilization and quality measures. Several commenters recommended that CMS make QP determinations early enough so that eligible clinicians participating in Advanced APMs would know in advance of the MIPS submission period whether they are QPs for the year and, as such would not have to report to MIPS at all. One commenter did not support implementation of the APM scoring standard because the commenter stated that the proposal was confusing and may incentivize physicians to remain in the FFS program rather than progress towards APMs.

Response: We recognize that MIPS APM participants are diligently working to provide high quality, cost-effective care to their patients. We also recognize the burden of reporting to more than one CMS program. We proposed to adopt the APM scoring standard with the intent of reducing the reporting burden for eligible clinicians and alleviating duplicative and/or conflicting payment methodologies that could potentially distract eligible clinicians from the goals and objectives they agreed to as an APM participant, or provide incentives that conflict with those under the APM. We also acknowledge that some stakeholders may find the APM scoring standard requirements confusing, and we will continue to consider ways to further simplify the APM scoring standard in future rulemaking. We believe much of this confusion will be resolved through continued discussions with all of our stakeholders, participants, and patients, through CMS's planned technical assistance and education and outreach activities for the Quality Payment Program, and through experience with this new program in the first performance year. We also note that the finalized QP Performance Period, described in section II.F.5. of this final rule with comment period, modifies the proposed QP determination timeframe so that eligible clinicians who are QPs for a year will not need to report MIPS data. However, an eligible clinician that is in an Advanced APM but does not meet the QP threshold will still be subject to MIPS. Furthermore, eligible clinicians who are participants in a MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM that is not an Advanced APM cannot be QPs and thus will be subject to MIPS under the APM scoring standard.

Comment: A commenter recommended that CMS not reward low-value care. The commenter indicated that by reducing the cost performance category to zero and reducing the weight for the quality performance category to zero for MIPS APMs other than the Shared Savings Program and Next Generation ACO Model, CMS may allow such MIPS APMs to perform poorly on measures of efficiency and quality at the expense of other clinicians who are truly delivering high-value care. The commenter suggested that CMS either measure all MIPS eligible clinicians in the same way, or allow MIPS APM participants to elect a neutral score for the quality and cost MIPS performance categories.

Response: We do not believe the APM scoring standard rewards low-value care, but rather that it provides MIPS eligible clinicians in MIPS APMs a way to meet the requirements of the MIPS while focusing on the goals of the APM to improve quality and lower the cost of care. The terms and conditions of MIPS APMs themselves hold participants accountable for the cost and quality of care. In accordance with the statute, only Partial QPs have the option whether to report and be subject to a MIPS payment adjustment for a year, as described in section II.F.5. of this final rule with comment period. All MIPS eligible clinicians, including those subject to the APM scoring standard, will continue to receive final scores and MIPS payment adjustments.

Comment: A commenter indicated the creation of the APM scoring standard provides a large advantage to MIPS APM participants, disadvantaging other MIPS eligible clinicians.

Response: We acknowledge that eligible clinicians in MIPS APMs may achieve high scores in some MIPS performance categories. In some categories such as improvement activities, the statute encourages and credits participation in an APM. In others, MIPS eligible clinicians may perform well because of the requirements they meet by virtue of participating in MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APMs. However, we believe all MIPS eligible clinicians have the opportunity to score highly, and as such we do not believe the APM scoring standard will necessarily disadvantage other MIPS eligible clinicians. We believe MIPS eligible clinicians under the APM scoring standard have the potential to receive high MIPS payment adjustments because they successfully perform the requisite activities, not simply because they participate in an APM.

Comment: One commenter recommended CMS ensure that the APM scoring standard actually reduces administrative burden in order to allow MIPS APM participants to focus on APM efforts.

Response: We believe this final rule with comment period addresses many of the concerns expressed by commenters about the MIPS reporting burden for MIPS APM participants and we will continue to work to identify ways to ensure APMs and their participants can focus their efforts to achieve the care transformation goals of the APM.

Comment: Several commenters expressed support for the APM scoring standard as proposed and applauded CMS for its efforts to reduce reporting burden and allow MIPS APM participants to focus on the aims of those APMs without misaligning incentives or having redundant or conflicting requirements across programs. One commenter stated they supported the proposed APM scoring standard, but thought CMS should offer sufficient education and outreach to clinicians so they understand it, as it adds complexity to the program. Two commenters requested that CMS develop a flexible scoring methodology for MIPS APMs that would recognize the significant investments to transform healthcare made by APM participants. One commenter requested that the APM scoring standard incorporate all MIPS eligible clinicians in large multispecialty groups that may have some but not all MIPS eligible clinicians participating in MIPS APMs. Another commenter recommended that the APM scoring standard be retained in the future, allowing APM decisions to be made with clarity, while another

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenter supported the APM scoring standard generally but thought it should be optional.

Response: We appreciate the general support for the proposed APM scoring standard.

We will continue to consider future refinements to the APM scoring standard to ensure we are supporting eligible clinicians in their efforts to transform health care and participate in new payment and care delivery models. Although we understand that some organizations may have some members of their practices in APMs and others not in APMs, we do not believe that the APM scoring standards should apply more broadly than the identified group of actual participants in MIPS APMs, that is, the eligible clinicians included on an APM Entity's Participation List.

Comment: A few commenters disagreed with our statements in the proposed rule suggesting that APMs focused on hospitals do not have any MIPS eligible clinicians as participants, stating that surgeons will be involved in hip and knee replacements under CJR and CJR quality performance measures should count for them for purposes of MIPS. Another commenter stated that the MIPS APM criteria should be broader to include the BPCI Initiative, CJR, and other episode payment models. A few commenters stated that such APMs have been successful at reducing costs and improving quality and that not including them as MIPS APMs discourages clinicians from participation. A few commenters suggested that CMS should amend facility-based APMs to require Participation Lists. One commenter suggested that the APM scoring standard requirement that a MIPS APM must require APM Entities to include at least one eligible clinician on a Participation List should be delayed until more MIPS APMs are available. A few commenters suggested the criteria for a MIPS APM be expanded to include other APMs such as those APMs that have an agreement with another payer outside the Medicare program or those that have a CMS agreement to participate in an APM through another entity such as a convener. One commenter expressed concern that by not including all APMs as

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS APMs some APM participants will be forced to report twice on quality.

Response: An APM that is hospital-based may be a MIPS APM if it meets all of the MIPS APM criteria, including the criterion that the APM must require APM Entities to include at least one MIPS eligible clinician on a Participation List. If this criterion is not met, the APM is not a MIPS APM and the APM scoring standard does not apply.

Particularly relevant to facility- or hospital-based APMs (because some do not require APM Entities to maintain Participation Lists), any MIPS eligible clinicians that do not qualify as QPs or Partial QPs, and are not included on a Participation List of an APM Entity that participates in the MIPS APM, would report to MIPS and be scored according to the generally applicable MIPS requirements for an individual or group. The APM scoring standard is intended to ensure that the MIPS eligible clinicians that are directly and collectively accountable for beneficiary attribution and quality and cost/utilization performance under the MIPS APM are able to focus their efforts on the care transformation objectives of the APM rather than on potentially duplicative reporting of measures. We note that the MIPS eligible clinicians that are subject to the APM scoring standard are not necessarily the same as the eligible clinicians who could become QPs via participation in Advanced APMs, as described in section II.F.5. of this final rule with comment period. For instance, in certain circumstances, Affiliated Practitioners could become QPs, but because the Advanced APM does not base payment incentives for these eligible clinicians (either at the APM Entity or the eligible clinician level) on their performance on cost/utilization and quality measures we do not consider the APM requirements to be sufficiently related to MIPS reporting requirements such that the APM scoring standard should be applied. In other words, the QP determination for the APM incentive and the MIPS performance categories measure different aspects of performance that align differently with the roles of affiliated practitioners. The QP determination depends on the level of payments or

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

patients furnished services through an Advanced APM. In contrast, MIPS payment adjustments depend on an assessment of performance on cost and quality in four categories. Whereas affiliated practitioners may furnish services through an Advanced APM, contributing to collective achievement under the APM, the QP threshold, in and of itself, does not assess or directly incentivize their performance based on cost and quality. Therefore, we do not believe there is the same potential for overlapping requirements under MIPS and APMs for such MIPS eligible clinicians. Under certain Advanced APMs such as CJR, Affiliated Practitioners may be the primary eligible clinicians receiving payment through the Advanced APM, but cost and quality measurement and reporting under the Advanced APM are the responsibility of participating hospitals rather than eligible clinicians. As such, there is minimal potential for overlap between requirements under MIPS and the APM for these MIPS eligible clinicians.

We agree with commenters that we should continue to consider whether there are opportunities for additional APMs, including existing episode payment models, to become MIPS APMs. As we work toward that goal we believe we should move forward with the policy to avoid potentially duplicative or conflicting reporting or incentives for MIPS eligible clinicians participating in APMs that currently meet the MIPS APM criteria. In the future, we may consider amending existing APMs to meet MIPS APM criteria. However, as stated in the previous response, we do not believe that application of the APM scoring standard should be expanded to include MIPS eligible clinicians such as Affiliated Practitioners whose roles are not directly linked to quality and cost/utilization measures under the APM, or that the MIPS APM criteria should be expanded to include APMs that do not tie payment incentives to performance on quality and cost/utilization measures or APMs (such as CJR) that do not require APM Entities to have at least one eligible clinician on a Participation List. In these instances, we do not believe the requirements of the APM are sufficiently connected to MIPS reporting requirements and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

scoring such that there is significant potential for duplicative reporting or conflicting incentives between the APM and MIPS, the avoidance of which is the underlying purpose of the APM scoring standard.

Comment: Two commenters requested that CMS clarify that the MIPS APM payment adjustments resulting from the MIPS APM scoring standard will not be included in the Shared Savings Program and Next Generation ACO Model expenditures for benchmark calculations.

Response: MIPS payment adjustments resulting from the APM scoring standard are the same as MIPS adjustments for all other MIPS eligible clinicians. There are no unique “MIPS APM payment adjustments.” Rather, the APM scoring standard is only a particular scoring methodology for deriving a final score that results in a MIPS payment adjustment for an eligible clinician. Each APM has its own benchmarking methodology—benchmarking is not necessarily standard across APMs. Making a single determination with respect to the use of MIPS payment adjustments in APM benchmarking is outside the scope of this final rule with comment period.

Comment: One commenter suggested that CMS create an “Other Payer MIPS APM” category.

Response: We appreciate the idea of allowing MIPS scoring to be affected by participation in certain payment arrangements with other payers and we may consider the feasibility of doing so in the future in concert with the introduction of the All-Payer Combination Option.

After considering these comments, we are finalizing the criteria for an APM to be a MIPS APM as proposed with one modification to the first criterion in order to encompass APMs with terms defined through law or regulation. MIPS APMs are APMs that meet the following criteria:

- (1) APM Entities participate in the APM under an agreement with CMS or by law or regulation;
- (2) the APM requires that APM Entities include at least one MIPS eligible clinician on a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Participation List; and (3) the APM bases payment incentives on performance (either at the APM Entity or eligible clinician level) on cost/utilization and quality measures.

Below we describe in detail how MIPS APM participants will be identified from an APM Participation List to be included in the APM Entity group under the APM scoring standard.

We are also finalizing the proposal that the APM scoring standard does not apply to MIPS eligible clinicians who are not on a Participation List for an APM Entity group in a MIPS APM. MIPS eligible clinicians who are not part of the APM Entity group to which the APM scoring standard applies may choose to report to MIPS as individuals or groups according to the generally applicable MIPS rules.

## (2) APM Scoring Standard Performance Period

We proposed that the performance period for MIPS eligible clinicians participating in MIPS APMs would match the generally applicable performance period for MIPS proposed in section II.E.4. of the proposed rule. We proposed this policy would apply to all MIPS eligible clinicians participating in MIPS APMs (those that meet the criteria specified in section II.E.5.h.1. of the proposed rule) except in the case of a new MIPS APM for which the first APM performance period begins after the start of the corresponding MIPS performance period. In this instance, the participating MIPS eligible clinicians in the new MIPS APM would submit data to MIPS in the first MIPS performance period for the APM either as individual MIPS eligible clinicians or as a group using one of the MIPS data submission mechanisms for all four performance categories, and report to us using the APM scoring standard for subsequent MIPS performance period(s). Additionally, we anticipate that there might be MIPS APMs that would not be able to use the APM scoring standard (even though they met the criteria for the APM scoring standard and were treated as a MIPS APMs in the prior MIPS performance period) in their last year of operation because of technical or resource issues. For example, a MIPS APM in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

its final year may end earlier than the end of the MIPS performance period (proposed to be December 31). We might not have continuing resources dedicated or available to continue to support the MIPS APM activities under the APM scoring standard if the MIPS APM ends during the MIPS performance period. Therefore, if we determine it is not feasible for the MIPS eligible clinicians participating in the APM Entity to report to MIPS using this APM scoring standard in an APM's last year of operation, the MIPS eligible clinicians in the MIPS APM would need to submit data to MIPS either as individual MIPS eligible clinicians or as a group using one of the MIPS data submission mechanisms for the applicable performance period. We proposed that the eligible clinicians in the MIPS APM would be made aware of this decision in advance of the relevant MIPS performance period.

The following is a summary of the comments we received regarding our proposal that the APM scoring standard performance period will be same as the MIPS performance period.

Comment: A few commenters recommended CMS maintain consistency between the reporting period for MIPS and MIPS APMs to reduce administrative burden, and a commenter supported the same 12-month performance period for use by MIPS and APMs. One commenter requested a 90-day reporting period for 2017.

Response: We agree with the commenters that aligning the performance periods reduces administrative burden. We will maintain the 12-month performance period for the APM scoring standard, but data submitted for the advancing care information and, if necessary, improvement activities performance categories will follow the generally applicable MIPS data submission requirements regarding the number of measures and activities required to be reported during the performance period in order to receive a score for these performance categories. The quality performance category data for MIPS APMs will be submitted in accordance with the specific reporting requirements of the APM, which for most MIPS APMs covers the same 12-month

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance period that will be used for the APM scoring standard.

Comment: Two commenters requested CMS provide guidance for eligible clinicians in a MIPS APM that closes before the end of the performance period.

Response: We will post the list of MIPS APMs prior to the first day of the MIPS performance period for each year. If the APM would have qualified as a MIPS APM but the APM is ending before the end of the performance period, then the APM will not appear on this list. We will notify participants in any such APMs in advance of the start of the performance period if they will need to report to MIPS using the MIPS individual or group reporting option.

We are finalizing the APM scoring standard performance period to align with the MIPS performance period.

### (3) How the APM Scoring Standard Differs from the Assessment of Groups and Individual MIPS Eligible Clinicians under MIPS

We believe that establishing an APM scoring standard under MIPS will allow APM Entities and their participating eligible clinicians to focus on the goals and objectives of the MIPS APM to improve quality and lower costs of care while avoiding potentially conflicting incentives and duplicative reporting that could occur as a result of having to submit separate or additional data to MIPS. The APM scoring standard we proposed is similar to group assessment under MIPS as described in section II.E.3.d. of the proposed rule, but would differ in one or more of the following ways: (1) depending on the terms and conditions of the MIPS APM, an APM Entity could be comprised of a sole MIPS eligible clinician (for example, a physician practice with only one eligible clinician could be considered an APM Entity); (2) the APM Entity could include more than one unique TIN, as long as the MIPS eligible clinicians are identified as participants in the APM by their unique APM participant identifiers; (3) the composition of the APM Entity group could include APM participant identifiers with TIN/NPI

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

combinations such that some MIPS eligible clinicians in a TIN are APM participants and other MIPS eligible clinicians in that same TIN are not APM participants. In contrast, assessment as a group under MIPS requires a group to be comprised of at least two MIPS eligible clinicians who have assigned their billing rights to a TIN. It also requires that all MIPS eligible clinicians in the group use the same TIN.

In addition to the APM Entity group composition being potentially different than that of a group as generally defined under MIPS, we proposed for the APM scoring standard that we would generate a MIPS final score by aggregating all scores for MIPS eligible clinicians in the APM Entity that is participating in the MIPS APM to the level of the APM Entity. As we explained in the proposed rule, we believe that aggregating the MIPS performance category scores at the level of the APM Entity is more meaningful to, and appropriate for, these MIPS eligible clinicians because they have elected to participate in a MIPS APM and collectively focus on care transformation activities to improve the quality of care.

Further, depending on the type of MIPS APM, we proposed that the weights assigned to the MIPS performance categories under the APM scoring standard for MIPS eligible clinicians who are participating in a MIPS APM may be different from the performance category weights for MIPS eligible clinicians not participating in a MIPS APM for the same performance period. For example, we proposed that under the APM scoring standard, the weight for the cost performance category will be zero and that for certain MIPS APMs, the weight for the quality performance category will be zero for the 2019 payment year. Where the weight for the performance category is zero, neither the APM Entity nor the MIPS eligible clinicians in the MIPS APM would need to report data in these categories, and we would redistribute the weights for the quality and cost performance categories to the improvement activities and advancing care information performance categories to maintain a total weight of 100 percent.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

To implement certain elements of the APM scoring standard, we need to use the Shared Savings Program (section 1899 of the Act) and CMS Innovation Center (section 1115A of the Act) authorities to waive specific statutory provisions related to MIPS reporting and scoring. Section 1899(f) of the Act authorizes waivers of title XVIII requirements as may be necessary to carry out the Shared Savings Program, and section 1115A(d)(1) of Act authorizes waivers of title XVIII requirements as may be necessary solely for purposes of testing models under section 1115A of the Act. For each section in which we proposed scoring methodologies and waivers to enable the proposed approaches, we described how the use of waivers is necessary under the respective waiver authority standards. The underlying purpose of APMs is for CMS to pay for care in ways that are unique from FFS payment and to test new ways of measuring and assessing performance. If the data submission requirements and associated adjustments under MIPS are not aligned with APM-specific goals and incentives, the participants receive conflicting messages from us on priorities, which could create uncertainty and severely degrade our ability to evaluate the impact of any particular APM on the overall cost and quality of care. Therefore, we explained our belief that, for the reasons stated in section II.E.5.h. of the proposed rule certain waivers are necessary for testing and operating APMs and for maintaining the integrity of our evaluation of those APMs.

In the proposed rule we noted that for at least the first performance year, we do not anticipate that any APMs other than those under sections 1115A or 1899 of the Act would meet the criteria to be MIPS APMs. In the event that we do anticipate other types of APMs (demonstrations under section 1866C of the Act or required by federal law) will become MIPS APMs for a future year, we will address MIPS scoring for eligible clinicians in those APMs in future rulemaking.

The following is a summary of the comments we received regarding our proposals to use

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the Shared Savings Program (section 1899 of the Act) and CMS Innovation Center (section 1115A of the Act) authorities to waive specific statutory provisions related to MIPS reporting and scoring to implement the APM Scoring Standard for MIPS APMs and to apply the MIPS final score at the APM Entity level.

Comment: A few commenters expressed support for CMS' use of waiver authorities to establish the APM scoring standard. Several commenters also supported the proposal to calculate the final score at the APM Entity level. One commenter supported averaging scores for all clinicians in a MIPS APM Entity for purposes of the MIPS payment adjustment. A few commenters had concerns about aggregating all data for the clinicians linked to an APM Entity, and one commenter recommended that the APM scoring standard be optional.

Response: We continue to believe the final score derived at the APM Entity level should be the score used for purposes of determining the MIPS payment adjustment for each MIPS eligible clinician in that APM Entity group. As part of their participation in any MIPS APM, eligible clinicians should be working collaboratively and advancing shared care goals for aligned patients. We believe this collaboration toward shared goals under the MIPS APM differentiates these MIPS eligible clinicians from those in a MIPS group defined by a billing TIN, and supports our proposal to score these clinicians as a group.

The APM Entity final score is derived by aggregating the scores for each of the performance categories as applicable. For example, if the CPC+ model is determined to be a MIPS APM, participating MIPS eligible clinicians in CPC+ will not be evaluated in the cost and quality performance categories, which will have a zero weight for the first performance year. In this example, the final score will be calculated for MIPS eligible clinicians at the APM Entity level by adding the weighted advancing care information score and the assigned improvement activities score for the MIPS APM (see below for the final policies on the scoring for these

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance categories). This same final score calculated at the APM Entity level will be applied to each MIPS eligible clinician TIN/NPI combination in the APM Entity as identified on the APM Entity's Participation List.

Comment: A commenter requested clarification on how reporting will be accomplished with groups where MIPS eligible clinicians participate in multiple APMs, especially multiple Advanced APMs.

Response: As finalized in section II.E.6. of this final rule with comment period, if a single TIN/NPI combination for a MIPS eligible clinician is in two or more MIPS APMs, we will use the highest final score to determine the MIPS payment adjustment for that MIPS eligible clinician. MIPS adjustments apply to the TIN/NPI combination, so to the extent that a MIPS eligible clinician (NPI) participates in multiple MIPS APMs with different TINs, each of those TIN/NPI combinations would be assessed separately under each respective APM Entity.

We are finalizing the proposal to use the Shared Savings Program and CMS Innovation Center authorities under sections 1899 and 1115A of the Act, respectively, to waive specific statutory requirements related to MIPS reporting and scoring in order to implement the APM scoring standard. We note that although we proposed to use our authority under section 1899(f) of the Act to waive these statutory requirements in order to implement the APM scoring standard for MIPS eligible clinicians participating in Shared Savings Program ACOs, we believe we could also use our authority under section 1899(b)(3)(D) of the Act to accomplish this result. Section 1899(b)(3)(D) of the Act allows us to incorporate reporting requirements under section 1848 of the Act into the reporting requirements for the Shared Savings Program, as we determine appropriate, and to use alternative criteria than would otherwise apply. Thus, we believe that section 1899(b)(3)(D) of the Act also provides authority to apply the APM scoring standard for MIPS eligible clinicians participating in a Shared Savings Program ACO rather than requiring

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

these MIPS eligible clinicians to report individually or as a group using one of the MIPS data submission mechanisms.

We are also finalizing our proposal to score MIPS eligible clinicians in the MIPS APM at the APM Entity level. The final score calculated at the APM Entity level will be applied to each MIPS eligible clinician in the APM Entity group.

#### (4) APM Participant Identifier and Participant Database

To ensure we have accurately captured performance data for all of the MIPS eligible clinicians that are participating in an APM, we proposed to establish and maintain an APM participant database that would include all of the MIPS eligible clinicians who are part of the APM Entity. We would establish this database to track participation in all APMs, in addition to specifically tracking participation in MIPS APMs and Advanced APMs. We proposed that each APM Entity be identified in the MIPS program by a unique APM Entity identifier, and we also proposed that the unique APM participant identifier for a MIPS eligible clinician would be a combination of four identifiers including: (1) APM identifier established by CMS (for example, AA); (2) APM Entity identifier established by CMS (for example, A1234); (3) the eligible clinician's billing TIN (for example, 123456789); and (4) NPI (for example, 111111111). The use of the APM participant identifier will allow us to identify all MIPS eligible clinicians participating in an APM Entity, including instances in which the MIPS eligible clinicians use a billing TIN that is shared with MIPS eligible clinicians who are not participating in the APM Entity. In the proposed rule, we stated that we would plan to communicate to each APM Entity the MIPS eligible clinicians who are included in the APM Entity group in advance of the applicable MIPS data submission deadline for the MIPS performance period.

Under the Shared Savings Program, each ACO is formed by a collection of Medicare-enrolled TINs (ACO participants). Under our regulation at 42 CFR 425.118, all Medicare

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

enrolled individuals and entities that have reassigned their rights to receive Medicare payment to the TIN of the ACO participant must agree to participate in the ACO and comply with the requirements of the Shared Savings Program. Because all providers and suppliers that bill through the TIN of an ACO participant are required to agree to participate in the ACO, all MIPS eligible clinicians that bill through the TIN of an ACO participant are considered to be participating in the ACO. For purposes of the APM scoring standard, the ACO would be the APM Entity. The Shared Savings Program has established criteria for determining the list of eligible clinicians participating under the ACO, and we would use the same criteria for determining the list of MIPS eligible clinicians included in the APM Entity group for purposes of the APM scoring standard.

We recognize that there may be scenarios in which MIPS eligible clinicians may change TINs, use more than one TIN for billing Medicare, change their APM participation status, and/or change other practice affiliations during a performance period. Therefore, we proposed that only those MIPS eligible clinicians who are on the Participation List for the APM Entity in a MIPS APM on December 31 (the last day of the performance period) would be considered part of the APM Entity group for purposes of the APM scoring standard. Consequently, MIPS eligible clinicians who are not listed as participants of an APM Entity in a MIPS APM at the end of the performance period would need to submit data to MIPS through one of the MIPS data submission mechanisms and would have their performance assessed either as individual MIPS eligible clinicians or as a group for all four MIPS performance categories. For example, under the proposal, a MIPS eligible clinician who participates in the APM Entity on January 1, 2017, and leaves the APM Entity on June 15, 2017, would need to submit data to MIPS using one of the MIPS data submission mechanisms and would have their performance assessed either as an individual MIPS eligible clinician or as part of a group. This approach for defining the applicable

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

group of MIPS eligible clinicians was consistent with our proposal for identifying eligible clinician groups for purposes of QP determinations outlined in section II.F.5.b. of the proposed rule; the group of eligible clinicians we use for purposes of a QP determination would be the same as that used for the APM scoring standard. This would be an annual process for each MIPS performance period.

The following is a summary of the comments we received regarding our proposals to establish an APM participant identifier, a CMS database to identify and track the APM participants, and the dates that we will use to determine if an MIPS APM eligible clinician will be included in the MIPS APM for purposes of MIPS reporting under the APM scoring standard.

Comment: A commenter suggested CMS use the current CMS enrollment infrastructure such as PECOS to identify and track APM participants to provide an incentive for eligible clinicians to update their Medicare enrollment information, which in turn would provide CMS with more accurate data on the MIPS eligible clinicians that are in a MIPS APM.

Response: We will be using existing systems to the extent feasible to ensure we have accurate data on MIPS eligible clinicians and APM participants. Depending on the results of our assessment of available data and systems, we may or may not include any particular system, such as PECOS.

Comment: A number of commenters supported the use of an APM participant identifier that includes the TIN and NPI for the MIPS APM eligible clinicians and urged collaboration with vendors to build a useful infrastructure. One commenter thought CMS should simplify this APM participant identifier. Two commenters encouraged CMS to make the APM participant identifiers available to stakeholders in real time via an Application Program Interface (API). One commenter indicated the APM participant identifier would add administrative complexity. Another commenter encouraged CMS to make sure there is a consistent approach to identifying

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

both APM and MIPS participants.

Response: We believe the use of the APM participant identifier will ensure we use accurate information regarding MIPS eligible clinicians and their participation in APMs, and we believe that this will reduce administrative complexity by reducing ambiguity. We appreciate the suggestion to make the APM participant identifier available via an API, and we are exploring a variety of methods to communicate this information.

Comment: A few commenters were opposed to the December 31 date for determining if the APM Entity participant would be included in the MIPS APM for purposes of the APM scoring standard. A commenter did not support this proposal because MIPS eligible clinicians could be excluded if they were participating throughout the year but not on December 31st. One commenter suggested that the eligible clinician should be included in the group if they were in the MIPS APM for more than half of the performance period and another commenter suggested they be considered as participating in the group if they were in the MIPS APM for 90 days. Yet another commenter stated that CMS's proposed policy for determining who participates in a given APM does not sufficiently respond to the often complex billing relationships clinicians maintain across TINs, and that these complex billing relationships are especially true for academic medical center clinicians who often relocate due to changes in employment based on the academic year. The commenter suggested having a more flexible list of dates for updating the list of MIPS eligible clinicians participating in a MIPS APM (and therefore subject to the APM scoring standard) or looking at claims rather than Participation Lists.

Response: We agree with the commenters that only using the December 31 date to determine whether an eligible clinician is a MIPS APM participant could potentially impact a clinician's decision on whether or when to leave a MIPS APM and their ability to report to MIPS if they leave the MIPS APM prior to the end of the performance period. We also recognize that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

an eligible clinician who participates in a MIPS APM in the first 6 months of the performance period and then leaves the MIPS APM may have difficulty reporting to MIPS independent of the APM Entity. If the MIPS eligible clinician leaves the MIPS APM and joins a group or another APM that is not a MIPS APM, the individual would likely be included in the new group's MIPS reporting. But if the MIPS eligible clinician does not join another group, then they would need to report to MIPS as an individual. In such a case, the MIPS eligible clinician may not be able to meet one or more of the MIPS performance category reporting requirements. For example, a MIPS eligible clinician who used CEHRT in an APM Entity through July of a performance period may not have the CEHRT available to report the advancing care information performance category as an individual MIPS eligible clinician during the MIPS submission period. We are revising the points in time at which we will assess whether a MIPS eligible clinician is on a Participation List for purposes of the APM scoring standard. We will review the Participation Lists for MIPS APMs on March 31, June 30, and August 31. A MIPS eligible clinician on the Participation List for an APM Entity in a MIPS APM on at least one of these three dates will be included in the APM Entity group for the purpose of the APM scoring standard. For example, if the Oncology Care Model (OCM) is determined to be a MIPS APM, a MIPS eligible clinician who is identified on the Participation List of an APM Entity participating in OCM from January 1 through April 25 of the performance year would be included in the APM Entity group for purposes of the APM scoring standard for that performance year.

Comment: A commenter requested clarification on whether a MIPS eligible clinician who participates in a MIPS APM for part of the year but leaves prior to the end of the performance period is allowed to submit a partial year of MIPS data for the time they were not in the MIPS APM.

Response: As discussed in section II.F.5. of this final rule with comment period, we are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adopting a modified version of the proposed policy for defining the APM Entity group, which will be applicable to both QP determinations and the APM scoring standard. Under the final policy, if a MIPS eligible clinician is on the APM Participation List on at least one of the APM participation assessment (Participation List “snapshot”) dates, the MIPS eligible clinician will be included in the APM Entity group for purposes of the APM scoring standard for the applicable performance year. If the MIPS eligible clinician is not on the APM Entity’s Participation List on at least one of the snapshots dates (March 31, June 30, or August 31), then the MIPS eligible clinician will need to submit data to MIPS using the MIPS individual or group reporting option and adhere to all generally applicable MIPS data submission requirements to avoid a negative payment adjustment. Therefore, if the applicable data submission requirements include full-year reporting, the MIPS individual or group would need to report for the full year.

Comment: A commenter recommended that CMS: (1) allow ACOs to report quality data and other information for MIPS on behalf of participating clinicians who join an ACO mid-performance year but are not included on the ACO Participation List until the following year, and (2) hold harmless from negative MIPS payment adjustments those clinicians who join the ACO mid-performance year but are not included on the ACO Participation List until the following year. Another commenter requested that MIPS APM participants who leave prior to the end of the performance period be exempt from MIPS reporting because this may hinder employment mobility. Some commenters suggested CMS indemnify clinicians who joined an ACO mid-year from any negative MIPS payment adjustments because the commenters believe these clinicians should not be penalized for the hard work they put into the APM during the year solely because they joined the APM Entity after the start of the performance year.

Response: Each APM has specific rules as to when participants can be added or removed from Participation Lists. If the MIPS eligible clinician is on the MIPS APM Participation List on

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

at least one of the three snapshot dates (March 31, June 30, or August 31), then the MIPS eligible clinician will be included in the APM Entity group and scored according to the APM scoring standard for purposes of MIPS for that performance year. Once an eligible clinician is determined to be part of the APM Entity group in a MIPS APM at one of the snapshot dates, the eligible clinician will be part of the group for purposes of MIPS and the APM scoring standard for that performance period even if they leave the APM Entity at a later date.

Comment: A commenter requested clarification about whether the APM Entities will submit new Participation Lists for the purpose of MIPS or if CMS will use Participation Lists submitted for the MIPS APM. One commenter indicated it may be easier if the APM Entity provides CMS with the list of MIPS APM participants. Another commenter suggested that instead of using a Participation List CMS should design other approaches to discern which eligible clinicians are in an APM Entity.

Response: We will use the Participation Lists that the APM Entity provides to us in accordance with the particular MIPS APM's rules. Each APM has particular rules for how the Participation Lists may be updated during a performance year to reflect the APM Entities and their participating eligible clinicians, as identified by their TIN/NPI combinations. We will maintain these Participation Lists for each APM in a dedicated database, and we will use the same Participation Lists for operational purposes within the APM, for QP determinations, and to determine which MIPS eligible clinicians are in the APM Entity group for purposes of the APM scoring standard. Therefore, APM Entities such as ACOs would not be required to submit any additional Participant Lists for purposes of the Quality Payment Program.

Comment: A commenter requested CMS provide clear guidance as to how each eligible clinician would be scored if they are a QP in a MIPS APM so they can make informed decisions regarding APM participation.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: An eligible clinician who becomes a QP is exempt from MIPS reporting requirements and the payment adjustment for the applicable payment year. For example, if the eligible clinician is determined to be a QP for the 2019 payment year based on 2017 performance, then the clinician is exempt from a MIPS payment adjustment in 2019 and does not need to report data to MIPS data for the 2017 performance period.

We are finalizing the use of the proposed APM participant identifier to define the APM Entity group that is participating in a MIPS APM. The APM Participation List information will be stored in a database so that, among other uses, we can identify and include the appropriate MIPS eligible clinicians in an APM Entity group to which the APM scoring standard applies. We are revising our proposal to use December 31 as the date on which an eligible clinician must appear on the Participation List to be included in the APM Entity group for a MIPS APM. Instead of identifying MIPS eligible clinicians participating in a MIPS APM at a single point in time on December 31 of the performance year, we will review the MIPS APM Participation Lists on March 31, June 30 and August 31. All eligible clinicians who appear on an APM Entity's list for a MIPS APM on at least one of those three dates will be included in the APM Entity group for purposes of the APM scoring standard for the year. We describe the determination of the APM Entity group in full detail in section II.F.5. of this final rule with comment period.

#### (5) APM Entity Group Scoring for the MIPS Performance Categories

As mentioned previously, section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities under the following performance categories: (1) quality; (2) cost; (3) improvement activities; and (4) advancing care information. We proposed at §414.1370 to calculate one final score that is applied to the billing TIN/NPI combination of each MIPS eligible clinician in the APM Entity group. Therefore, each APM Entity group (for example, the MIPS eligible clinicians in a Shared Savings Program ACO or an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Oncology Care Model practice) would receive a score for each of the four performance categories according to the proposals described in the proposed rule, and we would calculate one final score for the APM Entity group. The APM Entity group score would be applied to each MIPS eligible clinician in the group, and subsequently used to develop the MIPS payment adjustment that is applicable to each MIPS eligible clinician in the group. Thus, the final score for the APM Entity group and the participating MIPS eligible clinician score are the same. For example, in the Shared Savings Program, the MIPS eligible clinicians in each ACO would be an APM Entity group. That group would receive a single final score that would be applied to each of its participating MIPS eligible clinicians. Similarly, in the OCM, the MIPS eligible clinicians identified on an APM Entity's Participation List would comprise an APM Entity group. That group would receive a single final score that would be applied to each of the MIPS eligible clinicians in the group. We note that this APM Entity group final score is not used to evaluate eligible clinicians or the APM Entity for purposes of incentives within the APM, shared savings payments, or other potential payments under the APM, and we currently do not foresee APMs using the final score for purposes of evaluation within the APM. Rather, the APM Entity group final score would be used only for the purposes of the APM scoring standard under MIPS. It should be noted that although we proposed that the APM scoring standard would only apply to participants in MIPS APMs, MIPS eligible clinicians that participate in an APM (including but not limited to a MIPS APM) and submit either individual or group level data to MIPS earn a minimum score of 50 percent of the highest potential improvement activities performance category score as long as such MIPS eligible clinicians are on a list of participants for an APM and are identifiable by the APM participant identifier.

We explained in the proposed rule that we want to avoid situations in which different MIPS eligible clinicians in the same APM Entity group receive different MIPS scores. APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Entities have a goal of collective success under the terms of the APM, so having a variety of differing MIPS adjustments for eligible clinicians within that collective unit would undermine the intent behind the APM to test a departure from a purely FFS system based on independent clinician activity.

We proposed, for the first MIPS performance period, a specific scoring and reporting approach for the MIPS eligible clinicians participating in MIPS APMs, which would include the Shared Savings Program, the Next Generation ACO Model, and other APMs that meet the proposed criteria for a MIPS APM. In the proposed rule, we described the APM Entity data submission requirements and proposed a scoring approach for each of the MIPS performance categories for specific MIPS APMs (the Shared Savings Program, Next Generation ACO Model, and all other MIPS APMs).

The following is a summary of the comments we received regarding our proposal to calculate one final score per APM Entity group in a MIPS APM, and to apply that final score to each MIPS eligible clinician (identified by the billing TIN/NPI combination) in the APM Entity group and our proposal to give one-half of the maximum improvement activities score to any MIPS eligible clinicians who are on a list of participants and identified by the APM participant identifier, regardless of whether they participate in an Advanced APM, MIPS APM, or other APM.

Comment: A number of commenters supported our proposal. Another commenter was concerned that in a group, poor performance by some eligible clinicians may affect the final score for other eligible clinicians who perform better. A commenter suggested that CMS allow APM participants to receive the MIPS score that is the higher of the APM Entity group score and the group TIN score.

Response: As previously discussed, we are finalizing MIPS APM scoring at the APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Entity level, and the final score will be applied to each TIN/NPI combination in the APM Entity group. In any group reporting structure, the resulting final score reflects the collective performance of the group. Unless all APM Entity group members score exactly equally, some will receive higher or lower final scores than they would have achieved individually. We believe that, although some group members' lower final scores may offset the final score for higher performers in the APM Entity, the APM Entity level score appropriately reflects the aggregate performance of the eligible clinicians in the APM Entity. APMs are premised on a group of MIPS eligible clinicians working together to collectively achieve the goals of the APM, and providing different MIPS payment adjustments within an APM Entity is not consistent with those goals.

Under specific circumstances, described below, in which a Shared Savings Program ACO fails to report quality under the Shared Savings Program requirements, participant TINs of such ACOs would be considered the APM Entity groups for purposes of the APM scoring standard. Even under this exception, those TIN groups would still be scored as a cohesive unit, with no individual final score variation within the TIN.

Comment: A commenter supported allowing participants in other APMs, such as the Accountable Health Communities Model, to receive improvement activities credit. A few commenters requested that CMS clarify how eligible clinicians and groups participating in APMs that are not MIPS APMs would receive credit for APM participation in the improvement activities category.

Response: MIPS eligible clinicians that participate in an APM that is not a MIPS APM will need to be identified by their APM participant identifier on a CMS-maintained list during the MIPS performance year in order to receive one-half of the maximum improvement activities score for APM participation. This list may be a Participation List, an Affiliated Practitioner List,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

or another CMS-maintained list, as applicable. Such CMS-maintained lists define APM participation; therefore, MIPS eligible clinicians are not considered to be participating in an APM unless included on a CMS-maintained list. We will notify APM Entities in advance of the first day of the performance period if the APM utilizes such a list. If the specific APM does utilize such a list, then the MIPS eligible clinicians will be eligible for the improvement activities credit.

Comment: A commenter requested that CMS clarify in the final rule with comment period that a rheumatologist participating in other APMs not listed as an Advanced or MIPS APM in this proposed rule would receive one-half of the maximum improvement activities score for such participation.

Response: As stated above, an eligible clinician that participates in an APM, even one that is not an Advanced APM or MIPS APM, would still receive one-half the maximum score for improvement activities through APM participation. CMS defines participation in APMs by presence on a CMS-maintained list associated with an APM. Therefore, we will use those lists to validate the APM participation improvement activities credit.

Comment: A number of commenters supported scoring MIPS eligible clinicians at the APM Entity level, and other commenters supported scoring MIPS eligible clinicians at the TIN level. A commenter stated that evaluating APM Entities, such as ACOs, at the APM Entity level reinforces the APM Entity purpose and avoids fractures within the APM Entity. Another commenter recommended CMS have all ACOs scored at the APM Entity level for the advancing care information performance category to recognize that the health information technology work in most APMs is best measured as a whole. A few commenters requested that the APM participants have a choice as to being scored at the APM Entity level or participant TIN level. A commenter further suggested that scoring at the APM Entity level instead of the participant TIN

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

level overstates the relationship between these clinicians. One commenter stated that the policies in which the primary TIN for an ACO reports the primary-care focused CMS Web Interface measures result in a double standard whereby specialists in ACOs are not held to the same individual level of accountability as those in small group or solo practices where reporting is done at the individual clinician level.

Response: We believe that APM Entities should be scored at the APM Entity level because the APM Entity is a group of eligible clinicians focused on achieving the collective goals of the APM, which include shared responsibility for cost and quality. That stated, we specifically recognize that there may be rare instances in which an ACO in the Shared Savings Program may fail to report quality as required by the Shared Savings Program, which would adversely impact the MIPS final score of all MIPS eligible clinicians billing under ACO participant TINs. Accordingly, in the event that a Shared Savings Program ACO does not report quality measures as required by the Shared Savings Program, scoring under the APM scoring standard would be calculated at the ACO participant TIN level for MIPS eligible clinicians in that ACO, and each of the ACO participant TINs would receive its own TIN-level final score instead of an APM Entity-level final score. We note, however, that our final policy would not cancel or mitigate any of the negative consequences associated with non-reporting on quality as required under the Shared Savings Program, including ineligibility for shared savings payments and/or potential termination of the ACO from the program.

We are finalizing our proposal to calculate one final score at the APM Entity level that will be applied to the billing TIN/NPI combination of each MIPS eligible clinician in the APM Entity group. We are also finalizing our policy to give one-half of the maximum improvement activities score to eligible clinicians who are APM participants, with the clarification that we would extend such improvement activities scoring credit to any MIPS eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

identified by an APM participant identifier on a Participation List, an Affiliated Practitioners List, or other CMS-maintained list of participants at any time during the MIPS performance period.

In the event that a Shared Savings Program ACO does not report quality measures as required under the Shared Savings Program regulations, then scoring on all MIPS performance categories will be at the ACO participant TIN level, and the resulting TIN-level final score will be applied to each of its constituent TIN/NPI combinations. For purposes of both the Shared Savings Program quality performance requirement and the APM scoring standard, any “partial” reporting of quality measures through the CMS Web Interface that does not satisfy the quality reporting requirements under the Shared Savings Program will be considered a failure to report. We note that in this scenario, each ACO participant TIN would need to report quality data to MIPS according to MIPS group reporting requirements in order to avoid a score of zero for the quality performance category.

We believe that this exception for the Shared Savings Program recognizes the recommendations of several commenters that the APM scoring standard should apply at the TIN level and concerns that in some cases ACOs are not representative of the potentially widely-varying MIPS performance across ACO participant TINs. Although we maintain that the APM Entity-level scoring is generally appropriate to reflect the collective goals and responsibilities of the group, we believe that ACOs that fail to report quality as required under the Shared Savings Program do not necessarily represent the quality performance of their constituent TINs. Therefore, we believe it is appropriate in such cases to allow ACO participant TINs to avoid a score of zero in the quality performance category and to take responsibility for their own MIPS reporting and scoring independent of the ACO and other TINs in the ACO. Further, this policy is generally consistent with similar policies that have been proposed for ACO participant TINs

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

under PQRS and the Value Modifier program at (81 FR 46408-46409, 46426-46427).

Additionally, we recognize that there may be instances when an APM Entity's participation in the APM is terminated during the MIPS performance period. As we state in section II.F.5. of this final rule with comment period, we will not make the first assessment to determine whether a MIPS eligible clinician is on an APM Entity's Participation List until March 31 of the performance period. Therefore if an APM Entity group terminates its participation in the APM prior to March 31, the MIPS eligible clinicians would not be considered part of an APM Entity group for purposes of the APM scoring standard.

If an APM Entity's participation in the APM is terminated on or after March 31 of a performance period, the MIPS eligible clinicians in the APM Entity group would still be considered an APM Entity group in a MIPS APM for the year, and would report and be scored under the APM scoring standard.

#### (6) Shared Savings Program – Quality Performance Category Scoring under the APM Scoring Standard

We proposed that beginning with the first MIPS performance period Shared Savings Program ACOs would only need to submit their quality measures to CMS once using the CMS Web Interface through the same process that they use to report to the Shared Savings Program to report quality measures to MIPS. These data would be submitted once but used for both the Shared Savings Program and for MIPS. Shared Savings Program ACOs have used the CMS Web Interface for submitting their quality measures since the program's inception, making this a familiar data submission process. The Shared Savings Program quality measure data reported to the CMS Web Interface would be used by CMS to calculate the MIPS quality performance category score at the APM Entity group level. The Shared Savings Program quality performance data that is not submitted to the CMS Web Interface, for example the CAHPS survey and claims-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

based measures, would not be included in the MIPS APM quality performance category score.

The MIPS quality performance category requirements and performance benchmarks for quality measures submitted via the CMS Web Interface would be used to determine the MIPS quality performance category score at the ACO level for the APM Entity group. We stated that we believe this would reduce the reporting burden for Shared Savings Program MIPS eligible clinicians by requiring quality measure data to be submitted only once and used for both programs.

In the proposed rule, we explained that we believe that no waivers are necessary to adopt this approach because the quality measures submitted via the CMS Web Interface under the Shared Savings Program are also MIPS quality measures and would be scored under MIPS performance standards. In the event that Shared Savings Program quality measures depart from MIPS measures in the future, we would address such changes including whether further waivers are necessary at such a time in future rulemaking.

The following is a summary of the comments we received regarding our proposal to have Shared Savings Program ACOs report quality measures to MIPS using the CMS Web Interface as they normally would under Shared Savings Program rules and our proposal to calculate the MIPS quality performance category score at the APM Entity group level based on the data reported by the ACO to the CMS Web Interface and using MIPS performance benchmarks.

Comment: A commenter wanted to know which set of APM scoring standard rules would apply to CPC+ practices that participate in both CPC+ and the Shared Savings Program. The commenter noted that if the reporting and scoring under the APM scoring standard for other MIPS APMs applies to the CPC+ practice, the quality performance category would be reweighted to zero. The commenter recommended that MIPS eligible clinicians who participate in both the CPC+ and the Shared Savings Program use the Shared Savings Program rules for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reporting and scoring under the APM scoring standard.

Response: In May 2016, CMS announced that practices may participate in both a CPC+ model and in an ACO participating in the Shared Savings Program. More information about dual participation may be found in the CPC+ FAQs or RFA at

<https://innovation.cms.gov/Files/x/cpcplus-practiceapplicationfaq.pdf> or

<https://innovation.cms.gov/Files/x/cpcplus-rfa.pdf>. For purposes of the APM scoring standard,

MIPS eligible clinicians in CPC+ practices that are also participating in a Shared Savings

Program ACO will be considered part of a Shared Savings Program ACO. CPC+ practices that

are part of a Shared Savings Program ACO will report quality to CPC+ as required by the CPC+

model but will not receive the CPC+ performance-based incentive payment. As part of a Shared

Savings Program ACO, CPC+ practices, along with the other ACO participants, will be subject

to the payment incentives for cost and quality under the Shared Savings Program. Because CPC+

practices that participate in both the CPC+ model and the Shared Savings Program are not

eligible to receive the performance-based incentive payment under the CPC+ model,

responsibility for cost and quality is assessed more comprehensively under the Shared Savings

Program. Therefore, we believe that the Shared Savings Program participation of these “dual

participants” should determine the manner in which we assess them under the APM scoring

standard.

Comment: A commenter agreed with the proposed approach of not including CAHPS or

other non-CMS Web Interface quality data measures in the MIPS APM quality performance

category score for ACOs in the Shared Savings Program. Alternately, a commenter

recommended that CAHPS measures be included in Shared Savings Program ACO quality

performance category scores.

Response: Because CAHPS survey responses are not submitted to the CMS Web

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Interface and may not be available in time for inclusion in the MIPS quality performance category scoring, we are not including these measures in the MIPS quality performance category score for the ACOs in the Shared Savings Program and the Next Generation ACO Model.

Comment: One commenter requested clarification as to which quality measures, specifically whether MIPS population health measures, would be included in the APM scoring standard for Shared Savings Program ACOs.

Response: The MIPS population health measures will not be included in the quality performance category score for eligible clinicians participating in the Shared Savings Program, the Next Generation ACO Model or other MIPS APMs under the APM scoring standard.

Comment: A commenter requested that CMS ensure that all the MIPS eligible clinicians billing under the TIN of an ACO participant in a Shared Savings Program ACO receive the APM Entity group final score even though most ACO quality measures are for primary care physicians.

Response: All eligible clinicians that bill through the TIN of a Shared Savings Program ACO participant and are included on the Participant List on at least one of the three Participation List snapshot dates will receive the APM Entity group final score.

Comment: A commenter requested that all ACOs be exempt from the MIPS quality performance category because they are already being assessed for quality under the APM and also requested that Shared Savings Program Track 1 participants have the option to be exempt from MIPS.

Response: All MIPS eligible clinicians participating in the Shared Savings Program are subject to MIPS unless they are determined to be a QP or a Partial QP whose APM Entity elects not to report under MIPS. This includes MIPS eligible clinicians who are not participating in Advanced APMs. Under the APM scoring standard, MIPS eligible clinicians participating in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Shared Savings Program ACOs do not have to do any additional reporting to satisfy MIPS quality performance category reporting requirements.

We are finalizing our proposal that a Shared Savings Program ACO's quality data reported to the CMS Web Interface as required by Shared Savings Program rules will also be used for purposes of scoring the MIPS quality performance category using MIPS performance benchmarks. We note that for purposes of the Shared Savings Program quality reporting requirement and the APM scoring standard, any "partial" reporting of quality measures through the CMS Web Interface that does not satisfy the requirements under the Shared Savings Program will be considered a failure to report, triggering the exception finalized above in which we will separately assess each ACO participant TIN under the APM scoring standard.

#### (7) Shared Savings Program – Cost Performance Category Scoring under the APM Scoring Standard

We proposed that for the first MIPS performance period, we would not assess MIPS eligible clinicians participating in the Shared Savings Program (the MIPS APM) under the cost performance category. We proposed this approach because: (1) eligible clinicians participating in the Shared Savings Program are already subject to cost and utilization performance assessments under the APM; (2) the Shared Savings Program measures cost in terms of an objective, absolute total cost of care expenditure benchmark for a population of attributed beneficiaries, and participating ACOs may share savings and/or losses based on that standard, whereas the MIPS cost measures are relative measures such that clinicians are graded relative to their peers, and therefore different than assessing total cost of care for a population of attributed beneficiaries; and (3) the beneficiary attribution methodologies for measuring cost under the Shared Savings Program and MIPS differ, leading to an unpredictable degree of overlap (for eligible clinicians and for us) between the sets of beneficiaries for which eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

would be responsible that would vary based on unique APM Entity characteristics such as which and how many TINs comprise an ACO. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through an APM must take priority to ensure that the goals and program evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across Shared Savings Program and MIPS assessments—due to the differences in attribution, the inclusion in MIPS of episode-based measures that do not reflect the total cost of care, and the objective versus relative assessment factors listed above—creates uncertainty for MIPS eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of the Shared Savings Program.

For example, Shared Savings Program ACOs are held accountable for expenditure benchmarks that reflect the total Medicare Parts A and B spending for their assigned beneficiaries, whereas many of the proposed MIPS cost measures focus on spending for particular episodes of care or clinical conditions. We consider it a programmatic necessity that the Shared Savings Program has the ability to structure its own measurement and payment for performance on total cost of care independent from other incentive programs such as the cost performance category under MIPS. Thus, we proposed to reduce the MIPS cost performance category weight to zero for all MIPS eligible clinicians in APM Entities participating in the Shared Savings Program.

Accordingly, under section 1899(f) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Shared Savings Program—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category. With the proposed reduction of the cost performance category weight to zero, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

believed it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1899(f) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Shared Savings Program—the requirements under sections 1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such MIPS eligible clinicians.

Given the proposal to waive requirements under section 1848(q)(5)(E)(i)(II) of the Act in order to reduce the weight of the cost performance category to zero, we also needed to specify how that weight would be redistributed among the remaining performance categories in order to maintain a total weight of 100 percent. We proposed to redistribute the cost performance category weight to both the improvement activities and advancing care information performance categories as specified in Table 11 of this final rule with comment period. The MIPS cost performance category is proposed to have a weight of 10 percent for the first performance period. Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories, and in accordance with section 1848(q)(5)(E)(i)(I) and (II) of the Act, the weight for this category will be reduced from 50 to 30 percent as of the 2021 MIPS payment period, we proposed to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories so that the distribution does not change the relative weight of the quality performance category. Because the MIPS quality performance category weight is required under the statute to be reduced to 30 percent after the first 2 years of MIPS, we believe that increasing the quality performance category weight would be incongruous in light of the eventual balance of the weights set forth in the statute. The redistributed cost performance category weight of 10 percent would result in a 5 percentage point increase (from 15 to 20 percent) for the improvement

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

activities performance category and a 5 percentage point increase (from 25 to 30 percent) for the advancing care information performance category. We invited comments on the proposed weights and specifically whether we should increase the MIPS quality performance category weight.

In the proposed rule we explained that as the MIPS cost performance category evolves over time, there might be greater potential for alignment and less potential duplication or conflict with MIPS cost measurement for MIPS eligible clinicians participating in APMs such as the Shared Savings Program. We will continue to monitor and consider how we might incorporate an assessment in the MIPS cost performance category into the APM scoring standard for MIPS eligible clinicians participating in the Shared Savings Program. We also understand that reducing the cost performance category weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information scores are higher than the scores these MIPS eligible clinicians would have received under the cost performance category, would result in higher final scores on average for MIPS eligible clinicians participating in the Shared Savings Program. We solicited comment on the possibility of assigning a neutral score to the Shared Savings Program APM Entity groups for the cost performance category to moderate MIPS final scores for APM Entities participating in the Shared Savings Program. We also generally solicited comment on our proposed policy, and on whether and how we should incorporate the cost performance category into the APM scoring standard under MIPS for eligible clinicians participating in the Shared Savings Program for future years.

The following is a summary of the comments we received regarding our proposal to reduce the MIPS cost performance category weight to zero for APM Entity groups participating in the Shared Savings Program.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Several commenters supported our proposal not to assess cost for MIPS APMs and our efforts to reduce duplicative measurement. One commenter suggested we give a full score for the cost performance category instead of redistributing the 10 percent weight to other MIPS performance categories. A few commenters recommended the 10 percent weight for the cost performance category be redistributed entirely to the improvement activities performance category.

One commenter recommended that MIPS eligible clinicians in Shared Savings Program ACOs receive extra credit in the cost performance category if their ACO achieved expenditures below its benchmark. The commenter suggested that CMS consider having a sliding scale of cost category points awarded to MIPS eligible clinicians that participate in Shared Savings Program ACOs with benchmarks of less than \$10,000 per beneficiary per year. One commenter proposed that CMS reward Shared Savings Program ACOs that score at or above the average on cost measures, and hold harmless Shared Savings Program ACOs scoring below average. One commenter was opposed to reducing the cost performance category weight to zero.

Response: We appreciate commenters' widespread support for this proposal to reduce the weight of the MIPS cost performance category to zero under the APM scoring standard for eligible clinicians participating in the Shared Savings Program. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost performance category into the APM scoring standard for eligible clinicians participating in the Shared Savings Program, we believe that assessment in this category would conflict with the assessment of the financial performance of ACOs participating in the Shared Savings Program at this time. Because ACOs in the Shared Savings Program are assessed through particular attribution and benchmarking methodologies for purposes of earning shared savings payments, we believe that adding additional and separate MIPS incentives around cost would be redundant, potentially

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

confusing, and could undermine the incentives built into the Shared Savings Program.

We are finalizing our proposal to reduce the cost performance category to zero percent for APM Entity groups in the Shared Savings Program and to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories. We note that this policy may seem unnecessary given that the MIPS policy for the initial performance year reduces the cost performance category weight to zero for all MIPS eligible clinicians. However, the zero weight for the cost performance category for APM Entity groups in the Shared Savings Program will remain in place for subsequent years unless we modify it through future notice and comment rulemaking, whereas the zero weight given to the cost performance category under the generally applicable MIPS scoring standard is limited to the first performance period, will increase to 10 percent in the second performance period, and will increase to 30 percent in the third performance period. We believe that setting this foundation from the outset of the Quality Payment Program will contribute to consistency and minimize uncertainty for MIPS APM participants at least until such a time as we might identify a means to consider performance in the MIPS cost performance category that is congruent with cost evaluation under the Shared Savings Program.

We further note that although we proposed to use our authority under section 1899(f) of the Act to waive the requirement under section 1848(q)(5)(E)(i)(II) of the Act to specify the scoring weight for the cost performance category because it was necessary to waive this requirement in order to ensure that the Shared Savings Program retains the ability to structure its own measurement and payment for performance on total cost of care independent of other incentive programs, we believe we could also use our authority under section 1899(b)(3)(D) of the Act to accomplish this result. Section 1899(b)(3)(D) of the Act allows us to incorporate reporting requirements under section 1848 into the reporting requirements for the Shared Savings

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Program, as we determine appropriate, and to use alternative criteria than would otherwise apply.

Thus, we believe that section 1899(b)(3)(D) of the Act also provides authority to reduce the weight of the cost performance category to zero percent for eligible clinicians participating in Shared Savings Program ACOs and to redistribute the 10 percent weight to the improvement categories and advancing care information categories.

#### (8) Shared Savings Program – Improvement Activities and Advancing Care Information Performance Category Scoring under the APM Scoring Standard

We proposed that MIPS eligible clinicians participating in the Shared Savings Program would submit data for the MIPS improvement activities and advancing care information performance categories through their respective ACO participant billing TINs independent of the Shared Savings Program ACO. Under section 1848(q)(5)(C)(ii) of the Act, all ACO participant group billing TINs would receive a minimum of one half of the highest possible score for the improvement activities performance category. Additionally, under section 1848(q)(5)(C)(i) of the Act, any ACO participant TIN that is determined to be a patient-centered medical home or comparable specialty practice will receive the highest potential score for the improvement activities performance category. The improvement activities and advancing care information scores from all the ACO participant billing TINs would be averaged to a weighted mean MIPS APM Entity group level score. We proposed to use a weighted mean in computing the overall improvement activities and advancing care information quality performance category score to account for difference in the size of each TIN and to allow each TIN to contribute to the overall score based on its size. Then all MIPS eligible clinicians in the APM Entity group, as identified by their APM participant identifiers, would receive that APM Entity score. The weights used for each ACO participant billing TIN would be the number of MIPS eligible clinicians in that TIN. Because all providers and suppliers that bill through the TIN of an ACO participant are required

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to agree to participate in the ACO, all MIPS eligible clinicians that bill through the TIN of an ACO participant are considered to be participating in the ACO. Any Shared Savings Program ACO participant billing TIN that does not submit data for the MIPS improvement activities and/or advancing care information performance categories would contribute a score of zero for each performance category for which it does not report; and that score would be incorporated into the resulting weighted average score for the Shared Savings Program ACO. All MIPS eligible clinicians in the ACO (the APM Entity group) would receive the same score that is calculated at the ACO level (the APM Entity level).

In the proposed rule, we recognized that the Shared Savings Program eligible clinicians participate as a complete TIN because all of the eligible clinicians that have reassigned their Medicare billing rights to the TIN of an ACO participant must agree to participate in the Shared Savings Program. This is different from other APMs, which may include APM Entity groups with eligible clinicians who share a billing TIN with other eligible clinicians who do not participate in the APM Entity. We solicited comment on a possible alternative approach in which improvement activities and advancing care information performance category scores would be applied to all MIPS eligible clinicians at the individual billing TIN level, as opposed to aggregated to the ACO level, for Shared Savings Program participants. We also indicated that if MIPS APM scores were applied to each TIN in an ACO at the TIN level, we would also likely need to permit those TINs to make the Partial QP election, as discussed elsewhere in this final rule with comment, at the TIN level. We proposed that under the APM scoring standard, the ACO-level APM Entity group score would be applied to each participating MIPS eligible clinician to determine the MIPS payment adjustment. We explained that we believe calculating the score at the APM Entity level mirrors the way APM participants are assessed for their shared savings and other incentive payments in the APM, but we understand there may be reasons why

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

a group TIN, particularly one that believes it would achieve a higher score than the weighted average APM Entity level score, would prefer to be scored in the improvement activities and advancing care information performance categories at the level of the group billing TIN rather than the ACO (APM Entity level).

We solicited comment as to whether Shared Savings Program ACO eligible clinicians should be scored at the ACO level or the group billing TIN level for the improvement activities and advancing care information performance categories.

The following is a summary of the comments we received regarding our proposals for how to score and weight the improvement activities and advancing care information performance categories for the Shared Savings Program under the APM scoring standard and on whether to score these two MIPS performance categories at the APM Entity or the ACO participant TIN level.

Comment: Several commenters suggested that all APM Entities should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. A few commenters stated that all APM participants should get at least 80 percent of the maximum score for improvement activities. Some commenters suggested that ACOs are involved in many of the improvement activities on a daily basis in order to meet the stringent requirements of the Shared Savings Program and the Next Generation ACO Model and requested that CMS provide a simple and straightforward way for ACOs to attest that their eligible clinicians have been involved in improvement activities for at least 90 days in the performance year by being a part of an ACO initiative.

Response: We agree with the comments that eligible clinicians participating in the Shared Savings Program and other MIPS APMs are actively engaged in improvement activities by virtue of participating in an APM. In an effort to further reduce reporting burden for eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians in MIPS APMs and to better recognize improvement activities work performed through participation in MIPS APMs, we are modifying our proposal with respect to scoring for the improvement activities performance category under the APM scoring standard. Specifically, for APM Entity groups in the Shared Savings Program, Next Generation ACO Model and other MIPS APMs, we will assign a baseline score for the improvement activities performance category based on the improvement activity requirements under the terms of the particular MIPS APM. CMS will review the MIPS APM requirements as they relate to activities specified under the generally applicable MIPS improvement activities performance category and assign an improvement activities score for each MIPS APM that is applicable to all APM Entity groups participating in the MIPS APM. To develop the improvement activities score assigned to a MIPS APM and applicable to all APM Entity groups in the APM, CMS will compare the requirements of the MIPS APM with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned to an APM Entity group in a MIPS APM under the improvement activities performance category will relate to documented requirements under the terms and conditions of the MIPS APM, such as in a participation agreement or regulation. We will apply this improvement activities score for the MIPS APM to each APM Entity group within the MIPS APM. For example, points assigned in the improvement activities performance category for participation in the Next Generation ACO Model will relate to documented requirements under the terms of the model, as set forth in the model's participation agreement. In the event that a MIPS APM incorporates sufficient improvement activities to receive the maximum score, APM Entity groups or their constituent MIPS eligible clinicians (or TINs) participating in the MIPS APM will not need to submit data for the improvement activities

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category in order to receive that maximum improvement activities score. In the event that a MIPS APM does not incorporate sufficient improvement activities to receive the maximum potential score, APM Entities will have the opportunity to report and add points to the baseline MIPS APM-level score on behalf of all MIPS eligible clinicians in the APM Entity group for additional improvement activities that would apply to the APM Entity level improvement activities performance category score. The improvement activities performance category score we assign to the MIPS APM based on improvement activity requirements under the terms of the APM will be published in advance of the MIPS performance period on the CMS website.

Comment: A commenter generally agreed with the proposed reweighting of performance categories for MIPS APMs under the APM scoring standard but recommended the 10 percent for the cost performance category be reallocated to improvement activities instead of both improvement activities and advancing care information. Another commenter also agreed with the scoring and supported the weight for the improvement activities performance category. One commenter recommended that MIPS APM participants have the option of having the APM Entity report improvement activities in order to achieve group scores higher than the initial 50 percent. A few commenters requested that the MIPS APMs only be scored on the quality and improvement activities performance categories.

Response: After considering comments, we believe the reweighting of the improvement activities and the advancing care information performance categories should be finalized as proposed. We believe the proposed weights represent an appropriate balance between improvement activities and advancing care information, both of which are important goals of the MIPS program. Moreover, because the quality performance category weight will be reduced over time we believe that increasing the quality performance category weight in the first performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

period would be incongruent the balance of the weights set forth in the statute.

For the Shared Savings Program we are finalizing the weights assigned to each of the MIPS performance categories as proposed for Shared Savings Program ACOs: quality 50 percent; cost 0 percent; improvement activities 20 percent; and advancing care information 30 percent for purposes of the APM scoring standard. We are finalizing the proposal that for the advancing care information performance category, ACO participant TINs will report the category to MIPS, and the TIN scores will be aggregated and weighted in order to calculate one APM Entity score for the category. In the event a Shared Savings Program ACO fails to satisfy quality reporting requirements for measures reported through the CMS Web Interface, advancing care information group TIN scores will not be aggregated to the APM Entity level. Instead, each ACO participant TIN will be scored separately based on its TIN-level group reporting for the advancing care information performance category.

We are revising our proposal with respect to the scoring of the improvement activities performance category for the Shared Savings Program. We will assign an improvement activities score for the Shared Savings Program based on the improvement activities required under the Shared Savings Program. We consider all Shared Savings Program tracks together for purposes of assigning an improvement activities performance category score because the tracks all require the same activities of their participants. All APM Entity groups in the Shared Savings Program will receive that baseline improvement activities score. To develop the improvement activities score for the Shared Savings Program, we will compare the requirements of the Shared Savings Program with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they would otherwise be scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. We will assign points for improvement activities toward the score for the Shared Savings

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Program based on documented requirements for improvement activities under the terms of the Shared Savings Program. We will publish the assigned scores for Shared Savings Program on the CMS website before the beginning of the MIPS performance period. In the event that the assigned score represents the maximum improvement activities score, APM Entity groups will not need to report additional improvement activities. In the event that the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would apply to the APM Entity group score. Table 11 summarizes the finalized APM scoring standard rules for the Shared Savings Program.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 11: APM scoring standard for the Shared Savings Program – 2017 Performance Period for the 2019 Payment Adjustment**

MIPS Performance Category	APM Entity Submission Requirement	Performance Score	Performance Category Weight
Quality	Shared Savings Program ACOs submit quality measures to the CMS Web Interface on behalf of their participating MIPS eligible clinicians.	The MIPS quality performance category requirements and benchmarks will be used to determine the MIPS quality performance category score at the ACO level.	50%
Cost	MIPS eligible clinicians will not be assessed on cost.	N/A	0%
Improvement Activities	ACOs only need to report if the CMS-assigned improvement activities scores is below the maximum improvement activities score.	CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the Shared Savings Program. The minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, ACOs will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	20%
Advancing Care Information	All ACO participant TINs in the ACO submit under this category according to the MIPS group reporting requirements.	All of the ACO participant TIN scores will be aggregated as a weighted average based on the number of MIPS eligible clinicians in each TIN to yield one APM Entity group score.	30%

(9) Next Generation ACO Model – Quality Performance Category Scoring under the APM Scoring Standard

We proposed that beginning with the first MIPS performance period, Next Generation ACOs would only need to submit their quality measures to CMS once using the CMS Web Interface through the same process that they use to report to the Next Generation ACO Model. These data would be submitted once but used for purposes of both the Next Generation ACO Model and MIPS. Next Generation ACO Model ACOs have used the CMS Web Interface for submitting their quality measures since the model’s inception and would most likely continue to use the CMS Web Interface as the submission method in future years. The Next Generation ACO Model quality measure data reported to the CMS Web Interface would be used by CMS to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

calculate the MIPS APM quality performance score. The MIPS quality performance category requirements and performance benchmarks for reporting quality measures via the CMS Web Interface would be used to determine the MIPS quality performance category score at the ACO level for the APM Entity group. The Next Generation ACO Model quality performance data that are not submitted to the CMS Web Interface, for example the CAHPS survey and claims-based measures, would not be included in the APM Entity group quality performance score. The APM Entity group quality performance category score would be calculated using only quality measure data submitted through the CMS Web Interface and scored using the MIPS benchmarks, whereas the quality reporting requirements and performance benchmarks calculated for the Next Generation ACO Model would continue to be used to assess the ACO under the APM-specific requirements. We stated in the proposed rule that we believe this approach would reduce the reporting burden for Next Generation ACO Model participants by requiring quality measure data to be submitted only once and used for both MIPS and the Next Generation ACO Model.

In the proposed rule, we indicated that we believe that no waivers are necessary here because the quality measures submitted via the CMS Web Interface under the Next Generation ACO Model are MIPS quality measures and would be scored under MIPS performance standards. In the event that Next Generation ACO Model quality measures depart from MIPS measures in the future, we stated that we would address such changes, including whether further waivers are necessary, at such a time in future rulemaking.

The following is a summary of the comments we received regarding our proposal to have Next Generation ACOs report quality measures to MIPS using the CMS Web Interface as they normally would under Next Generation ACO Model rules and our proposal for CMS to calculate the MIPS quality performance category score at the APM Entity group level based on the data reported to the CMS Web Interface and using the MIPS performance standards.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: A commenter requested clarification regarding whether the population-based quality measures and CAHPS would be included in the Next Generation ACO quality performance category score.

Response: The population-based quality measures and CAHPS will not be included in the quality scoring under the APM scoring standard. This final rule with comment period does not affect APM-specific measurement and incentives.

We are finalizing the scoring policy for the quality performance category for the Next Generation ACO Model as proposed. We will use Next Generation ACO Model quality measures submitted by the ACO to the CMS Web Interface and MIPS benchmarks to score quality for MIPS eligible clinicians in a Next Generation ACO at the APM Entity level. An ACO's failure to report quality as required by the Next Generation ACO Model will result in a quality score of zero for the APM Entity group.

#### (10) Next Generation ACO Model – Cost Performance Category Scoring under the APM Scoring Standard

We proposed that for the first MIPS performance period, we would not assess MIPS eligible clinicians in the Next Generation ACO Model participating in the MIPS APM under the cost performance category. We proposed this approach because: (1) MIPS eligible clinicians participating in the Next Generation ACO Model are already subject to cost and utilization performance assessments under the APM; (2) the Next Generation ACO Model measures cost in terms of an objective, absolute total cost of care expenditure benchmark for a population of attributed beneficiaries, and participating ACOs may share savings and/or losses based on that standard, whereas the MIPS cost measures are relative measures such that clinicians are graded relative to their peers and therefore different than assessing total cost of care for a population of attributed beneficiaries; and (3) the beneficiary attribution methodologies for measuring cost

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

under the Next Generation ACO Model and MIPS differ, leading to an unpredictable degree of overlap (for eligible clinicians and for us) between the sets of beneficiaries for which eligible clinicians would be responsible that would vary based on unique APM Entity characteristics such as which and how many eligible clinicians comprise an ACO. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through the Next Generation ACO Model must take priority to ensure that the goals and model evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across the Next Generation ACO Model and MIPS assessments—due to the differences in attribution, the inclusion in MIPS of episode-based measures that do not reflect the total cost of care, and the objective versus relative assessment factors listed above—creates uncertainty for eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of the Next Generation ACO Model. For example, Next Generation ACOs are held accountable for expenditure benchmarks that reflect the total Medicare Parts A and B spending for their attributed beneficiaries, whereas many of the proposed MIPS cost measures focus on spending for particular episodes of care or clinical conditions. Therefore, we proposed to reduce the MIPS cost performance category weight to zero for all MIPS eligible clinicians participating in the Next Generation ACO Model. Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category. With the proposed reduction of the cost performance category weight to zero, we believe it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participating in the Next Generation ACO Model—the requirements under sections

1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such eligible clinicians.

Given the proposal to waive requirements under section 1848(q)(5)(E) of the Act to reduce the weight of the cost performance category to zero, we must subsequently specify how that weight would be redistributed among the remaining performance categories to maintain a total weight of 100 percent. We proposed to redistribute the cost performance category weight to both the improvement activities and advancing care information performance categories as specified in Table 13 of the proposed rule. The MIPS cost performance category is proposed to have a weight of 10 percent. Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories and the weight for this category will be reduced from 50 to 30 percent as of the 2021 payment year, we proposed to evenly redistribute the 10 percent cost weight to the improvement activities and advancing care information performance categories so that the distribution does not change the relative weight of the quality performance category in the opposite of the direction it will change in the future. Because the quality performance category weight is required under the statute to be reduced to 30 percent after the first 2 years of MIPS we believe that increasing the quality performance category weight is incongruous with the eventual balance of the weights set forth in the statute. The redistributed cost performance category weight of 10 percent would result in a 5 percentage point increase (from 15 to 20 percent) for the improvement activities performance category and a 5 percentage point increase (from 25 to 30 percent) for the advancing care information performance category. We invited comments on the proposed redistributed weights and specifically on whether we should also increase the MIPS quality performance category weight.

In the proposed rule, we explained that we understand that as the MIPS cost performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

category evolves over time, there might be greater potential for alignment and less potential duplication or conflict with MIPS cost measurement for MIPS eligible clinicians participating in MIPS APMs such as the Next Generation ACO Model. We stated that we would continue to monitor and consider how we might incorporate an assessment in the MIPS cost performance category into the APM scoring standard for the Next Generation ACO Model. We also understand that reducing the cost weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information performance category scores are higher than the scores MIPS eligible clinicians would have received under the cost performance category, result in higher final scores on average for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO Model. We solicited comment on the possible alternative of assigning a neutral score to APM Entity groups participating in the Next Generation ACO model for the cost performance category in order to moderate APM Entity scores. We also generally sought comment on our proposed policy, and on whether and how we should incorporate the cost performance category into the APM scoring standard for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO model for future years.

The following is a summary of the comments we received regarding our proposal to reduce the MIPS cost performance category weight to zero for APM Entity groups in the Next Generation ACO Model.

Comment: Many commenters supported our proposal to not assess cost for MIPS APMs, including the Next Generation ACO Model.

Response: We appreciate commenters' widespread support for this proposal. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category into the APM scoring standard for participants in the Next Generation ACO Model, we believe that assessment in this category would conflict with Next Generation ACO Model assessment at this time. Participants in the Next Generation ACO Model are assessed through particular attribution and benchmarking methodologies for purposes of earning shared savings payments; adding additional and separate MIPS incentives around cost would be redundant, potentially confusing, and could undermine the incentives built into the Next Generation ACO Model.

We are finalizing our proposal to reduce the cost performance category weight to zero for MIPS eligible clinicians in APM Entity groups participating in the Next Generation ACO Model and to evenly redistribute the 10 percent cost weight to the improvement activities and advancing care information performance categories without changes.

#### (11) Next Generation ACO Model – Improvement Activities and Advancing Care Information Performance Category Scoring under the APM Scoring Standard

We proposed that all MIPS eligible clinicians participating in the Next Generation ACO Model would submit data for the improvement activities and advancing care information performance categories. MIPS eligible clinicians participating in the Next Generation ACO Model may bill through a TIN that includes other MIPS eligible clinicians not participating in the APM. Therefore for both the improvement activities and advancing care information performance categories, we proposed that MIPS eligible clinicians participating in the Next Generation ACO Model would submit individual level data to MIPS and not group level data.

For both the improvement activities and advancing care information performance categories, the scores from all of the individual MIPS eligible clinicians in the APM Entity group would be aggregated to the APM Entity level and averaged for a mean score. Any individual MIPS eligible clinicians that do not report for purposes of the improvement activities

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category or the advancing care information performance category would contribute a score of zero for that performance category in the calculation of the APM Entity score. All MIPS eligible clinicians in the APM Entity group would receive the same APM Entity score.

Because the MIPS quality performance category bears a relatively higher weight than the other three MIPS performance categories, we proposed to evenly redistribute the 10 percent cost performance category weight to the improvement activities and advancing care information performance categories. Section 1848(q)(5)(C)(i) of the Act requires that MIPS eligible clinicians who are in a practice that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, for a performance period shall be given the highest potential score for the improvement activities performance category. Accordingly, a MIPS eligible clinician participating in an APM Entity that meets the definition of a patient-centered medical home or comparable specialty practice will receive the highest potential improvement activities score. Additionally, section 1848(q)(5)(C)(ii) of the Act requires that MIPS eligible clinicians participating in APMs that are not patient-centered medical homes for a performance period shall earn a minimum score of one-half of the highest potential score for improvement activities.

For the APM scoring standard for the first MIPS performance period, we proposed to weight the improvement activities and advancing care information performance categories for the Next Generation ACO Model in the same way that we proposed to weight those categories for the Shared Savings Program: 20 percent and 30 percent for improvement activities and advancing care information, respectively. We solicited comment on our proposals for reporting and scoring the improvement activities and advancing care information performance categories under the APM scoring standard. In particular, we solicited comment on the appropriate weight distributions in the first performance year.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The following is a summary of the comments we received regarding our proposals to score and weight the improvement activities and advancing care information performance categories for APM Entity groups in the Next Generation ACO under the APM scoring standard.

Comment: Several commenters suggested that all APM Entities including ACOs in the Next Generation ACO Model should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. Some commenters also indicated that improvement activities should be reported at the APM Entity level rather than at the individual level then averaged. A few commenters believed that CMS should allow reporting at the APM Entity level for all performance categories. Some commenters also believed that the advancing care information performance category should not be part of the APM scoring standard but rather incorporated into APM design through CEHRT requirements. One commenter indicated that the activities that lead to success in the Next Generation ACO Model directly overlap with the proposed improvement activities.

Response: We agree that we can streamline reporting and scoring for the improvement activities and advancing care information performance categories while recognizing the work Next Generation ACO Model participants do in pursuit of the APM goals. Therefore, as described below, for purposes of the APM scoring standard we will assign an improvement activities score to the Next Generation ACO Model based on the improvement activities required under the Model.

Regarding the advancing care information performance category, we do not believe that there is a compelling reason to exclude assessment in this performance category from the APM scoring standard in the same way that we are reducing the weight of the cost performance category. We do not see advancing care information measurement as duplicative or in conflict with Next Generation ACO Model goals and requirements. Participation in the Next Generation

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

ACO Model is aligned with many MIPS improvement activities measures. This is why we are finalizing a policy that further reduces MIPS reporting burdens for Next Generation ACO Model participants and recognizes the similarities between MIPS improvement activities and the requirements of participating in the Next Generation ACO Model.

Comment: A commenter requested clarification of our proposal that MIPS eligible clinicians participating in the Next Generation ACO would submit data for the improvement activities performance category to MIPS individually, and not as a group.

Response: The proposed policy involved individual reporting of improvement activities, which would be averaged across the ACO for one APM Entity group score. The finalized policy, described below, no longer requires individual reporting for purposes of the improvement activities performance category.

Comment: A commenter noted that Next Generation ACO participants who are determined to be Partial QPs for a year may be disadvantaged given the reweighting of MIPS categories under the APM scoring standard.

Response: We do not believe there is a disadvantage for Partial QPs who achieve that status through participation in any Advanced APM, including the Next Generation ACO Model to the extent it is determined to be an Advanced APM. As discussed in section II.F.5., the eligible clinicians who are Partial QPs can decide at the APM Entity group level to be subject to the MIPS reporting requirements and payment adjustment, in which case the eligible clinicians in the group would be scored under the APM scoring standard, or to be excluded from MIPS for the year.

In response to comments, we are revising our proposal with respect to the scoring of the improvement activities performance category for the Next Generation ACO Model. CMS will assign all APM Entity groups in the Next Generation ACO Model the same improvement

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

activities score based on the improvement activities required by the Next Generation ACO

Model. To develop the improvement activities score assigned to all APM Entity groups in the Next Generation ACO Model, CMS will compare the requirements under the Next Generation ACO Model with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned for participation in the Next Generation ACO Model will relate to documented requirements under the terms of the Next Generation ACO Model. We will publish the assigned improvement activities performance category score for the Next Generation ACO Model, based on the APM's improvement activity requirements, prior to the start of the performance period. In the event that the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would be applied to the baseline APM Entity group score. In the event that the baseline assigned score represents the maximum improvement activities score, APM Entities will not need to report additional improvement activities.

In order to further reduce reporting burden and align with the generally applicable MIPS group reporting option, we are revising the advancing care information scoring policy for the Next Generation ACO Model. A MIPS eligible clinician may receive a score for the advancing care information performance category either through individual reporting or through group reporting based on a TIN according to the generally applicable MIPS reporting and scoring rules for the advancing care information performance category, described in section II.E.5.g of this final rule with comment period. We will attribute one advancing care information score to each MIPS eligible clinician in an APM Entity by looking at both individual and group data submitted for a MIPS eligible clinician and using the highest reported score. Thus, instead of only using

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

individual scores to derive an APM Entity-level advancing care information score as proposed, we will use the highest score attributable to each MIPS eligible clinician in an APM Entity group in order to determine the APM Entity group score based on the average of the highest scores for all MIPS eligible clinicians in the APM Entity group.

Like the proposed policy, each MIPS eligible clinician in the APM Entity group will receive one score, weighted equally with that of the other clinicians in the group, and CMS will calculate a single APM Entity-level advancing care information performance category score.

Also like the proposed policy, for a MIPS eligible clinician who has no advancing care information performance category score—if the individual's TIN did not report as a group and the individual did not report—that MIPS eligible clinician will contribute a score of zero to the aggregate APM Entity group score.

In summary, we will attribute one advancing care information performance category score to each MIPS eligible clinician in an APM Entity group, which will be averaged with the scores of all other MIPS eligible clinicians in the APM Entity group to derive a single APM Entity score. In attributing a score to an individual, we will use the highest score attributable to the TIN/NPI combination of a MIPS eligible clinician. Finally, if there is no group or individual score, we will attribute a zero to the MIPS eligible clinician, which will be included in the aggregate APM Entity score.

We have revised this policy for the advancing care information performance category for Next Generation ACOs under the APM scoring standard because we recognize that individual reporting in the advancing care information performance category for all MIPS eligible clinicians in an APM Entity group may be more burdensome than allowing some degree of group reporting where applicable, and we believe that requiring individual reporting on advancing care information in the Next Generation ACO Model context will not supply a meaningfully greater

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

amount of information regarding the use of EHR technology as prescribed by the advancing care information performance category. We believe that this revised policy maintains the alignment with the generally applicable MIPS reporting and scoring requirements under the advancing care information performance category while responding to commenters' desires for reduced reporting requirements for MIPS APM participants. Therefore, we believe that the revised policy, relative to the proposed policy, has the potential to substantially reduce reporting burden with little to no reduction in our ability to accurately evaluate the adoption and use of EHR technology. We also believe this final policy balances the simplicity of TIN-level group reporting, which can reduce burden, with the flexibility needed to address partial TIN scenarios common among Next Generation ACOs in which a TIN may have some MIPS eligible clinicians participating in the ACO and some MIPS eligible clinicians not in the ACO. Table 12 summarizes the final APM scoring standard rules for the Next Generation ACO Model.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

**TABLE 12: APM scoring standard for the Next Generation ACO Model – 2017  
Performance Period for the 2019 Payment Adjustment**

<b>MIPS Performance Category</b>	<b>APM Entity Submission Requirement</b>	<b>Performance Score</b>	<b>Performance Category Weight</b>
Quality	ACOs submit quality measures to the CMS Web Interface on behalf of their participating MIPS eligible clinicians.	The MIPS quality performance category requirements and benchmarks will be used to determine the MIPS quality performance category score at the ACO level.	50%
Cost	MIPS eligible clinicians will not be assessed on cost.	N/A	0%
Improvement Activities	ACOs only need to report improvement activities data if the CMS-assigned improvement activities score is below the maximum improvement activities score.	CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the Next Generation ACO Model. This minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, ACOs will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	20%
Advancing Care Information	Each MIPS eligible clinician in the APM Entity group reports advancing care information to MIPS through either group reporting at the TIN level or individual reporting.	CMS will attribute one score to each MIPS eligible clinician in the APM Entity group. This score will be the highest score attributable to the TIN/NPI combination of each MIPS eligible clinician, which may be derived from either group or individual reporting. The scores attributed to each MIPS eligible clinician will be averaged to yield a single APM Entity group score.	30%

(12) MIPS APMs Other than the Shared Savings Program and the Next Generation ACO Model – Quality Performance Category Scoring under the APM Scoring Standard

For MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model, we proposed that eligible clinicians or APM Entities would submit APM quality measures under their respective MIPS APM as usual, and those eligible clinicians or APM Entities would not also be required to submit quality information under MIPS for the first performance period. Current MIPS APMs have requirements regarding the number of quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures, measure specifications, as well as the measure reporting method(s) and frequency of reporting, and have an established mechanism for submission of these measures to us. We believe there are operational considerations and constraints that would prevent us from being able to use the quality measure data from some MIPS APMs for the purpose of satisfying the MIPS data submission requirements for the quality performance category in the first performance period. For example, some current APMs use a quality measure data collection system or vehicle that is separate and distinct from the MIPS systems. We do not believe there is sufficient time to adequately implement changes to the current APM quality measure data collection timelines and infrastructure to conduct a smooth hand-off to the MIPS system that would enable use of APM quality measure data to satisfy the MIPS quality performance category requirements in the first MIPS performance period. As we have noted, we are concerned about subjecting MIPS eligible clinicians who participate in MIPS APMs to multiple performance assessments—under MIPS and under the APMs—that are not necessarily aligned and that could potentially undermine the validity of testing or performance evaluation under the APM. As stated in the proposed rule, our goal is to reduce MIPS eligible clinician reporting burden by not requiring APM participants to report quality data twice to us, and to avoid misaligned performance incentives. Therefore, we proposed that, for the first MIPS performance period only, for MIPS eligible clinicians participating in APM Entity groups in MIPS APMs (other than the Shared Savings Program or the Next Generation ACO Model), we would reduce the weight for the quality performance category to zero. As we explained in the proposed rule, we believe it is necessary to do this because we require additional time to make adjustments in systems and processes related to the submission and collection of APM quality measures to align APM quality measures with MIPS and ensure APM quality measure data can be submitted in a time and manner sufficient for use in assessing quality performance under MIPS and under the APM.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Additionally, due to the implementation of a new program that does not account for non-MIPS measures sets, the operational complexity of connecting APM performance to valid MIPS quality performance category scores in the necessary timeframe, as well as the uncertainty of the validity and equity of scoring results could unintentionally undermine the quality performance assessments in MIPS APMs. Finally, for purposes of performing valid evaluations of MIPS APMs, we must reduce the number of confounding factors to the extent feasible, which, in this case, would include reporting and assessment on non-APM quality measures. Thus, we proposed to waive certain requirements of section 1848(q) of the Act for the first MIPS performance year to avoid risking adverse operational or program evaluation consequences for MIPS APMs while we work toward incorporating MIPS APM quality measures into MIPS scoring for future MIPS performance periods.

Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(I) of the Act that specifies the scoring weight for the quality performance category. With the proposed reduction of the quality performance category weight to zero, we believe it would be unnecessary to establish an annual final list of quality measures as required under section 1848(q)(2)(D) of the Act, or to specify and use quality measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirements under sections 1848(q)(2)(D), 1848(q)(2)(B)(i) and 1848(q)(2)(A)(i) of the Act to establish a final list of quality measures (using certain criteria and processes); and to specify and use, respectively, quality measures in calculating the MIPS final score, for these MIPS eligible clinicians.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We anticipated that beginning in the second MIPS performance period, the APM quality measure data submitted to us during the MIPS performance period would be used to derive a MIPS quality performance score for APM Entities in all APMs that meet criteria for application of the APM scoring standard. We also anticipated that it may be necessary to propose policies and waivers of different requirements of the statute—such as one for section 1848(q)(2)(D) of the Act, to enable the use of non-MIPS quality measures in the quality performance category score—through future rulemaking. We indicated that we expect that by the second MIPS performance period we will have had sufficient time to resolve operational constraints related to use of separate quality measure systems and to adjust quality measure data submission timelines. Therefore, beginning with the second MIPS performance period, we anticipated that through use of the waiver authority under section 1115A(d)(1) of the Act, the quality measure data for APM Entities for which the APM scoring standard applies would be used for calculation of a MIPS quality performance score in a manner specified in future rulemaking. We solicited comment on this transitional approach to use of APM quality measures for the MIPS quality performance category for purposes of the APM scoring standard under MIPS in future years.

The following is a summary of the comments we received regarding our proposal to, for the first MIPS performance period, reweight the quality performance category to zero for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model.

Comment: A commenter supported exempting MIPS APMs that are not using the CMS Web Interface to report quality from reporting for purposes of the MIPS quality performance category in the first performance year. One commenter was concerned that these MIPS APMs will not receive a quality score for the first performance year and another commenter recommended revising the performance category weights so that quality is included.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We agree that it would be ideal to include performance on quality for all MIPS APMs in the first MIPS performance year. As noted, we are only reweighting the quality performance category to zero for the first performance year due to operational limitations. APM Entities in MIPS APMs are, under the policies adopted in this final rule with comment period, required to base payment incentives on cost/utilization and quality measure performance. As such they will continue to report quality as required under the APM, and are not truly exempt from quality assessment for the year. We are finalizing the inclusion of a MIPS quality performance category score under the APM scoring standard for the 2018 performance year at §414.1370(f), and will develop additional scoring policies for that year through future notice-and-comment rulemaking.

We are finalizing as proposed the policy to reweight the MIPS quality performance category to zero percent for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model for the first performance year.

#### (13) MIPS APMs Other than the Shared Savings Program and Next Generation ACO – Cost Performance Category Scoring under the APM Scoring Standard

For the first MIPS performance period, we proposed that, for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model, to reduce the weight of the cost performance category to zero. We proposed this approach because: (1) APM Entity groups are already subject to cost and utilization performance assessments under MIPS APMs; (2) MIPS APMs usually measure cost in terms of total cost of care, which is a broader accountability standard that inherently encompasses the purpose of the claims-based measures that have relatively narrow clinical scopes, and MIPS APMs that do not measure cost in terms of total cost of care may depart entirely from MIPS measures; and (3) the beneficiary attribution methodologies differ for measuring cost under APMs and MIPS, leading

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to an unpredictable degree of overlap (for eligible clinicians and for CMS) between the sets of beneficiaries for which eligible clinicians would be responsible that would vary based on unique APM Entity characteristics such as which and how many eligible clinicians comprise an APM Entity. We believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population, the population identified through an APM must take priority to ensure that the goals and model evaluation associated with the APM are as clear and free of confounding factors as possible. The potential for different, conflicting results across APM and MIPS assessments creates uncertainty for MIPS eligible clinicians who are attempting to strategically transform their respective practices and succeed under the terms of an APM. Accordingly, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirement under section 1848(q)(5)(E)(i)(II) of the Act that specifies the scoring weight for the cost performance category.

With the proposed reduction of the cost performance category weight to zero, we believed it would be unnecessary to specify and use cost measures in determining the MIPS final score for these MIPS eligible clinicians. Therefore, under section 1115A(d)(1) of the Act, we proposed to waive—for MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model—the requirements under section 1848(q)(2)(B)(ii) and 1848(q)(2)(A)(ii) of the Act to specify and use, respectively, cost measures in calculating the MIPS final score for such eligible clinicians.

Given the proposal to waive requirements of section 1848(q) of the Act to reduce the weight of the quality and cost performance categories to zero, we also needed to specify how those weights would be redistributed among the remaining improvement activities and advancing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

care information categories in order to maintain a total weight of 100 percent. We proposed to redistribute the quality and the cost performance category weights as specified in Table 14 of the proposed rule.

We understand that as the cost performance category evolves, the rationale we discussed in the proposed rule for establishing a weight of zero for this performance category might not be applicable in future years. We solicited comment on whether and how we should incorporate the cost performance category into the APM scoring standard under MIPS. We also understand that reducing the quality and cost performance category weight to zero and redistributing the weight to the improvement activities and advancing care information performance categories could, to the extent that improvement activities and advancing care information scores are higher than the scores MIPS eligible clinicians would have received under the cost performance category, would result in higher final scores on average for MIPS eligible clinicians in APM Entity groups participating in MIPS APMs. We solicited comment on the possible alternative of assigning a neutral score to MIPS eligible clinicians in APM Entity groups participating in MIPS APMs for the quality and cost performance categories in order to moderate APM Entity scores.

The following is a summary of the comments we received regarding our proposal to establish a MIPS cost performance category weight of zero for all MIPS eligible clinicians in APM Entities participating in the MIPS APMs other than the Shared Savings Program and the Next Generation ACO model.

Comment: The majority of commenters supported not assessing cost for MIPS APMs by reducing the weight for the cost performance category to zero.

Response: We appreciate commenters' widespread support for this proposal. While we will continue to monitor and consider how we might in future years incorporate the MIPS cost performance category into the APM scoring standard for all MIPS APMs, we believe that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

inclusion of this category would conflict with the assessment of cost made within MIPS APMs at this time. Participants in MIPS APMs are assessed through particular attribution and benchmarking methodologies for purposes of incentives and penalties; adding additional and separate MIPS incentives around cost would be redundant, potentially confusing, and could undermine the incentives built into these MIPS APMs.

We are finalizing the proposal to reduce the cost performance category weight to zero percent for APM Entity groups in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model.

(14) MIPS APMs Other than the Shared Savings Program and Next Generation ACO Model – Improvement Activities and Advancing Care Information Performance Category Scoring under the APM Scoring Standard

We proposed that all MIPS eligible clinicians participating in a MIPS APM other than the Shared Savings Program or the Next Generation ACO Model would submit data for the improvement activities and advancing care information performance categories as individual MIPS eligible clinicians. MIPS eligible clinicians in these other APMs may bill through a TIN that includes MIPS eligible clinicians that do not participate in the APM. Therefore for both the improvement activities and the advancing care information performance categories, we proposed that these MIPS eligible clinicians submit individual level data to MIPS and not group level data. For both the improvement activities and advancing care information performance categories, the scores from all of the individual MIPS eligible clinicians in the APM Entity group would be aggregated to the APM Entity level and averaged for a mean score. Any individual MIPS eligible clinicians that do not submit data for the improvement activities performance category or the advancing care information performance category would contribute a score of zero for that performance category in the calculation of the APM Entity score. All MIPS eligible clinicians in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the APM Entity group would receive the same APM Entity group score.

Section 1848(q)(5)(C)(i) of the Act requires that MIPS eligible clinicians who are in a practice that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, for a performance period shall be given the highest potential score for the improvement activities performance category. Accordingly, a MIPS eligible clinician in an APM Entity group that meets the definition of a patient-centered medical home or comparable specialty practice will receive the highest potential score. Additionally, section 1848(q)(5)(C)(ii) of the Act requires that MIPS eligible clinicians participating in APMs that are not patient-centered medical homes for a performance period shall earn a minimum score of one-half of the highest potential score for improvement activities. We acknowledged that using this increased weight for improvement activities may make it easier in the first performance period for eligible clinicians in a MIPS APM to attain a higher MIPS score. We do not have historical data to assess the range of scores under improvement activities because this is the first time such activities are being assessed in such a manner.

For the advancing care information performance category, we explained our belief that MIPS eligible clinicians participating in MIPS APMs would be using certified health IT and other health information technology to coordinate care and deliver better care to their patients. Most MIPS APMs encourage participants to use health IT to perform population management, monitor their own quality improvement activities and, better coordinate care for their patients in a way that aligns with the goals of the advancing care information performance category. In the proposed rule, we indicated that we want to ensure that where we proposed reductions in weights for other MIPS performance categories, such weights are appropriately redistributed to the advancing care information performance category.

Therefore, for the first MIPS performance period, we proposed that the weights for the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

improvement activities and advancing care information performance categories would be 25 percent and 75 percent, respectively. We solicited comment on our proposals for reporting and scoring the improvement activities and advancing care information performance categories under the APM scoring standard. In particular, we solicited comment on the appropriate weight distributions in the first performance year and subsequent years when we anticipate incorporating assessment in the quality performance category for all MIPS eligible clinicians participating in MIPS APMs.

The following is a summary of the comments we received regarding our proposals to score and weight the improvement activities and advancing care information performance categories for MIPS eligible clinicians participating in APM Entity groups in MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model under the APM scoring standard.

Comment: Some commenters were concerned that if eligible clinicians in MIPS APMs would be scored only on the advancing care information and improvement activities performance categories, clinicians in those MIPS APMs could disproportionately receive upward MIPS payment adjustments because they would not be assessed in the quality or cost performance categories. Commenters believed that it may be easier for clinicians to perform well in the improvement activities and advancing care information performance categories than in the quality and cost performance categories. Although a few commenters supported the proposed performance category weights, other commenters suggested alternatives. Two commenters were concerned about the performance category scoring weights for MIPS APMs under the APM scoring standard and suggested that the weights for the advancing care information and improvement activities performance categories should be similar to the ones proposed for the Shared Savings Program and Next Generation ACO Model. Two other commenters suggested

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assigning greater weight to the improvement activities performance category instead of redistributing so much of the weight to the advancing care information performance category. A few commenters suggested redistributing the weights from the quality and cost performance categories to the improvement activities and advancing care information performance categories differently—for example, 50 percent for improvement activities and 50 percent for advancing care information. One commenter indicated they understood the need to reweight the improvement activities and advancing care information for MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model but requested that, in making reweighting decisions, CMS give consideration to ensuring a “level playing field.” A few commenters expressed concern that the proposed APM scoring standard for MIPS APMs increases the advancing care information category weight to 75 percent, and a commenter stated that performance in this category could be challenging for many clinicians, particularly those with little control over the IT choices and decisions made by their employers. A commenter recommended basing performance in this category on the adoption and use of EHR technology tailored to a specialty-appropriate assessment of meaningful use and urged CMS to work closely with physician societies.

Response: We understand that an APM Entity group’s final score under the proposed weights for the APM scoring standard could differ from the final score such APM Entity groups could receive if they were subject to both the quality and cost performance categories. However, for reasons discussed above, reweighting the quality performance category to zero percent is necessary for operational and programmatic reasons only for the first performance year, and we anticipate being able to incorporate performance under MIPS APM quality measures beginning in the second year of the Quality Payment Program, subject to future rulemaking. Also, in light of the MIPS scoring policies we are finalizing for the first performance year, we do not believe

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that this will cause a material adverse impact on MIPS scoring because the impact on MIPS payment adjustments for an eligible clinician will be affected more by meeting the minimum reporting requirements than by the weighting of performance categories. . In subsequent years, we intend to incorporate assessments in the quality performance category into the APM scoring standard for all MIPS APMs, and the performance category weights will no longer so heavily emphasize advancing care information. For the first performance year, we believe that the proposed balance between improvement activities and advancing care information is appropriate, especially given the possibility that MIPS APM participants may be assigned the maximum improvement activities score under our final policy, as described below.

Comment: A commenter stated that improvement activities reporting should be done by the APM Entity and that advancing care information should not be part of the APM scoring standard. Several commenters suggested that all APM Entities should receive full credit for improvement activities because they are already performing these activities as a result of being a participant in an APM. Other commenters suggested that both advancing care information and improvement activities be reported and scored at the individual level instead of being aggregated to the APM Entity level. A few commenters believed that CMS should allow reporting at the APM Entity level for all performance categories.

Response: In contrast to the cost performance category, we do not find a compelling reason to reduce the weight of the advancing care information performance category because we do not believe it would potentially conflict with or duplicate assessments that are made within the MIPS APM.

We agree with commenters that reporting in the improvement activities performance category could be more efficient if done by an APM Entity on behalf of the APM Entity group. In order to further reduce reporting burden on all parties and to better recognize improvement

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

activities work performed through participation in MIPS APMs, we are modifying our proposal with respect to scoring for the improvement activities performance category under the MIPS APM scoring standard. As described above, we will assign an improvement activities performance category score at the MIPS APM level based on the requirements of participating in the particular MIPS APM. The baseline score will be applied to each APM Entity group in the MIPS APM. In the event that the assigned score is less than the maximum score, we would allow the APM Entity to report additional activities to add points to the APM Entity group score. With regards to the comment suggesting scoring improvement activities at the individual level, we believe that reporting and scoring improvement activities at the APM Entity level support the goals of APM participation, which focus on collective responsibility for the cost and quality of care for beneficiaries. Similarly, we agree with the comments pointing out that eligible clinicians participating in MIPS APMs are actively engaged in improvement activities by virtue of participating in the APM.

Comment: A commenter sought clarification regarding how a subgroup of MIPS eligible clinicians that is not participating in a MIPS APM will be treated when other MIPS eligible clinicians in the same large multispecialty practice participate in a MIPS APM.

Response: We maintain lists of participants that are in the MIPS APM using the APM participant identifier, and those MIPS eligible clinicians will be scored as an APM Entity group under the APM scoring standard. The non-APM participants in the practice will report to MIPS under the generally applicable MIPS requirements for reporting as an individual or group. If the practice decides to report to MIPS as a group under its TIN, then its reporting may include some data from the MIPS APM participants, even though those TIN/NPI combinations will receive their MIPS final score based on the APM Entity group according to the scoring hierarchy in section II.E.6. of this final rule with comment period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are revising the proposed improvement activities scoring policy for MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model. CMS will assign a score for the improvement activities performance category to each MIPS APM, and that score will be applied to each APM Entity group in the MIPS APM. To develop the improvement activities score for a MIPS APM, CMS will compare the requirements of the MIPS APM with the list of improvement activities measures in section II.E.5.f. of this final rule with comment period and score those measures in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.5.f. of this final rule with comment period. Thus, points assigned to an APM Entity group in a MIPS APM under the improvement activities performance category will relate to documented requirements under the terms and conditions of the MIPS APM. We will publish the assigned improvement activities scores for each MIPS APM on the CMS website prior to the beginning of the MIPS performance period. In the event that the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities that would apply to the APM Entity group score. In the event that the assigned score represents the maximum improvement activities score, APM Entity groups will not need to report additional improvement activities.

In order to further reduce reporting burden and align with the generally applicable MIPS group reporting option, we are also revising the proposed advancing care information scoring policy for MIPS APMs other than the Shared Savings Program and the Next Generation ACO Model.

A MIPS eligible clinician may receive a score for the advancing care information performance category either through individual reporting or through group reporting based on a TIN according to the generally applicable MIPS reporting and scoring rules for the advancing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

care information performance category, described in section II.E.5.g. of this final rule with comment period. We will attribute one score to each MIPS eligible clinician in an APM Entity group by looking for both individual and group data submitted for a MIPS eligible clinician and using the highest score. Thus, instead of only using individual scores to derive an APM Entity-level advancing care information score as proposed, we will use the highest score attributable to each MIPS eligible clinician in an APM Entity group in order to create the APM Entity group score based on the average of the highest scores for all MIPS eligible clinicians in the APM Entity group.

Like the proposed policy, each MIPS eligible clinician in the APM Entity group will receive one score, weighted equally with that of the other clinicians in the group, and we will calculate a single APM Entity-level advancing care information score. Also like the proposed policy, for a MIPS eligible clinician who has no advancing care information score attributable to the individual—the individual's TIN did not report as a group and the individual did not report—that MIPS eligible clinician will contribute a score of zero to the aggregate APM Entity group score.

In summary, we will attribute one advancing care information score to each MIPS eligible clinician in an APM Entity group, which will be averaged with the scores of all other MIPS eligible clinicians in the APM Entity group to derive a single APM Entity score. In attributing a score to an individual, we will use the highest score attributable to the TIN/NPI combination of a MIPS eligible clinician. Finally, if there is no group or individual score, we will attribute a zero to the MIPS eligible clinician, which will be included in the aggregate APM Entity score.

We have revised the proposed policy for the advancing care information performance category for MIPS APM participants under the APM scoring standard because we recognize that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

individual reporting in the advancing care information performance category for all MIPS eligible clinicians in an APM Entity group may be more burdensome than allowing some degree of group reporting where applicable, and we believe that requiring individual reporting on advancing care information in the MIPS APM context will not supply a meaningfully greater amount of information regarding the use of EHR technology as prescribed by the advancing care information performance category. We believe that this revised policy maintains the alignment with the generally applicable MIPS reporting and scoring requirements under the advancing care information performance category while responding to commenters' desires for reduced reporting requirements for MIPS APM participants. Therefore, we believe that the revised policy, relative to the proposed policy, has the potential to substantially reduce reporting burden with little to no reduction in our ability to accurately evaluate the adoption and use of EHR technology. We also believe this final policy balances the simplicity of TIN-level group reporting, which can reduce burden, with the flexibility needed to address partial TIN scenarios common among APM Entities in MIPS APMs in which a TIN may have some MIPS eligible clinicians participating in the APM Entity and some MIPS eligible clinicians not in the APM Entity. Table 13 summarizes the finalized APM scoring standard rules for MIPS APMs other than the Shared Savings Program and Next Generation ACO Model.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 13: APMs scoring standard for MIPS APMs other than the Shared Savings Program and Next Generation ACO Model – 2017 Performance Period for the 2019 Payment Adjustment**

<b>MIPS Performance Category</b>	<b>APM Entity Submission Requirement</b>	<b>Performance Score</b>	<b>Performance Category Weight</b>
Quality	The APM Entity group will not be assessed on quality under MIPS in the first performance period. The APM Entity will submit quality measures to CMS as required by the APM.	N/A	0%
Cost	MIPS eligible clinicians will not be assessed on cost.	N/A	0%
Improvement Activities	APM Entities only need to report improvement activities data if the CMS-assigned improvement activities scores is below the maximum improvement activities score.	CMS will assign the same improvement activities score to each APM Entity group based on the activities required of participants in the MIPS APM. The minimum score is one half of the total possible points. If the assigned score does not represent the maximum improvement activities score, APM Entities will have the opportunity to report additional improvement activities to add points to the APM Entity group score.	25%
Advancing Care Information	Each MIPS eligible clinician in the APM Entity group reports advancing care information to MIPS through either group reporting at the TIN level or individual reporting.	CMS will attribute one score to each MIPS eligible clinician in the APM Entity group. This score will be the highest score attributable to the TIN/NPI combination of each MIPS eligible clinician, which may be derived from either group or individual reporting. The scores attributed to each MIPS eligible clinician will be averaged to yield a single APM Entity group score.	75%

(15) APM Entity Data Submission Method

Presently, we require APM Entities in MIPS APMs to either use the CMS Web Interface or another data submission mechanism for submitting data on the quality measures for purposes of the APM. We are not currently proposing to change the method used by APM Entities to submit their quality measure data to CMS. Therefore, we expect that APM Entities like the Shared Savings Program ACOs will continue to submit their data on quality measures using the CMS Web Interface data submission mechanism. Similarly, in the event that the Comprehensive

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

ESRD Care (CEC) Initiative is determined to be a MIPS APM, APM Entities in the CEC would continue to submit their quality measures to CMS using the Quality Measures Assessment Tool (QMAT) for purposes of the CEC quality performance assessment under the APM. We proposed that all MIPS eligible clinicians in APM Entities participating in MIPS APMs would be required to use one of the proposed MIPS data submission mechanisms to submit data for the advancing care information performance category.

The following is a summary of the comments we received regarding the method used by APM Entities to submit quality data for purposes of MIPS.

Comment: One commenter requested that all APM Entities be required to use the QRDA III data submission method because many EHRs now support this standard. Another commenter supported retaining the CMS Web Interface as the submission method for quality data for APM Entities participating in the Shared Savings Program. One commenter suggested that the improvement activities information could be collected via the CMS Web Interface. Another commenter suggested that all MIPS performance categories be submitted via web-based reporting. Some commenters communicated that MIPS eligible clinicians participating in APMs should not have to report quality data separately to both APMs and MIPS and another commenter suggested that MIPS APM participants only be required to submit data for the quality and improvement activities performance categories.

Response: We appreciate the commenter's support and suggestions. We believe the policies that we are adopting in this final rule regarding data submission minimize reporting burden and disruption to APM participants and we will continue to consider new reporting methods in the future.

Comment: A commenter recommended that the data collection processes be standardized and data submission be minimized to the extent that data can be used for various

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

purposes within the Medicare program because rural practices often have human and IT infrastructure resource limitations.

Response: We thank the commenters for their input and believe that the finalized policies for the APM scoring standard represent further reductions in reporting burden and reflect our commitment to streamline submissions wherever possible. We will continue to look for ways to reduce reporting burdens without compromising the robustness of our assessments.

We are finalizing without changes our proposal regarding APM Entity data submission for the quality performance category in all MIPS APMs and the advancing care information performance category in the Shared Savings Program. APM Entity groups will not submit data for the improvement activities performance category unless the improvement activities performance category score we assign at the MIPS APM level is less than the maximum score. In this instance, the APM Entities in the MIPS APM would use one of the MIPS data submission mechanisms if they opt to report additional improvement activities in order to increase their score for the improvement activities performance category. MIPS eligible clinicians in APM Entity groups participating in MIPS APMs other than the Shared Savings Program may report advancing care information performance category to MIPS using a MIPS data submission mechanism for either group reporting at the TIN level or individual reporting. Table 14 describes data submission methods for the MIPS performance categories under the APM scoring standard.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 14: APM Entity Submission Method for Each MIPS Performance Category**

<b>MIPS Performance Category</b>	<b>APM Entity Eligible Clinician Submission Method</b>
Quality	The APM Entity group submits quality measure data to CMS as required under the APM.
Cost	No data submitted by APM Entity group to MIPS.
Improvement Activities	No data submitted by APM Entity group to MIPS unless the assigned score at the MIPS APM level does not represent the maximum improvement activities score, in which case the APM Entity may report additional improvement activities using a MIPS data submission mechanism.
Advancing Care Information	Shared Savings Program ACO participant TINs submit data using a MIPS data submission mechanism. Next Generation ACO Model and other MIPS APM eligible clinicians submit data at either the individual level or at the TIN level using a MIPS data submission mechanism.

(16) MIPS APM Performance Feedback

For the first MIPS performance feedback specified under section 1848(q)(12) of the Act to be published by July 1, 2017, we proposed that all MIPS eligible clinicians participating in MIPS APMs would receive the same historical information prepared for all MIPS eligible clinicians except the report would indicate that the historical information provided to such MIPS eligible clinicians is for informational purposes only. MIPS eligible clinicians participating in APMs have been evaluated for performance only under the APM. Thus, historical information may not be representative of the scores that these MIPS eligible clinicians would receive under MIPS.

For MIPS eligible clinicians participating in MIPS APMs, we proposed that the MIPS performance feedback would consist only of the scores applicable to the APM Entity group for the specific MIPS performance period. For example, the MIPS eligible clinicians participating in the Shared Savings Program and Next Generation ACO Model would receive performance feedback for the quality, improvement activities, and advancing care information performance categories for the 2017 performance period. Because these MIPS eligible clinicians would not be assessed for the cost performance category, information on MIPS performance scores for the cost

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category would not be applicable to these MIPS eligible clinicians.

We also proposed that, for the Shared Savings Program, the performance feedback would be available to the eligible clinicians participating in the Shared Savings Program at the group billing TIN level. For the Next Generation ACO Model we proposed that the performance feedback would be available to all MIPS eligible clinicians participating in the MIPS APM Entity.

We proposed that in the first MIPS performance period, the MIPS eligible clinicians participating in MIPS APMs other than the Shared Savings Program or the Next Generation ACO Model would receive performance feedback for the improvement activities and advancing care information performance categories only, as they would not be assessed under the quality or cost performance categories. The information such as MIPS measure score comparisons for the quality and cost performance categories would not be applicable to these MIPS eligible clinicians because no such comparative data would exist. We proposed the performance feedback for MIPS eligible clinicians participating in these other APMs would be available for each MIPS eligible clinician that submitted MIPS data for these performance categories under their respective APM Entities. We invited comment on these proposals.

The following is a summary of the comments we received regarding our proposals to provide the same historical information as those participating in MIPS, provide feedback on scores for applicable performance categories to the APM Entity group for the specific MIPS performance period, and provide feedback for those participating in the Shared Savings Program at the group TIN level and feedback for those participating in the Next Generation ACO Model and all other MIPS APMs at the individual level.

Comment: One commenter recommended that CMS deliver feedback to clinicians or organizations by no later than October 1 of the reporting year to allow the organization to make

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

appropriate changes in care improvement. One commenter stated that eligible clinicians participating in APMs need timely feedback to provide a clear understanding of patient attribution and performance measurement, and several commenters requested that CMS give feedback more frequently than annually during the first few years of the program.

Response: We appreciate that MIPS eligible clinicians participating in MIPS APMs would prefer to receive feedback as early and often as possible in order to succeed in the Quality Payment Program and continue to improve, and we will continue to explore opportunities to provide more frequent feedback in the future.

We are revising the proposed policy in order to maintain alignment with the generally applicable MIPS performance feedback policies. As noted in section II.E.8.a. of this final rule with comment period, the September 2016 QRUR will be used to satisfy the requirement under section 1848(q)(12)(A)(i) of the Act to provide MIPS eligible clinicians performance feedback on the quality and cost performance categories beginning July 1, 2017. We are finalizing a policy that all MIPS eligible clinicians scored under the APM scoring standard will also receive this performance feedback to the extent applicable, unless they did not have data included in the September 2016 QRUR. MIPS eligible clinicians without data included in the September 2016 QRUR will not receive performance feedback until CMS is able to use data acquired through the Quality Payment Program for performance feedback.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

## 6. MIPS Final Score Methodology

By incentivizing quality and value for all MIPS eligible clinicians, MIPS creates a new mechanism for calculating MIPS eligible clinician payments. To implement this vision, we proposed a scoring methodology that allows for accountability and alignment across the performance categories and minimizes burden on MIPS eligible clinicians. Further, we proposed a scoring methodology that is meaningful, understandable and flexible for all MIPS eligible clinicians. Our proposed methodology would allow for multiple pathways to success with flexibility for the variety of practice types and reporting options. First, we proposed multiple ways that MIPS eligible clinicians may submit data to MIPS for the quality performance category. Second, we provided greater flexibility in the reporting requirements and scoring for MIPS. Third, we proposed that bonus points would be available for reporting high priority measures and electronic reporting of quality data. Recognizing that MIPS is a new program, we also outlined proposals which we believed are operationally feasible for us to implement in the transition year, while maintaining our longer-term vision.

Section 1848(q) of the Act requires the Secretary to: (1) Develop a methodology for assessing the total performance of each MIPS eligible clinician according to performance standards for a performance period for a year; (2) using the methodology, provide a final score for each MIPS eligible clinician for each performance period; and (3) use the final score of the MIPS eligible clinician for a performance period to determine and apply a MIPS payment adjustment factor (and, as applicable, an additional MIPS payment adjustment factor) to the MIPS eligible clinician for the MIPS payment year. In section II.E.5 of the proposed rule (81 FR 28181), we proposed the measures and activities for each of the four MIPS performance categories: quality, cost, improvement activities, and advancing care information. This section of the final rule with comment period discusses our proposals of the performance standards for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the measures and activities for each of the four performance categories under section 1848(q)(3) of the Act, the methodology for determining a score for each of the four performance categories (referred to as a “performance category score”), and the methodology for determining a final score under section 1848(q)(5) of the Act based on the scores determined for each of the four performance categories. We proposed to define the performance category score in section II.E.6 of the proposed rule (81 FR 28247) as the assessment of each MIPS eligible clinician’s performance on the applicable measures and activities for a performance category for a performance period based on the performance standards for those measures and activities. In section II.E.7 of the proposed rule (81 FR 28271), we included proposals for determining the MIPS adjustments factors based on the final score.

As noted in section II.E.2 of the proposed rule (81 FR 28176), we proposed to use multiple identifiers to allow MIPS eligible clinicians to be measured as individuals, or collectively as part of a group or an APM Entity group (an APM Entity participating in a MIPS APM). Further, in section II.E.5.a.(2) of the proposed rule (81 FR 28182), we proposed that data for all four MIPS performance categories would be submitted using the same identifier (either individual or group) and that the final score would be calculated using the same identifier. Section II.E.5.h of the final rule with comment period describes our policies in the event that an APM Entity scored through the APM scoring standard fails reporting. The scoring proposals in section II.E.6 of the proposed rule (81 FR 28247), would be applied in the same manner for either individual submissions, proposed as TIN/NPI, or for the group submissions using the TIN identifier. Unless otherwise noted, for purposes of this section on scoring, the term “MIPS eligible clinician” will refer to clinicians that are reporting and are scored at either the individual or group level, but will not refer to clinicians participating in an APM Entity scored through the APM scoring standard.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comments related to APM Entity group reporting and scoring for MIPS eligible clinicians participating in MIPS APMs are summarized in section II.E.5.h of this final rule with comment period. All eligible clinicians that participate in APMs are considered MIPS eligible clinicians unless and until they are determined to be either QPs or Partial QPs who elect not to report under MIPS, and are excluded from MIPS, or unless another MIPS exclusion applies. We finalize at §414.1380(d) that MIPS eligible clinicians in APM Entities that are subject to the APM scoring standard are scored using the methodology under §414.1370, as described in II.E.5.h of this final rule with comment period.

MIPS eligible clinicians who participate in APMs that are not MIPS APMs as defined in section II.E.5.h of the proposed rule (81 FR 28234) would report to MIPS as an individual MIPS eligible clinician or group. Unless otherwise specified, the proposals in section II.E.6.a of the proposed rule (81 FR 28247) that relate to reporting and scoring of measures and activities do not affect the APM scoring standard.

Our rationale for our scoring methodology is grounded in the understanding that the MIPS scoring system has many components and numerous moving parts. Thus, we believe it is necessary to set up key parameters around scoring, including requiring MIPS eligible clinicians to report at the individual or group level across all performance categories and generally, to submit information for a performance category using a single submission mechanism. Too many different permutations would create additional complexities that could create confusion amongst MIPS eligible clinicians as to what is or is not allowed.

We have heard from stakeholders about our MIPS proposals. There are some major concerns, particularly for the transition year (MIPS payment year 2019), about program complexity, not having sufficient time to understand the program before being measured, and potentially receiving negative adjustments. Based on stakeholder feedback discussed in this

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

section, we are adjusting multiple parts of our proposed scoring approach to enhance the likelihood MIPS eligible clinicians who may have not had time to prepare can succeed under the program. We believe that these adjustments will enable more robust and thorough engagement with the program over time. Specifically, we have modified performance standards for the performance categories used to evaluate the measures and activities as well as the methodology to create a final score, and we lowered the performance threshold. Thus, we have created a transition year scoring methodology that does the following:

- Provides a negative 4 percent payment adjustment to MIPS eligible clinicians who do not submit any data to MIPS;
- Ensures that MIPS eligible clinicians who submit data and meet program requirements under any of the three performance categories for which data must be submitted (quality, improvement activities, and advancing care information) for at least a 90-day period<sup>20</sup>, and have low overall performance in the performance category or categories on which they choose to report may receive a final score at or slightly above the performance threshold and thus a neutral to small positive adjustment, and
- Ensures that MIPS eligible clinicians who submit data and meet program requirements under each of the three performance categories for which data must be submitted (quality, improvement activities, and advancing care information) for at least a 90-day period, and have average to high overall performance across the three categories may receive a final score above the performance threshold and thus a higher positive adjustment, and, for those MIPS eligible

---

<sup>20</sup> We note there are special circumstances in which MIPS eligible clinicians may submit data for a period of less than 90 days and avoid a negative MIPS payment adjustment. For example, in some circumstances, MIPS eligible clinicians may meet data completeness criteria for certain quality measures in less than the 90-day period. Also, in instances where MIPS eligible clinicians do not meet the data completeness criteria for quality measures submitted, we will provide partial credit for submission of these measures.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians who receive a final score at or above the additional performance threshold, an additional positive adjustment.

a. Converting Measures and Activities into Performance Category Scores

(1) Policies that Apply across Multiple Performance Categories

The detailed policies for scoring the four performance categories are described in section II.E.6.a of the proposed rule (81 FR 28248). However, as the four performance categories collectively create a single MIPS final score, there are some cross-cutting policies that we proposed to apply to multiple performance categories.

(a) Performance Standards

Section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities in the four MIPS performance categories. Section 1848(q)(3)(B) of the Act requires the Secretary, in establishing performance standards for measures and activities for the four MIPS performance categories, to consider historical performance standards, improvement, and the opportunity for continued improvement. We proposed to define the term, performance standards, at §414.1305 as the level of performance and methodology that the MIPS eligible clinician is assessed on for a MIPS performance period at the measures and activities level for all MIPS performance categories. We defined the term, MIPS payment year, at §414.1305 as the calendar year in which MIPS payment adjustments are applied. Performance standards for each performance category were proposed in more detail in section II.E.6 of the proposed rule (81 FR 28247). MIPS eligible clinicians would know the actual performance standards in advance of the performance period, when possible. Further, each performance category is unified under the principle that MIPS eligible clinicians would know, in advance of the performance period, the methodology for determining the performance standards and the methodology that would be used to score their performance. Table 16 of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

proposed rule (81 FR 28249), summarizes the proposed performance standards.

The following is a summary of the comments we received regarding our performance standard proposals.

Comment: Multiple commenters were concerned that the performance standards may not be available in advance of the performance period, or that the performance standards methodologies would only be available “when possible”. Commenters requested that CMS publish the performance standards with as much advance notice as possible so that MIPS eligible clinicians will be able to plan and know the standards against which they will be measured.

Response: The performance standard methodology will be known in advance so that MIPS eligible clinicians can understand how they will be measured. For improvement activities and advancing care information, the performance standards are known prior to the performance period and are delineated in this final rule with comment period. For the quality performance category, benchmarks are known prior to the performance period when benchmarks are based on the baseline period. For new measures in the quality performance category, for quality measures where there is no historical baseline data to build the benchmarks, and for measures in the cost performance category, the benchmarks will be based on performance period data and therefore, will not be known prior to the performance period.

When performance standards for certain quality measures are not known prior to the performance period, we are implementing protections for MIPS eligible clinicians who ultimately perform poorly on these measures. For example, as discussed in section II.E.6.a.(2)(b) of this final rule with comment period, we have added quality performance floors for the transition year to protect MIPS eligible clinicians against unexpectedly low performance scores. For cost measures, the benchmarks will be based on performance period data and cannot be published in advance. However, we do plan to provide feedback on performance so that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinicians can understand their performance and improve in subsequent years. We will provide feedback before the performance period based on prior period data, illustrating how MIPS eligible clinicians might perform on these measures and we will provide feedback after the performance period based on performance period data, illustrating how MIPS eligible clinicians actually performed on these measures.

In addition, as discussed in section II.E.5.e.(2) of this final rule with comment period, we are also lowering the weight of the cost performance category to 0 percent of the final score for the transition year.

Finally, as discussed in section II.E.7.c of this final rule with comment period, we are lowering the performance threshold for this transition year.

Comment: One commenter stated that the government should not decide on definitions of quality and financial rewards or penalties for meeting such standards.

Response: Section 1848(q)(3)(A) of the Act requires the Secretary to establish performance standards for the measures and activities in the four MIPS performance categories, including quality, and section 1848(q)(1)(A) of the Act generally requires us to develop a scoring methodology for assessing the total performance of each MIPS eligible clinician according to those standards and to use such scores to determine and apply MIPS payment adjustment factors and, as applicable, additional MIPS adjustments. We believe our proposals are consistent with these statutory requirements.

After consideration of the comments, we are finalizing the term, performance standards, at §414.1305 as the level of performance and methodology that the MIPS eligible clinician is assessed on for a MIPS performance period at the measures and activities level for all MIPS performance categories. We are finalizing at §414.1380(a) that MIPS eligible clinicians are scored under MIPS based on their performance on measures and activities in four performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

categories. MIPS eligible clinicians are scored against performance standards for each performance category and receive a final score, composed of their scores on individual measures and activities, and calculated according to the final score methodology. We are also finalizing at §414.1380(a)(1) that measures and activities in the four performance categories are scored against performance standards.

MIPS eligible clinicians will know, in advance of the performance period, the methodology for determining the performance standards and the methodology that will be used to score their performance. MIPS eligible clinicians will know the numerical performance standards in the quality performance category in advance of the performance period, when possible. A summary of the performance standards per performance category is provided in Table 15. As discussed in section II.E.6.a.(2) of this final rule with comment period, we are finalizing at §414.1380(a)(1)(i) that for the quality performance category, measures are scored between zero and 10 points. Performance is measured against benchmarks. Bonus points are available for both submitting specific types of measures and submitting measures using end-to-end electronic reporting. As discussed in section II.E.6.a.(3) of this final rule with comment period, we are finalizing at §414.1380(a)(ii) that for the cost performance category, that measures are scored between one and 10 points. Performance is also measured against benchmarks. As discussed in section II.E.6.a.(4), we are also finalizing at §414.1380(a)(iii) that for the improvement activities performance category each improvement activity is worth a certain number of points. The points for each reported activity are summed and scored against a total potential performance category score of 40 points as discussed in section. As discussed in section II.E.6.a.(5) of this final rule with comment period, we are finalizing at §414.1380(a)(iv), that for the advancing care information performance category, the performance category score is the sum of a base score, performance score, and bonus score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

As discussed in section II.E.6.a.(2) of this final rule with comment period, we are making changes to the quality performance category in response to comments received and are providing a minimum floor for all submitted measures to provide additional safeguards in the transition year. As discussed in section II.E.6.a.(4) of this final rule with comment period, we are making a minor modification to the improvement activities standard to provide additional clarification on improvement activities scoring and to align with comments received. Further, as discussed in section II.E.5.f of this final rule with comment period, we are making additional changes to the advancing care information performance category to align with comments received. We are also finalizing our definition of performance category score as defined in §414.1305 as the assessment of each MIPS eligible clinician's performance on the applicable measures and activities for a performance category for a performance period based on the performance standards for those measures and activities. Additionally, we are finalizing the definition of the term, MIPS payment year with a modification for further consistency with the statute. Specifically, MIPS payment year is defined at §414.1305 as a calendar year in which the MIPS payment adjustment factor, and if applicable the additional MIPS payment adjustment factor, are applied to Medicare Part B payments.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 15: Performance Category Performance Standards for the 2017 Performance Period**

<b>Performance Category</b>	<b>Proposed Performance Standard</b>	<b>Final Performance Standard</b>
Quality	Measure benchmarks to assign points, plus bonus points.	Measure benchmarks to assign points, plus bonus points with a minimum floor for all measures.
Cost	Measure benchmarks to assign points.	Measure benchmarks to assign points.
Improvement Activities	Based on participation in activities that align with the patient-centered medical home.  Number of points from reported activities compared against a highest potential score of 60 points.	Based on participation in activities listed in Table H of the Appendix final rule with comment period.  Based on participation as a patient-centered medical home or comparable specialty practice  Based on participation as an APM  Based on participation in the CMS study on improvement activities and measurement  Number of points from reported activities or credit from participation in an APM compared against a highest potential score of 40 points.
Advancing Care Information	Based on participation (base score) and performance (performance score).  Base score: Achieved by meeting the Protect Patient Health Information objective and reporting the numerator (of at least one) and denominator or yes/no statement as applicable (only a yes statement would qualify for credit under the base score) for each required measure. Performance score: decile scale for additional achievement on measures above the base score requirements, plus 1 bonus point.	Based on participation (base score) and performance (performance score).  Base score: Achieved by meeting the Protect Patient Health Information objective and reporting the numerator (of at least one) and denominator or yes/no statement as applicable (only a yes statement would qualify for credit under the base score) for each required measure. Performance score: Between zero and 10 or 20 percent per measure (as designated by CMS) based upon measure reporting rate, plus up to 15 percent bonus score.

(b) Unified Scoring System

Section 1848(q)(5)(A) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to performance standards for applicable measures and activities in each performance category applicable to the MIPS eligible clinician for a performance period. While MIPS has four different performance categories, we proposed a unified scoring system that enables MIPS eligible clinicians, beneficiaries, and stakeholders to understand what is required for a strong performance in MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

while being consistent with statutory requirements. We sought to keep the scoring as simple as possible, while providing flexibility for the variety of practice types and reporting options. We proposed to incorporate the following characteristics into the scoring methodologies for each of the four MIPS performance categories:

- For the quality and cost performance categories, all measures would be converted to a 10-point scoring system which provides a framework to universally compare different types of measures across different types of MIPS eligible clinicians. We noted that a similar point framework has been successfully implemented in several other CMS quality programs including the Hospital VBP Program.

- The measure and activity performance standards would be published, where feasible, before the performance period begins, so that MIPS eligible clinicians can track their performance during the performance period. This transparency would make the information more actionable to MIPS eligible clinicians.

- Unlike the PQRS or the EHR Incentive Program, we proposed that we generally would not include “all-or-nothing” reporting requirements for MIPS. The methodology would score measures and activities that meet certain standards defined in section II.E.5 of the proposed rule (81 FR 28181 through 28247) and this section of the final rule with comment period. However, section 1848(q)(5)(B)(i) of the Act provides that under the MIPS scoring methodology, MIPS eligible clinicians who fail to report on an applicable measure or activity that is required to be reported shall be treated as receiving the lowest possible score for the measure or activity. Therefore, MIPS eligible clinicians that fail to report specific measures or activities would receive zero points for each required measure or activity that they do not submit to MIPS.

- The scoring system would ensure sufficient reliability and validity by only scoring the measures that meet certain standards (such as the required case minimum). The standards are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

described later in this section.

- The scoring proposals provide incentives for MIPS eligible clinicians to invest and focus on certain measures and activities that meet high priority policy goals such as improving beneficiary health, improving care coordination through health information exchange, or encouraging APM Entity participation.

- Performance at any level would receive points towards the performance category scores.

We noted that we anticipated scoring in future years would continue to align and simplify. We requested comment on the characteristics of the proposed unified scoring system.

We also proposed at §414.1325 that MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one submission mechanism per performance category. For example, a MIPS eligible clinician could use one submission mechanism for sending quality measures and another for sending improvement activities data, but a MIPS eligible clinician could not use two submission mechanisms for a single performance category, such as submitting three quality measures via claims and three quality measures via registry. We did intend to allow flexibility, for example, in rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), we would score all the options (such as scoring the quality performance category with data from a registry, and also scoring the quality performance category with data from a QCDR) and use the highest performance category score for the MIPS eligible clinician final score. We would not however, combine the submission mechanisms to calculate an aggregated performance category score.

In carrying out MIPS, section 1848(q)(1)(E) of the Act requires the Secretary to encourage the use of QCDRs under section 1848(m)(3)(E) of the Act. In addition, section

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

1848(q)(5)(B)(ii) of the Act provides that under the methodology for assessing the total performance of each MIPS eligible clinician, the Secretary shall encourage MIPS eligible clinicians to report on applicable measures under the quality performance category through the use of CEHRT and QCDRs. To encourage the use of QCDRs, we proposed opportunities for QCDRs to report new and innovative quality measures. In addition, several improvement activities emphasize QCDR participation. Finally, we proposed under section II.E.5.a of the proposed rule (81 FR 28181) for QCDRs to be able to submit data on all MIPS performance categories. We believe these flexible options would allow MIPS eligible clinicians to meet the submission criteria for MIPS in a low burden manner, which in turn may positively affect their final score. We further believe these flexibilities encourage use of end-to-end electronic data extraction and submission where feasible today, and foster further development of methods that avoid manual data collection where automation is a valid, reliable option and that promote the goal of capturing data once and re-using it for multiple appropriate purposes.

In addition, section 1848(q)(5)(D) of the Act lays out the requirements for incorporating performance improvement into the MIPS scoring methodology beginning with the second MIPS performance period, if data sufficient to measure improvement is available. Section 1848(q)(5)(D)(ii) of the Act also provides that achievement may be weighted higher than improvement. Stated generally, we consider achievement to mean how a MIPS eligible clinician performs relative to performance standards, and improvement to mean how a MIPS eligible clinician performs compared to the MIPS eligible clinician's own previous performance on measures and activities in a performance category. Improvement would not be scored for the transition year of MIPS, but we solicited comment on how best to incorporate improvement scoring for all performance categories.

The following is a summary of the comments we received regarding our proposal for a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

unified scoring system.

Comment: Some commenters expressed support for the unified scoring system and agreed with having a unified and simplified scoring system, but some believed the proposed scoring methodology for MIPS is confusing and requires more alignment across performance categories. Commenters noted that physicians will not be able to understand how CMS calculated their score and would not know if appeals to CMS would be needed in order to correct information or plan for the future. Several commenters requested one single score, or fewer than four separate performance category scores, rather than aggregating individual scores for the four performance categories. Others noted the need for feedback prior to scoring. Others recommended simplifying the scoring system by aligning it across performance categories, and one commenter expressed concern about the total number of measures and activities across the four performance categories adding complexity to the scoring.

Response: Despite our efforts to create a transparent and standardized scoring system, we understand that some stakeholders may be concerned about the scoring complexity and may want more alignment across categories. We also understand stakeholders' requests for feedback prior to scoring. Several of our core objectives for MIPS are to promote program understanding and participation through customized communication, education, outreach and support, and to improve data and information sharing to provide accurate, timely, and actionable feedback to MIPS eligible clinicians. Prior to receiving a payment adjustment, MIPS eligible clinicians will receive timely confidential feedback on their program performance as discussed in section II.E.8.a of this final rule with comment period.

We have simplified the overall scoring approach for MIPS eligible clinicians in the transition year. Under this scoring approach, MIPS eligible clinicians who report measures/activities with minimal levels of performance will not be subject to negative payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustments if their final score is at or above the performance threshold. We believe having scores for individual performance categories aligns with the statute; however, we have provided numerous examples within section II.E.6.a.(2)(g) of this final rule with comment period to provide transparency as to how we will calculate MIPS eligible clinicians' scores and help MIPS eligible clinicians to understand how to succeed in the program. Further, we will continue to provide additional materials to create a transparent and standardized scoring system.

Comment: Commenters expressed concern that the unified scoring system may not allow consumers and payers to make meaningful comparisons across MIPS eligible clinicians. The commenters' reasons for concern include the varied reporting options and different score denominators.

Response: We have taken a patient-centered approach toward implementing our unified scoring system, which does allow for special circumstances for certain types of practices such as non-patient facing professionals, as well as small practices, rural practices and those in HPSA geographic areas. We believe our approach balances the interests of patients and payers while also providing flexibility for the variety of MIPS eligible clinician practices and encourages more collaboration across practice types.

Comment: Multiple commenters requested clarification on evaluating group performance within each of the four performance categories; specifically, whether it is CMS's intent to evaluate each individual within a group and somehow aggregate that performance into a composite group score or to evaluate the group as a single entity.

Response: Evaluation of group practices and individual practices is discussed under each performance category in sections II.E.5.b., II.E.5.e., II.E.5.f., and II.E.5.g. of this final rule with comment period.

Comment: One commenter requested that CMS explain the benefit of reporting via

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

QCDR and why this method is emphasized in the proposed rule.

Response: QCDRs have more flexibility to collect data from different data sources and to rapidly develop innovative measures that can be incorporated into MIPS. Therefore, we believe that QCDRs provide an opportunity for innovative measurement that is both relevant to MIPS eligible clinicians and beneficial to Medicare beneficiaries. In addition, section 1848(q)(1)(E) of the Act requires us to encourage the use of QCDRs.

Comment: Some commenters supported the removal of “all-or-nothing” scoring. One commenter encouraged CMS to create more partial-scoring opportunities.

Response: We appreciate the comment on the removal of “all-or-nothing” scoring. We will take these comments into consideration when considering additional recommendations for partial credit in future rulemaking

Comment: One commenter expressed concern that CMS cannot measure physician “performance” accurately. The commenter cited multiple sources that supported this statement.

Response: We recognize the challenges in measuring clinician performance and continue to work with stakeholders to address concerns.

After consideration of these comments, we are finalizing all of our policies related to unified scoring as proposed, except we are modifying our proposed policy on scoring quality measures.

We list below all policies we are finalizing related to our proposed unified scoring system.

- For the quality and cost performance categories, all measures will be converted to a 10-point scoring system which provides a framework to universally compare different types of measures across different types of MIPS eligible clinicians.

- The measure and activity performance standards will be published, where feasible,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

before the performance period begins, so that MIPS eligible clinicians can track their performance during the performance period.

- MIPS eligible clinicians who fail to report specific measures or activities would receive zero points for each required measure or activity that they do not submit to MIPS.

- The scoring policies provide incentives for MIPS eligible clinicians to invest and focus on certain measures and activities that meet high priority policy goals such as improving beneficiary health, improving care coordination through health information exchange, or encouraging APM Entity participation.

- Performance at any level would receive points towards the performance category scores.

We also are finalizing at §414.1325 that MIPS eligible clinicians and groups may elect to submit information via multiple mechanisms; however, they must use the same identifier for all performance categories and they may only use one submission mechanism per performance category. For example, a MIPS eligible clinician could use one submission mechanism for sending quality measures and another for sending improvement activities data, but a MIPS eligible clinician could not use two submission mechanisms for a single performance category, such as submitting three quality measures via claims and three quality measures via registry. We did intend to allow flexibility, for example, in rare situations where a MIPS eligible clinician submits data for a performance category via multiple submission mechanisms (for example, submits data for the quality performance category through a registry and QCDR), we will score all the options (such as scoring the quality performance category with data from a registry, and also scoring the quality performance category with data from a QCDR) and use the highest performance category score for the MIPS eligible clinician final score. We will not however, combine the submission mechanisms to calculate an aggregated performance category score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The one exception to this policy is CAHPS for MIPS, which is submitted using a CMS-approved survey vendor. CAHPS for MIPS can be scored in conjunction with other submission mechanisms.

With regard to the above policy, we note that some submission mechanisms allow for multiple measure types, such as a QCDR could submit data on behalf of an eligible clinician for a mixture of MIPS eCQMs and non-MIPS measures. However, we recognize that the scoring of only one submission mechanism in the transition year may influence which measures a MIPS eligible clinician selects to submit for the performance period. For example, a MIPS eligible clinician or group may only be able to report a limited number of measures relevant to their practice through a given submission mechanism, and therefore they may elect to choose a different submission mechanism through which a more robust set of measures relevant to their practice is available. We are seeking comment on whether we should modify this policy to allow combined scoring on all measures submitted across multiple submission mechanisms within a performance category. Specifically, we are seeking comment on the following questions:

- Would offering a combined performance category score across submissions mechanisms encourage electronic reporting and the development of more measures that effectively use highly reliable, accurate clinical data routinely captured by CEHRT in the normal course of delivering safe and effective care? If so, are there particular approaches to the performance category score combination that would provide more encouragement than others?
- What approach should be used to combine the scores for quality measures from multiple submission mechanisms into a single aggregate score for the quality performance category? For example, should CMS offer a weighted average score on quality measures submitted through two or more different mechanisms? Or take the highest scores for any submitted measure regardless of how the measure is submitted?

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- What steps should CMS and ONC consider taking to increase clinician and consumer confidence in the reliability of the technology used to extract, aggregate, and submit electronic quality measurement data to CMS?

- What enhancements to submission mechanisms or scoring methodologies for future years might reinforce incentives to encourage electronic reporting and improve reliability and comparability of CQMs reported by different electronic mechanisms?

We are modifying our proposed policy on scoring quality measures. Specifically, as discussed in section II.E.6.a.(2)(b) of this final rule with comment period, for the transition year, we are providing a global minimum floor of 3 points for all quality measures submitted. As discussed in section II.E.6.a.(2)(c) of the final rule with comment period, we are also modifying our proposed policy in which we would only score the measures that meet certain standards (such as required case minimum). For the transition year, we are automatically providing 3 points for quality measures that are submitted, regardless of whether they lack a benchmark or do not meet the case minimum or data completeness requirements. Finally, as discussed in section II.E.6.h of this final rule with comment period, we intend to propose options for scoring based on improvement through future rulemaking.

Various policies related to scoring the four performance categories are finalized at §414.1380(b) and described in more detail in sections II.E.6.a.(2), II.E.6.a.(3), II.E.6.a.(4), and II.E.5.g.(6) of this final rule with comment period.

#### (c) Baseline Period

In other Medicare quality programs, such as the Hospital VBP Program, we have adopted a baseline period that occurs prior to the performance period for a program year to measure improvement and to establish performance standards. We view the MIPS Program as necessitating a similar baseline period for the quality performance category. We intend to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

establish a baseline period for each performance period for a MIPS payment year to measure improvement for the quality performance category and to enable us to calculate performance standards that we can establish and announce prior to the performance period. As with the Hospital VBP Program, we intend to adopt one baseline period for each MIPS payment year that is as close as possible in duration to the performance period specified for a MIPS payment year. In addition, evaluating performance compared to a baseline period may enable other payers to incorporate MIPS benchmarks into their programs. For each MIPS payment year, we proposed at section II.E.6.a.(1)(c) of the proposed rule (81 FR 28250) that the baseline period would be the 12-month calendar year that is 2 years prior to the performance period for the MIPS payment year. Therefore, for the first MIPS payment year (CY 2019 payment adjustments), for the quality performance category, we proposed that the baseline period would be CY 2015 which is 2 years prior to the proposed CY 2017 performance period. As discussed in section II.E.6.a.(2)(a) of the proposed rule (81 FR 28251), we proposed to use performance in the baseline period to set benchmarks for the quality performance category, with the exception of new measures for which we would set the benchmarks using performance in the performance period and an exception for CMS Web Interface reporters, which will use the benchmarks associated with Shared Savings Program. For the cost performance category, we proposed to set the benchmarks using performance in the performance period and not the baseline period, as discussed in section II.E.6.a.(3) of the proposed rule (81 FR 28259). For the cost performance category, we also made an alternative proposal to set the benchmarks using performance in the baseline period. We proposed to define the term “measure benchmark” for the quality and cost performance categories (81 FR 28250) as the level of performance that the MIPS eligible clinician will be assessed on for a performance period at the measures and activities level.

The following is a summary of the comments we received regarding our proposal to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

define the baseline period.

Comment: One commenter expressed concern that baseline scoring may be misaligned when using benchmarks from 1 year for the cost performance category and a different year for measures in the quality performance category. Multiple commenters believe all categories should use the same year to determine benchmarks. Some commenters requested that CMS measure MIPS eligible clinicians as close as possible to the performance period, ideally, less than 2 years from the performance period. Others noted concern about the ability of a clinician to correct actions with 2-year old data.

Response: Ideally, we would like to have data sources for our benchmarks aligned across the quality and cost performance categories. However, we have purposefully chosen different periods for the quality and cost performance categories. We proposed to use the baseline period for benchmarks for the quality performance category so that MIPS eligible clinicians can know quality performance category benchmarks in advance; however, we believe there are disadvantages to benchmarking cost measures to a previous year. For example, development of a new technology or a change in payment policy could result in a significant change in typical cost from year to year. Therefore, for more accurate data, it is better to build cost benchmarks from performance period data than the baseline period. We believe there is more value in the advance notice for quality performance measures so that MIPS eligible clinicians can benchmark themselves for quality measures when historical data is available. In contrast, for the cost performance category, we believe it is more beneficial to base benchmarks on the performance period. After considering comments, we are finalizing that the baseline period will be the 12-month calendar year that is 2 years prior to the performance period for the MIPS payment year. We believe that 2 years is the most recent data we can use to develop benchmarks prior to the performance period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We will use performance in the baseline period to set benchmarks for the quality performance category, with the exception of new quality measures, or quality measures that lack historical data, for which we would set the benchmarks using performance in the performance period, and an exception for CMS Web Interface reporters which we will use the benchmarks associated with the Shared Savings Program. For the cost performance category, we will set the benchmarks using performance in the performance period and not the baseline period. We are defining the term “measure benchmark” for the quality and cost performance categories at §414.1305 as the level of performance that the MIPS eligible clinician is assessed on for a specific performance period at the measures and activities level.

## (2) Scoring the Quality Performance Category

In section II.E.5.b.(3) of the proposed rule, we proposed multiple ways that MIPS eligible clinicians may submit data for the quality performance category to MIPS; however, we proposed that the scoring methodology would be consistent regardless of how the data is submitted. In summary, we proposed at §414.1380(b)(1) to assign 1-10 points to each measure based on how a MIPS eligible clinician’s performance compares to benchmarks. Measures must have the required case minimum to be scored. We proposed that if a MIPS eligible clinician fails to submit a measure required under the quality performance category criteria, then the MIPS eligible clinician would receive zero points for that measure. We proposed that MIPS eligible clinicians would not receive zero points if the required measure is submitted (meeting the data completeness criteria as defined in section II.E.5.b.(3)(b) of the proposed rule (81 FR 28188) but is unable to be scored for any of the reasons listed in section II.E.6.a.(2) of the proposed rule (81 FR 28250), such as not meeting the required case minimum or a measure lacks a benchmark. We described in section II.E.6.a.(2)(d) of the proposed rule (81 FR 28254), examples of how points would be allocated and how to compute the overall quality performance category score

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

under these scenarios. Bonus points would be available for reporting high priority measures, defined as outcome, appropriate use, efficiency, care coordination, patient safety, and patient experience measures.

As discussed in section II.E.6.a.(2)(g) of the proposed rule (81 FR 28256), the quality performance category score would be the sum of all the points assigned for the scored measures required for the quality performance category plus the bonus points (subject to the cap) divided by the sum of total possible points. Examples of the calculations were provided in the proposed rule (81 FR 28256).

In section II.E.6.b of the proposed rule (81 FR 28269), we discussed how we would score MIPS eligible clinicians who do not have any scored measures in the quality performance category. The details of the proposed scoring methodology for the quality performance category are described below.

#### (a) Quality Measure Benchmarks

For the quality performance category, we proposed at section II.E.6.a.(2)(a) of the proposed rule (81 FR 28251) that the performance standard is measure-specific benchmarks. Benchmarks would be determined based on performance on measures in the baseline period. For quality performance category measures for which there are baseline period data, we proposed to calculate an array of measure benchmarks based on performance during the baseline period, breaking baseline period measure performance into deciles. Then, a MIPS eligible clinician's actual measure performance during the performance period would be evaluated to determine the number of points that should be assigned based on where the actual measure performance falls within these baseline period benchmarks. If a measure does not have baseline period information (for example, new measures), or if the measure specifications for the baseline period differ substantially from the performance period (for example, when the measure requirements

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

change due to updated clinical guidelines), then we proposed to determine the array of benchmarks based on performance on the measure in the performance period, breaking the actual performance on the measure into deciles. In addition, we proposed to create separate benchmarks for submission mechanisms that do not have comparable measure specifications. For example, several eCQMs have specifications that are different than the corresponding measure from registries. We proposed to develop separate benchmarks for EHR submission mechanisms, claims submission mechanisms, and QCDRs and qualified registry submission mechanisms.

For CMS Web Interface reporting, we proposed to use the benchmarks from the Shared Savings Program as described at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharedsavingsprogram/Quality-Measures-Standards.html>, which were finalized in previous rulemaking<sup>21</sup>. We proposed to adopt the Shared Savings Program performance year benchmarks for measures that are reported through the CMS Web Interface for the MIPS performance period, but proposed to apply the MIPS method of assigning 1 to 10 points to each measure as an alternative to calculating separate MIPS benchmarks. Because the Shared Savings Program does not publicly post or use benchmarks below the 30<sup>th</sup> percentile, we proposed to assign all scores below the 30<sup>th</sup> percentile a value of 2 points, which is consistent with the mid-cluster approach we proposed for topped out measures. We believed using the same benchmarks for MIPS and the Shared Savings Program for the CMS Web Interface measures would be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

appropriate because, as is discussed in the proposed rule (81 FR 28237 through 28243), we proposed to use the MIPS benchmarks to score MIPS eligible clinicians in the Shared Savings Program and the Next Generation ACO Model on the quality performance category and believe it is important to not have conflicting benchmarks. We would post the MIPS CMS Web Interface benchmarks with the other MIPS benchmarks.

As an alternative approach, we considered creating CMS Web Interface specific benchmarks for MIPS instead of using the Shared Savings Program benchmarks. This alternative approach for MIPS benchmarks would be restricted to CMS Web Interface reporters and would not include other MIPS data submission methods or other data sources which are currently used to create the Shared Saving Program benchmarks. This alternative would also apply the topped out cluster approach if any measures are topped out. While we see benefit in having CMS Web Interface methodology match the other MIPS benchmarks, we are also concerned about the Shared Saving Program and the Next Generation ACO Model participants having conflicting benchmark data. We requested comments on building CMS Web Interface specific benchmarks.

We proposed that all MIPS eligible clinicians, regardless of whether they report as an individual or group, and regardless of specialty, that submit data using the same submission mechanism would be included in the same benchmark. We proposed to unify the calculation of the benchmark by using the same approach as the VM of weighting the performance rate of each MIPS eligible clinician and group submitting data on the quality measure by the number of beneficiaries used to calculate the performance rate so that group performance is weighted appropriately (77 FR 69321 through 69322). We would also include data from APM Entity submissions in the benchmark but would not score APM Entities using the MIPS scoring methodology. For APM scoring, we refer to section II.E.5.h. of the proposed rule (81 FR 28234).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

To ensure that we have robust benchmarks, we proposed that each benchmark must have a minimum of 20 MIPS eligible clinicians who reported the measure meeting the data completeness requirement defined in section II.E.5.b.(3) of the proposed rule (81 FR 28185), as well as meeting the required case minimum criteria for scoring that is defined later in this section. We proposed a minimum of 20 because, as discussed below, our benchmarking methodology relies on assigning points based on decile distributions with decimals. A decile distribution requires at least 10 observations. We doubled the requirement to 20 so that we would be able to assign decimal point values and minimize cliffs between deciles. We did not want to increase the benchmark sample size requirement due to concerns that an increase could limit the number of measures with benchmarks.

We also proposed that MIPS eligible clinicians who report measures with a performance rate of 0 percent would not be included in the benchmarks. In our initial analysis, we identified some measures that had a large cluster of eligible clinicians with a 0 percent performance rate. We were concerned that the 0 percent performance rate represents clinicians who are not actively engaging in that measurement activity. We did not want to inappropriately skew the distribution. We solicited comment on whether or not to include 0 percent performance in the benchmark.

We proposed at §414.1380(b)(1)(i) to base the benchmarks on performance in the baseline period when possible. We proposed to publish the numerical benchmarks when possible, prior to the start of the performance period. In those cases, where we do not have comparable data from the baseline period, we proposed to use information from the performance period to establish benchmarks. While the benchmark methodology would be established in a final rule in advance of the performance period, we proposed that the actual numerical benchmarks would not be published until after the performance period for quality measures that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

do not have comparable data from the baseline period. The methodology for creating the benchmarks was discussed in the proposed rule (81 FR 28251).

We considered not scoring measures that either are new to the MIPS program or do not have a historical benchmark based on performance in the baseline period. This policy would be consistent with the VM policy in which we do not score measures that have no benchmark (77 FR 69322). However, in the proposed rule (81 FR 28252), we expressed concern that such a policy could stifle reporting on innovative new measures because it would take several years for the measure to be incorporated into the performance category score. We also believed that any issues related to reporting a new measure would not disproportionately affect the relative performance between MIPS eligible clinicians.

We also considered a variation on the scoring methodology that would provide a floor for a new MIPS measure. Under this variation, if a MIPS eligible clinician reports a new measure under the quality performance category, the MIPS eligible clinician would not score lower than 3 points for that measure. This would encourage reporting on new measures, but also prevent MIPS eligible clinicians from receiving the lowest scores for a new measure, while still measuring variable performance. Finally, we also considered lowering the weight of a new measure, so that new measures would contribute relatively less to the score compared to other measures. In the end, we did not propose the alternatives we considered, because we wanted to encourage adoption and measured performance of new measures, however, we did request comment on these alternatives, including comments on what the lowest score should be for MIPS eligible clinicians who report a new measure under the quality performance category and protections against potential gaming related to reporting of new measures only. We also sought comments on alternative methodologies for scoring new measures under the quality performance category, which would assure equity in scoring between the methodology for measures for which

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

there is baseline period data and for new measures which do not have baseline period data available.

Finally, we clarified that some PQRS reporting mechanisms have limited experience with all-payer data. For example, under PQRS, all-payer data was permitted only when reporting via registries for measure groups; reporting via registries for individual measures was restricted to Medicare only. Under MIPS, however, we proposed to have more robust data submissions, as described in section II.E.5.b.(3) of the proposed rule (81 FR 28188). We recognized that comparing all-payer performance to a benchmark that is built, in part, on Medicare data is a limitation and noted we would monitor the benchmarks to see if we need to develop separate benchmarks. We also noted that this data issue would resolve in a year or two, as new MIPS data becomes the historical benchmark data in future years.

The following is a summary of the comments we received regarding our proposals for quality measure benchmarks.

Comment: Commenters generally supported our proposed approach: some commenters supported the establishment of separate benchmarks for submission mechanisms that do not have comparable measure specifications, and another supported using national benchmarks and linear-based scoring in the MIPS performance scoring methodology.

Response: We agree with commenters and are finalizing at 414.1380(b)(1)(iii) the establishment of separate benchmarks for the following submission mechanisms: EHR submission options; QCDR and qualified registry submission options; claims submission options; CMS Web Interface submission options; CMS-approved survey vendor for CAHPS for MIPS submission options; and administrative claims submission options. We note that the administrative claims benchmarks are for measures derived from claims data, such as the readmission measure. As discussed below, the CMS Web Interface submission benchmarks will

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

be the same as the Shared Savings Program benchmarks for the corresponding Shared Savings Program performance period. We note that assigning separate benchmarks in this manner creates opportunities for clinicians to achieve higher quality scores by selectively choosing submission mechanisms; as discussed in section II.E.5.a.(2) in this final rule with comment period, we intend to monitor for such activity and to report back on any findings from our monitoring in future rulemaking.

Comment: Commenters requested that CMS provide each measure's benchmarks in advance, with one recommending that CMS do so in the final rule and in future proposed rules so that MIPS eligible clinicians know their target goals or, alternatively, that CMS hold a listening session for input on benchmarks for each measure. The commenters stated that they did not want to be held accountable for performance if benchmarks cannot be provided in advance. One commenter noted that it would be difficult to gauge performance and areas for improvement since benchmarks would not be released in time and real time feedback is needed.

Response: We agree with commenters that quality benchmarks should be made public and should be known in advance when possible so that MIPS eligible clinicians can understand how they will be measured. We are finalizing that measure benchmarks are based on historical performance for the measures based on a baseline period. Those benchmarks will be known in advance of the performance period. We finalize this approach with one exception. The CMS Web Interface will use benchmarks from the corresponding performance year of the Shared Savings Program and not the baseline year. Those benchmarks are also known in advance of the performance period.

When no comparable data exists from the baseline period, then we finalize that we will use information from the performance period (CY 2017 for the transition year, during which MIPS eligible clinicians may report for a minimum of any continuous 90-day period, as

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

discussed in section II.E.4 of this final rule with comment period) to assess measure benchmarks.

In this case, while the benchmark methodology is being finalized in this final rule with comment period, the numerical benchmarks will not be known in advance of the performance period.

However, as discussed throughout this final rule with comment period, we have added protections to protect MIPS eligible clinicians from poor performance, particularly in the transition year.

Comment: Some commenters did not support the use of 2015 data or other historical data to set the 2017 benchmarks, with one commenter stating that CMS would be using data from periods during which MIPS did not exist and requesting that CMS establish an adequate foundation for benchmarks based on MIPS data. One commenter recommended that CMS not set benchmarks or hold clinicians accountable for performance until it has established an adequate foundation based on MIPS data. Another emphasized using reliable and valid patient sample sizes or adequate foundation of data to determine benchmarks even if only for limited number of measures.

Response: In establishing the performance standards, we had to choose between two feasible alternatives: either develop benchmarks based on historical data and provide the numerical benchmarks in advance of the performance period; or use more current data for benchmarks and not provide the numerical benchmarks in advance of the performance period. We believe there is more value in providing advance notice for quality performance category measures so that MIPS eligible clinicians can set a clear performance goal for these measures, provided that historical data is available. In many cases, MIPS quality measures are the same as those available under PQRS, so we believe that using PQRS data is appropriate for a MIPS benchmark. In contrast, we do not believe there is more value in providing advance notice for cost performance category measures since the claims data for the cost performance category can

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

vary due to payment policies, payment rate adjustment and other factors. Therefore, we believe having the cost performance category measures based on performance period data will be more beneficial to MIPS eligible clinicians given that it is based on more current data. For the cost performance category, we believe it is more beneficial to base performance on the performance period.

Comment: A few commenters opposed our benchmarking approach, with some opposing our proposal to separate benchmarks solely by submission mechanism given that medical groups vary by size, location, specialty and other factors which should be built into developing the benchmarks. Commenters recommended specialty-specific benchmarks, benchmarking by region, and benchmarks based on group size (for example, groups with 10-50 clinicians, 51-100 clinicians, 101-500 clinicians, 501-1,000 clinicians, and >1,000 clinicians). In other words, commenters did not believe in one overall benchmark but rather that groups should be compared only to other similar groups (for example, APM entities to APM entities, individuals to individuals, clinicians by specialty and groups to groups, small practices to small practices, or region by region).

Response: We want the benchmarks to be as broad and inclusive as possible and to establish a single performance standard whenever the measure specifications are comparable. We finalized separate benchmarks by submission mechanism only when the differences in specifications make comparisons less valid. We do not believe differences in specialty, group size, and region create an inherent need for separate benchmarks as the specifications are comparable across each of these categories. Furthermore, we do not expect differences in location, practice size, and other characteristics to impact the quality of care provided. We also want to keep robust sample sizes in each benchmark, and stratifying a benchmark by different characteristics would risk fragmenting the sample size in such a manner that we do not have a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

valid benchmark for some measures.

We estimated quality performance scores by practice size based on historical data and did not see a systematic difference in performance by practice among MIPS eligible clinicians that submitted complete and reliable data to require a need for separate benchmarks. However, as we monitor the MIPS program, we will continue to evaluate whether we need to further refine and stratify the benchmarks.

Comment: One commenter recommended that CMS should analyze the quality performance data by looking at Medicare and non-Medicare populations separately, and should also examine whether stratifying the performance data by specialty code, site-of-service code, or both will result in more accurate measurement and fair adjustments for physicians who treat the sickest patients.

Response: We want accurate and fair measurement in the MIPS program. We have incorporated measures that have gone through public review. In many cases, we believe the measure developers have considered scenarios where risk adjustment is required to consider mix of patient population and site-of-service and do not believe we need a separate universal policy to further stratify performance by patient mix, specialty, or site of service for all measures. As we move through the transition year, however, we will continue to evaluate the need for additional adjustments or stratification for informational purposes and would make any proposed adjustments through future rulemaking.

Comment: One commenter expressed their belief that integrating data from MIPS eligible clinicians participating in MIPS APMs with data from MIPS eligible clinicians who do not participate in APMs will skew the universe of reported data toward better performance, as MIPS APM participants tend to be more advanced and well resourced, putting MIPS eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

who do not participate in APMs at a disadvantage in scoring. The commenter recommended segregating such data for purposes of setting MIPS benchmarks for 2019 payment adjustments.

Response: As discussed above, we believe in having inclusive and robust datasets as possible for benchmarks. We note that we are building benchmarks by comparable submission mechanism and not all submission mechanisms will have APM data; however, we believe it is important to include APM participants when comparable information is available because the benchmark represents the true distribution of performance. We do not want to establish separate, potentially lower, standards of care for clinicians who are not in APMs. In addition, as more MIPS eligible clinicians transition to APMs, we may not have sufficient volume to create benchmark based on MIPS eligible clinicians alone.

Comment: A few commenters believed CMS should not allow a “new” physician's quality measure performance to count against the practice under Quality Payment Program if they have not been with that practice greater than 6 months. Another commenter recommended that CMS allow physicians who practice less than 12 months to self-identify so that their scoring can take into account the physician’s limited data.

Response: We appreciate the commenter’s feedback and will restrict the data for the benchmarks to MIPS eligible clinicians and, as discussed above, the benchmarks will include comparable APM data, including data from QPs and Partial QPs. We believe these steps will help ensure that the validity and completeness of the benchmark data.

Comment: Some commenters expressed concern regarding the comparability of measures from different EHR vendor systems. One commenter noted that data submitted from different EHR vendor systems may use different methodologies, as well as inconsistent numerators and denominators, and will therefore not be comparable across systems and clinicians. This commenter recommended that CMS work with ONC to standardize data

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

submitted to Medicare across a number of vendor systems. Another commenter requested that CMS incorporate work by medical societies to implement guides to ensure eCQM calculations and benchmarks are accurate and that different EHRs are accurately capturing eCQMs. Another commenter cautioned that in the case of EHRs, eCQMs are also not uniformly calculated across EHRs, as several different administrative code sets are used. This commenter recommended that CMS create standards and mapping tools to facilitate working across these different codes, ensure consistency when EHR data is exchanged, and ensure eCQM calculations and benchmarks are accurate. The commenter also noted that different EHRs are more accurate at capturing eCQMs.

Response: To date, there have been issues with EHR data accuracy and consistency. We have worked with ONC to address these issues through public feedback mechanisms, the availability of tools to support eCQM testing and value set uploads, and by encouraging vendors to consume the health quality measure format (HQMF) measure specifications directly. As these improvements penetrate to all systems in use by providers, we expect to see improvements in eCQM consistency. We will continue to work with ONC to continue considering the elimination of transitional code systems to further improve alignment of the eCQM data elements, and we will continue to engage with sites and stakeholder organizations to identify methods to further ensure consistency across sites and systems.

Comment: Commenters generally supported our proposal to use the Shared Savings benchmarks for CMS Web Interface. One commenter supported our alternative approach of building our own benchmarks for CMS Web Interface measures.

Response: We appreciate the commenters support and are finalizing our proposal to use the Shared Savings benchmarks for the CMS Web Interface. However, as we discuss in more detail below, we are adding a floor of 3 points for each measure for the transition year.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Therefore, any values that are below the 30<sup>th</sup> percentile will receive a score of 3 points.

Comment: Some commenters agreed that 0 percent performance rates should be excluded from benchmark calculations. One commenter suggested including 0 percent performance rates in benchmark calculations but distinguishing the data that was intentionally submitted from data that was unintentionally submitted from EHR reporting. Another commenter suggested rewarding clinicians that reported on a measure if more than 50 percent of MIPS eligible clinicians reported zero on that measure and removing zeroes would artificially increase the benchmark for any given measure.

Response: We appreciate that in some circumstances a 0 performance rate may be a valid score; however, we are also concerned about skewing the distribution with potentially inaccurate scores. We are finalizing the policy to exclude 0 percent scores from the benchmarks for the transition year. We will continue to evaluate the impact of 0 percent scores on benchmarks. However, as described below, we are adding a floor for the transition year of MIPS, which will limit the effect of this adjustment on MIPS eligible clinicians' scores.

Comment: One commenter did not agree with our proposal to use the Value Modifier approach to weight the performance of individuals and groups by the number of beneficiaries to create a single set of benchmarks. The commenter was concerned about combining both individuals and groups into one set of benchmarks. The commenter recommended simplifying the performance standards and incorporating aspects of the Shared Savings Program and VM into this MIPS category.

Response: As discussed above, we believe that both individuals and groups reporting through the same submission mechanism are comparable, as the measure specifications are similar. In the proposed rule, we proposed to combine the group and individual data into a single benchmark by using the VM approach of patient weighting. However, after further analysis, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

do not believe this approach is appropriate for the MIPS program.

The VM defines relative performance as statistical difference from the mean for a measure, and weights each clinician's performance rate by the number of beneficiaries to identify the average score for a measure, a single unit. However, unlike the VM, in MIPS, we are not defining relative performance by using a single point, but rather a percentile distribution of the reliable clinician summary performance scores. We have taken steps to ensure that each clinician or group score meets certain standards to promote reliability at the group or individual clinician level. For example, the group or individual reporter must meet certain case volume and data completeness standards to be included in the MIPS benchmark. In MIPS, weighting individual or group values by the number of patients is similar to cloning or replicating that individual or group score in the percentile distribution. In a distribution benchmark, weighting will not have an impact in the following cases: when the distribution of scores is highly compressed (low variance); the distribution of cases is highly compressed (such as, all practices have fairly similar numbers of cases); or when the number of practices is large relative to the typical number of eligible cases for any practice for the measure. However, the difference between unweighted and weighted benchmarks is more likely to have an impact is when the number of eligible cases and corresponding performance scores vary widely across practices. The difference will be exacerbated if there are relatively few practices and/or if practices with especially high or low scores also have a disproportionately large number of cases. For example, assume a given benchmark has one large group and several smaller groups and individual reporters. The large group cares for 20 percent of the beneficiaries represented in the benchmark. If we weight the benchmark by patient weight, then another MIPS eligible clinician with a score just above or just below that performance rate will have a score that is different by a point or two, not because of differences in performance but because of differences in the number

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of beneficiaries cared for by the group or individual MIPS eligible clinician.

Therefore, we are not finalizing our proposal to patient weight the benchmarks. Instead, we will count each submission, either by individual or group, as a single data point for the benchmark. We believe this data is reliable and the revision simplifies the combination of group and individual performance.

Comment: Some commenters did not agree with our proposal to use performance period data to set benchmarks in instances where the measure is a new measure or there is a change to an existing measure. Instead, the commenter recommended just giving credit for reporting the measure. Another commenter recommended that new measures receive a score equal to the 90th percentile if the reporting rates are met. Another commenter supported not scoring new quality measures until 2 years after introduction. Another commenter recommended that MIPS eligible clinicians reporting new measures be held harmless from negative scoring.

Response: To encourage meaningful measurement, we want to score all available measures for performance, including new measures. However, because new measures would not have a benchmark available prior to the start of the performance period; we are creating a 3-point new measure floor specifically for new measures and measures without a benchmark based on baseline period data. This floor would be available annually to any measure without a published benchmark. Generally, we would expect new measures to have the 3-point floor for the first 2 years until we get baseline data for that measure. This approach helps to ensure that the MIPS eligible clinicians are protected from a poor performance score that they would not be able to anticipate. As we discussed in section II.E.6.a.(2)(b) below, we are also setting a global 3-point floor for all submitted measures during the transition year. We would like to note that the global 3-point floor for all measures is a policy for the transition year of MIPS. In contrast, the new measure 3-point floor for measures without a previously published benchmark, such as new

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures, would be available in future years of MIPS and not just the transition year. We also note that the new measure 3-point floor for measures without a previously published benchmark, is different than class 2 measures, as defined later in section II.E.6.a.(2)(c) of this rule and summarized in Table 17, that lack a benchmark because we do not have a minimum of 20 MIPS eligible clinicians who reported the measure meeting the case minimum and data completeness requirements. The new measure 3-point floor allows MIPS eligible clinicians to be scored on performance in which the lowest score possible for a measure will be 3 points, and the highest possible score is 10 points assuming the new measure has a benchmark and the MIPS eligible clinician has met the case minimum and data completeness criteria. However, the class 2 measures, as defined in Table 17, is not a floor but rather an automatic score of 3 points, in which MIPS eligible clinicians are not scored on performance and would only receive 3 points for that measure.

We considered giving a set number of points for submitting a new measure, rather than measuring performance. We do not think it is equitable to give the maximum performance score (a score equal to the 90<sup>th</sup> percentile or the top decile) when other eligible clinicians may receive fewer points based on performance.

Comment: Many commenters expressed support for our alternative approach that if a MIPS eligible clinician reports a new measure under the quality performance category, the MIPS eligible clinician will not score lower than 3 points for that measure. One commenter agreed with the assessment that this would encourage clinicians to report new measures, prevent clinicians from gaming the system by reporting only on new measures to avoid being compared to a benchmark, and still incentivize better performance on the new measure. This commenter also expressed support for the alternative to weight new measures less than measures with existing benchmark data, stating that this will also accomplish the above goals. Two

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenters recommended that CMS apply this minimum floor proposal both to the transition year in which the measure is available in MIPS and to the first time the eligible clinician reports on the measure. One commenter noted that this will encourage reporting on new measures and help mitigate potential unintended consequences.

Response: We are finalizing the alternative approach for the scoring of new measures, or measures without a comparable historical benchmark, to have a floor of 3 points until baseline data can be utilized. We note that the floor only applies when the new measure does not have a benchmark based on baseline data and not the first time the eligible clinician reports on the measure in subsequent years.

In addition, for the transition year (first year) only, we are also implementing a global floor of 3 points for all submitted quality measures, not only new measures. This floor, along with changes in the performance threshold, affords MIPS eligible clinicians the ability to learn about MIPS and be protected from a negative adjustment in the transition year for any level of performance.

Comment: One commenter noted that, while ensuring that an eligible clinician reporting a new measure would not receive a score lower than three points may incentivize reporting of new measures, the commenter was concerned that doing so may artificially inflate the measure's benchmark, and adversely affect clinicians reporting the measure in year 2, during which time scoring would no longer be based on an inflated benchmark. This commenter recommended that CMS establish measure benchmarks based only on true measure performance instead of potentially inflated, incentivized performance.

Response: We would like to note that the benchmarks are based on the performance rates for the measures, not on the assigned points. Therefore, the floor for new measures should not affect future benchmarks. Table 16 has an example of how the floor would work.

**TABLE 16: Example of Using Benchmarks for a Single Measure to Assign Points With a Floor of 3 Points**

Benchmark Decile	Sample Quality Measure Benchmarks	Possible Points with 3-Point Floor	Possible Points Without 3-Point Floor
Benchmark Decile 1	0.0-9.5%	3.0	1.0-1.9
Benchmark Decile 2	9.6-15.7%	3.0	2.0-2.9
Benchmark Decile 3	15.8-22.9%	3.0-3.9	3.0-3.9
Benchmark Decile 4	23.0-35.9%	4.0-4.9	4.0-4.9
Benchmark Decile 5	36.0-40.9%	5.0-5.9	5.0-5.9
Benchmark Decile 6	41.0-61.9%	6.0-6.9	6.0-6.9
Benchmark Decile 7	62.0-68.9%	7.0-7.9	7.0-7.9
Benchmark Decile 8	69.0-78.9%	8.0-8.9	8.0-8.9
Benchmark Decile 9	79.0-84.9%	9.0-9.9	9.0-9.9
Benchmark Decile 10	85.0%-100%	10	10

In this example, we still create an array of percentile distributions for benchmarks and decile breaks. However, where we would normally assign between 1.0-2.9 points for MIPS eligible clinicians with performance in the first or second deciles (in this example, performance between 0 and 15.7 percent), we will now assign 3.0 points. In future years, however, as baseline data becomes available for new measures, we would remove the floor and assign points less than 3, as illustrated above. For example, a performance rate of 9.6 percent (start of the 2<sup>nd</sup> decile), would receive 3.0 points with the floor and only 2.0 points without the floor. This methodology will not affect the scoring for MIPS eligible clinicians with performance in the third decile or higher. In addition, this methodology will not affect the calculation of future benchmarks. We do note, however, that if a MIPS eligible clinician consistently has poor performance, then by the time the baseline data can be used, the MIPS eligible clinician may receive fewer points because the floor has been removed.

After consideration of the comments on quality measure benchmarks, we are finalizing many policies as proposed. Specifically:

- For quality measures for which baseline period data is available, we are establishing at §414.1380(b)(1)(i) measure benchmarks are based on historical performance for the measure

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

based on a baseline period. Each benchmark must have a minimum of 20 individual clinicians or groups who reported the measure meeting the data completeness requirement and minimum case size criteria and performance greater than zero. We will restrict the benchmarks to data from MIPS eligible clinicians, and, as discussed above, comparable APM data, including data from QPs and Partial QPs.

We will publish the numerical baseline period benchmarks prior to the start of the performance period (or as soon as possible thereafter).

- For quality measures for which there is no comparable data from the baseline period, we are establishing at §414.1380(b)(1)(ii) that CMS will use information from the performance period to create measure benchmarks. We will publish the numerical performance period benchmarks after the end of the performance period. In section II.E.4 of this final rule with comment period, we are finalizing that for the transition year, the performance period will be a minimum of any continuous 90-day period within CY 2017. Therefore, for MIPS payment year 2019, we will use data submitted for performance in CY 2017, during which MIPS eligible clinicians may report for a minimum of any continuous 90-day period.

- We are establishing at §414.1380(b)(1)(iii) separate benchmarks are used for the following submission mechanisms: EHR submission options; QCDR and qualified registry submission options; claims submission options; CMS Web Interface submission options; CMS-approved survey vendor for CAHPS for MIPS submission options, and administrative claims submission options. As discussed above, we are not stratifying benchmarks by other practice characteristics, such as practice size. For the reasons discussed above, we do not believe that there is a compelling rationale for such an approach, and we believe that stratifying could have unintended negative consequences for the stability of the benchmarks, equity across practices, and quality of care for beneficiaries. However, we continue to receive feedback that small

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

practices should have a different benchmark, so we seek comment on any rationales for or against stratifying by practice size we may not have considered.

- We are establishing at §414.1380(b)(1)(ii)(A) that the CMS Web Interface submission will use benchmarks from the corresponding reporting year of the Shared Savings Program. We will post the MIPS CMS Web Interface benchmarks in the same manner as the other MIPS benchmarks. We are not building CMS Web Interface-specific benchmarks for the MIPS. We will apply the MIPS scoring methodology to each measure. Measures below the 30<sup>th</sup> percentile will be assigned a value of 3 points during the transition year to be consistent with the global floor established in this rule for other measures. We will revisit this global floor for future years.

We are modifying our proposed policy with regards to patient weighting. Based on public comments, we are not finalizing our proposal to weight the performance rate of each MIPS eligible clinician and group submitting data on the quality measure by the number of beneficiaries used to calculate the performance rate. Instead, we will count each submission, either by an individual or group, as a single data point for the benchmark. We believe the original proposal could create potential unintended distortions in the benchmark. Therefore we believe it is more appropriate to use a distribution of each individual or group submission that meets our criteria to ensure reliable and valid data.

We are also modifying our proposed policy for scoring new measures. Based on public comments, for the transition year and subsequent years of MIPS, we are adding protection against being unfairly penalized for poor performance on measures without benchmarks by finalizing a 3-point floor for new measures and measures without a benchmark. As discussed in more detail in the next section, for the transition year of MIPS we are also finalizing a 3-point floor for all submitted measures. We will revisit this policy in future years.

#### (b) Assigning Points Based on Achievement

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We proposed in §414.1380(b)(1)(x) of the proposed rule (81 FR 28251) to establish benchmarks using a percentile distribution, separated into deciles, because it translates measure-specific score distributions into a uniform distribution of MIPS eligible clinicians based on actual performance values. For each set of benchmarks, we proposed to calculate the decile breaks for measure performance and assign points for a measure based on the benchmark decile range in which the MIPS eligible clinician's performance rate on the measure falls. For example, MIPS eligible clinicians in the top decile would receive 10 points for the measure, and MIPS eligible clinicians in the next lower decile would receive points ranging from 9 to 9.9. We proposed to assign partial points to prevent performance cliffs for MIPS eligible clinicians near the decile breaks. The partial points would be assigned based on the percentile distribution.

Table 17 of the proposed rule (81 FR 28252) illustrated an example of using decile points along with partial points to assign achievement points for a sample quality measure. We noted in the proposed rule (81 FR 28252) that any MIPS eligible clinician who reports some level of performance would receive a minimum of one point for reporting if the measure has the required case minimum, assuming the measure has a benchmark.

We did not propose to base scoring on decile distributions for the same measure ranges as described in Table 17 of the proposed rule when performance is clustered at the high end (that is, “topped out” measures), as true variance cannot be assessed. MIPS eligible clinicians report on different measures and may elect to submit measures on which they expect to perform well. For MIPS eligible clinicians electing to report on measures where they expect to perform well, we anticipated many measures would have performance distributions clustered near the top. We proposed to identify “topped out” measures by using a definition similar to the definition used in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the Hospital VBP Program: Truncated Coefficient of Variation<sup>22</sup> is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors;<sup>23</sup> or median value for a process measure that is 95 percent or greater (80 FR 49550).<sup>24</sup>

Using 2014 PQRS quality reported data measures, we modeled the proposed benchmark methodology and identified that approximately half of the measures proposed under the quality performance category are topped out. Several measures have a median score of 100 percent, which makes it difficult to assess relative performance needed for the quality performance category score.

However, we did not believe it would be appropriate to remove topped out measures at this time. As not all MIPS eligible clinicians would be required to report these measures under our proposals for the quality performance category in section II.E.5.b. of the proposed rule (81 FR 28184), it would be difficult to determine whether a measure is truly topped out or if only excellent performers are choosing to report the measure. We also believed removing such a large volume of measures would make it difficult for some specialties to have enough applicable measures to report. At the same time, we did not believe that the highest values on topped out measures convey the same meaning of relative quality performance as the highest values for measures that are not topped out. In other words, we did not believe that eligible clinicians electing to report topped out process measures should be able to receive the same maximum score as eligible clinicians electing to report preferred measures, such as outcome measures.

Therefore, we proposed to modify the benchmark methodology for topped out measures. Rather than assigning up to 10 points per measure, we proposed to limit the maximum number of

---

<sup>22</sup> The 5 percent of MIPS eligible clinicians with the highest scores, and the 5 percent with lowest scores are removed before calculating the Coefficient of Variation.

<sup>23</sup> This is a test of whether the range of scores in the upper quartile is statistically meaningful.

<sup>24</sup> This last criterion is in addition to the HVBP definition.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

points a topped out measure can achieve based on how clustered the scores are. We proposed to identify clusters within topped out measures and would assign all MIPS eligible clinicians within the cluster the same value, which would be the number of points available at the midpoint of the cluster. That is, we proposed to take the midpoint of the highest and lowest scores that would pertain if the measure was not topped out and the values were not clustered. We proposed to only apply this methodology for benchmarks based on the baseline period. When we develop the benchmarks, we would identify the clusters and state the points that would be assigned when the measure performance rate is in a cluster. We proposed to notify MIPS eligible clinicians when those benchmarks are published with regard to which measures are topped out.

We proposed this approach because we wanted to encourage MIPS eligible clinicians not to report topped out measures, but to instead choose other measures that are more meaningful. We also sought feedback on alternative ways and an alternative scoring methodology to address topped out measures so that topped out measures do not disproportionately affect a MIPS eligible clinician's quality performance category score. Other alternatives could include placing a limit on the number of topped out measures MIPS eligible clinicians may submit or reducing the weight of topped out measures. We also considered whether we should apply a flat percentage in building the benchmarks, similar to the Shared Savings Program, where MIPS eligible clinicians are scored on their percentage of their performance rate and not on a decile distribution and requested comment on how to apply such a methodology without providing an incentive to report topped out measures. Under the Shared Savings Program, 42 CFR 425.502, there are circumstances when benchmarks are set using flat percentages. For some measures, benchmarks are set using flat percentages when the 60th percentile was equal to or greater than 80.00 percent, effective beginning with the 2014 reporting year (78 FR 74759–74763). For other measures benchmarks are set using flat percentages when the 90th percentile was equal to or greater than

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

95.00 percent, effective beginning in 2015 (79 FR 67925). Flat percentages allow those with high scores to earn maximum or near maximum quality points while allowing room for improvement and rewarding that improvement in subsequent years. Use of flat percentages also helps ensure those with high performance on a measure are not penalized as low performers. We also noted that we anticipate removing topped out measures over time, as we work to develop new quality measures that will eventually replace these topped out measures. We requested feedback on these proposals.

The following is a summary of the comments we received regarding our proposal to assign points based on achievement.

Comment: Many commenters supported the use of the decile scoring method for non-topped-out measures, including the partial point allocation, but some cautioned that without stronger clarification, the scoring complexity would create considerable confusion among MIPS eligible clinicians. One commenter wanted to know how CMS would capture partial credit in the quality performance category. The commenter also wanted to know if there is a standardized grading scale used to determine where a clinician/practice might fall between 0-10 points.

Response: We appreciate the support for the decile scoring. We are finalizing the decile scoring method for assigning points, but for the transition year, we are also adding a 3-point floor for all submitted measures, as well as for the readmission measure (if the readmission measure is applicable). This means that MIPS eligible clinicians will receive between 3 and 10 points per reported measure. We note that this scoring method allows partial credit because the MIPS eligible clinician can still achieve points even if the MIPS eligible clinician does not submit all the required measures. For example, if the MIPS eligible clinician has six applicable measures yet only submits two measures, then we will score the two submitted measures. However, the MIPS eligible clinician will receive a 0 for every required measure that is not submitted.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: A few commenters requested that CMS not use quality-tiering in MIPS given that regardless of the investment in quality, most MIPS eligible clinicians will receive an average score.

Response: We are not using the quality-tiering methodology in MIPS. We are shifting to the decile scoring system, and, unlike quality tiering, we expect performance to be along a continuum.

Comment: Other commenters were concerned about the scoring criteria, which they believed would not offer guaranteed success just for reporting. Commenters stated that benchmarks and performance standards remain undefined and return on investment is uncertain and requested that CMS revise the quality scoring so that half of the quality score is granted to any practice that just attempts to report.

Response: We would like to note that MACRA requires us to measure performance, not reporting. During this transition year, though, we believe it is important for MIPS eligible clinicians to learn to participate in MIPS, be rewarded for good performance, and be protected from being unfairly subjected to negative payment adjustments. Therefore, in addition to scoring measures on performance, we will give at least 3 points for each quality measure that is submitted under MIPS, as well as for the readmission measure (if the readmission measure is applicable). With the lowered performance threshold described in section II.E.7.c. of this final rule with comment period, this will ensure that MIPS eligible clinicians that submit quality data will receive at least a neutral payment adjustment or a small positive payment adjustment.

Comment: A few commenters did not support the decile approach. One commenter proposed that CMS model quality scoring on the advancing care information performance category scoring with a target point total and the ability to exceed that total, and another commenter recommended using flat percentages. One commenter opposed using percentiles,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

deciles or any other rank-based statistics for performance ranking used for payment adjustments because it does not generate information on statistically significant performance at either end of the performance spectrum and hides real differences that could lead to effective quality improvement. The commenter also believed the proposed approach will always penalize a certain proportion of clinicians. This commenter recommended a methodology which uses some basis of statistical significance or classification based on the underlying spread of the distribution.

Response: All scoring systems have limitations, but we believe the proposed scoring system is appropriate for MIPS. For measures for which there is baseline data, our scoring system bases the benchmarks on this data. This structure aligns with the HVBP and creates benchmarks that are achievable. In addition, we were striving for simplicity, and we believe that comparison to these benchmarks is well aligned. This approach brings attention to measure performance and focuses on quality improvement. We did not propose the flat percentage option as not all measures are structured as a percentage. Finally, we elected not to base the benchmark distribution on statistical significance because those methods can be more difficult to explain, monitor and track. We note also that relative performance is embedded in the MIPS payment adjustment, which is applied to the final score on a linear scale. We are finalizing at §414.1380(b)(1)(ix) to score performance using a percentile distribution, separated by decile categories.

Comment: One commenter encouraged CMS to incorporate health equity into a clinician's quality achievement score in future years.

Response: We will consider this feedback in future rulemaking.

Comment: On commenter requested clarification on how the CAHPS for MIPS survey would be scored. The commenter asked if CMS intended to create a single CAHPS for MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

overall mean score roll-up or if CMS would score each summary survey measure (SSM)

individually to create a CAHPS for MIPS average score.

Response: Each SSM will have an individual benchmark. We will score each SSM individually and compare it against the benchmark to establish the number of points. The CAHPS score will be the average number of points across SSMs.

Comment: Many commenters supported retaining topped out measures and allowing topped out measures to be awarded the maximum number of points. Commenters emphasized that topped out measures allow more specialties to report and that the proposed lower point assignment to topped out measures put clinicians that have limited ability to report and track performance over time at a distinct disadvantage. For this reason, commenters recommended awarding equal points for topped out and non-topped out measures by maintaining the 10-point maximum value, at least in the transition year. Commenters also cited a lack of transparency in how topped out measures are identified, the existing complexity in the quality scoring approach, the fact that measures that are recognized as topped out nationally might not be topped out regionally or locally, and a belief that topped out measures are only reported by a small percentage of eligible physicians for any particular measure. Commenters recommend not removing topped out measures for at least 3 years since it takes that timeframe for new measures to be developed to replace topped out measures and because some topped out measures are critical to clinical care; however, other commenters recommended removing topped out measures since such measures will not appropriately reward high performance. Another commenter requested a year's notice prior to removal.

Response: We agree that MIPS eligible clinicians should understand which measures are topped out. Therefore, we are not going to modify scoring for topped out measures until the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

second year the measure has been identified as topped out. The first year that any measure can be identified as topped out is the transition year, that is, the CY 2017 performance period. Thus, we will not modify the benchmark methodology for any topped out measures for the CY 2017 performance period. We will modify the benchmark methodology for topped out measures beginning with the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. We seek comment on whether, for the second year a measure is topped out, to use a mid-cluster scoring approach, flat rate percentage approach or to remove topped out measures at this time.

Comment: Some commenters recommended that if topped out measures are to be scored differently, we should use the Shared Savings Program approach, not the Hospital VBP approach. One commenter suggested that CMS review these measures after the first performance period to re-evaluate topped out designations. One commenter noted that the methodology for distinguishing topped out measures is flawed since a narrow performance gap only means that performance is high for the cohort of reporting providers and does not reflect the performance of the rest of the population to whom the measure may be applicable. This commenter stated that many of the measures CMS that had deemed topped out were not implemented in PQRS long enough for robust data to have been collected to confirm that designation and thus requested that CMS remove the topped out designation.

Response: As noted above, we are not creating a separate scoring system for topped out measures until the second year that the measure has been identified as topped out based on the baseline quality scores (for example, 2015 performance for the 2017 performance year). Our methodology for selecting topped out measures uses all information available to us. Because we offer the flexibility for most MIPS eligible clinicians to select the measures most relevant to their practice, we generally cannot assess the performance of clinicians on measures that the clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

do not elect to submit. However, we can assess the performance of clinicians for the readmission measure which is not submitted but which is calculated from administrative claims data. We note that we are not removing topped out measures and that the designation can change if data collection practices and results change. We recognize that the MIPS scoring algorithm may not work as well for topped out measures; however, for the transition year, we have added protections in place to ensure that MIPS eligible clinicians who report at least one quality measure are protected from being unfairly subjected to a negative adjustment. We also intend to reduce the number of topped out measures in MIPS in future years.

Comment: Commenters requested more transparency in how topped out measures were identified and stressed the importance of identifying topped out measures and the benchmarks for each of before finalizing a separate scoring system for such measures. Some commenters recommended listing them in the final rule with comment period, defining the rationale for maintaining them, and that if advance notice is not possible, topped out measure points should not be reduced. One commenter recommended that we allow the public to provide feedback before designating a measure as topped out to explain why it might appear as such. Another commenter noted that insufficient data is available to determine whether a measure is truly topped out or whether only high performers might have chosen to report a given measure.

Response: We agree that MIPS eligible clinicians should understand which measures are topped out. We will take these comments into consideration for future rulemaking. As discussed above, we are not going to modify scoring for topped out measures until the second year the measure has been identified as topped out.

We plan to identify topped out measures for benchmarks based on the baseline period when we post the detailed measures specifications and the measure benchmarks prior to the start of the performance period. This will count as the first year a measure is identified as topped out.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The second year the same measure is topped out, we will apply a topped out measure scoring standard beginning in performance periods occurring in 2018. We note as reflected above we are seeking comment on the topped out measure scoring standard. We also plan to identify topped out measures for benchmarks based on the performance period.

Comment: Most commenters recommended not limiting the number of topped out measures clinicians can submit, with one commenter asking for clarification on whether reporting additional topped out measures would allow a clinician to reach the maximum quality performance category score. Another commenter supported limiting MIPS eligible clinicians to reporting no more than two topped out measures to avoid potential “gaming”.

Response: For the transition year of MIPS, we are not going to limit the number of topped out measures a clinician can submit. Thus, reporting topped out measures could potentially allow a clinician to reach the maximum quality performance category score since the MIPS eligible clinician could receive 10 points for each topped out measure submitted. We will continue to monitor and evaluate the impact of topped out measures and should we deem it necessary, we would propose a limitation of how many topped out measures could be reported through future rulemaking.

Comment: One commenter recommended that CMS reweight topped out measures so as not to impose an unavoidable penalty on specialists. Another commenter suggested CMS re-evaluate and consider expanding its criteria for topped out measures to ensure clinicians’ relative quality performance is fairly and accurately tied to payment, while still ensuring that specialists have a sufficient number of measures to select from under MIPS.

Response: We share the concerns that topped out measures may disproportionately affect different specialties. We plan to publicly post which measures are topped out so that commenters will be able to plan accordingly. In addition, for the transition year of MIPS, we are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not modifying the scoring for topped out measures. Instead, scoring for topped out measures will be the same as scoring for all other measures. We will continue to monitor and evaluate the impact of topped out measures by various MIPS eligible clinician practice characteristics. We will propose any additional policy changes through future rulemaking. Further, we encourage stakeholders to create new measures that can be used in the MIPS program to replace any topped out measures.

Comment: One commenter recommended removing topped out measures from the CMS Web Interface measures.

Response: We are not proposing to remove topped out measures for MIPS in the transition year, and we do not believe it would be appropriate to remove topped out measures from the CMS Web Interface. The CMS Web Interface measures are used in MIPS and in APMs such as the Shared Savings Program. We have aligned policies where possible, including using the Shared Savings Program benchmarks for the CMS Web Interface measures. We believe any modifications to the CMS Web Interface measures should be coordinated with Shared Savings Program and go through rulemaking.

Comment: One commenter was concerned about our comment in the proposed rule that approximately half of the MIPS quality measures are topped out and that several have a median score of 100 percent.

Response: We share the commenter's concerns that so many measures are topped out and show little variation in performance. It is unclear if this result is truly due to lack of variation in performance or clinicians are only submitting measures for which they have a good performance. We believe that MIPS eligible clinicians generally should have the flexibility to select measures most relevant to their practice, but one trade-off is not all MIPS eligible clinicians are reporting the same measure. Because removing such a large volume of measures would make it difficult

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for some specialties to have enough applicable measures to submit, we are not removing these measures from MIPS. As discussed above, we will identify these measures for year 1, but we will not modify the scoring of topped out measures until the second year they have been identified.

Comment: One commenter recommended that CMS identify topped out measures as measures with a median performance rate over 95 percent because the definition is easier to understand. Another commenter requested further clarification on the definition of topped out measures.

Response: We agree that, for process measures that are scored between 0 and 100 percent, using a median greater than 95 percent is a simple way to identify topped out measures. For process measures, we are modifying our proposal to identify topped out measures as those with a median performance rate of 95 percent or higher. For other measures, we are finalizing our proposal to identify topped out measures by using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors.

Comment: One commenter recommended that CMS use historical data to analyze whether allowing clinicians to choose an unrestricted combination of six quality measures out of hundreds of measures would lead to a topped out effect among final scores, and to devise an alternative MIPS measure selection methodology should it find that average final scores are universally inflated. Commenter also recommended that CMS remove topped out measures from the list of quality measures that MIPS eligible clinicians have to choose from, as measures that generate universally high performance scores fail to appropriately reward performance with higher payment.

Response: We plan to continue evaluating the impact of topped out measures in the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS program. Because removing such a large volume of measures would make it difficult for some specialties to have enough applicable measures to report, we are not removing these measures from MIPS in year 1. As discussed above, we will identify these measures for year 1, but we will not modify the scoring of topped out measures until the second year they have been identified.

After consideration of the comments, we are not finalizing all of our policies as proposed.

We are establishing that the performance standard with respect to the quality performance category is measure-specific benchmarks. Specifically, we are finalizing at §414.1380(b)(1) that, for the 2017 performance period, MIPS eligible clinicians receive three to ten achievement points for each scored quality measure in the quality performance category based on the MIPS eligible clinician's performance compared to measure benchmarks. A MIPS quality measure must have a measure benchmark to be scored based on performance. MIPS quality measures that do not have a benchmark will not be scored based on performance. Instead, these measures will receive 3 points for the 2017 performance period.

We are finalizing at §414.1380(b)(1)(ix), that measures submitted by MIPS eligible clinicians are scored using a percentile distribution, separated by decile categories. As discussed below, for MIPS payment year 2019, topped out quality measures are not scored differently than quality measures that are not considered topped out. At §414.1380(b)(1)(x), we finalize that for each set of benchmarks, CMS calculates the decile breaks for measure performance and assigns points based on which benchmark decile range the MIPS eligible clinician's measure rate is between. At §414.1380(b)(1)(xi) we assign partial points based on the percentile distribution. In §414.1380(b)(xii) MIPS eligible clinicians are required to submit measures consistent with §414.1335.

Based on public comments, we are finalizing a modification to our proposal for the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

benchmark methodology for topped out measures. Specifically, we will not modify the benchmark methodology for topped out measures for the first year that the measure has been identified as topped out. Rather, for the first year the measure has been identified as topped out we will score topped out measures in the same manner as other measures until the second year the measure has been identified as topped out. The first year that any measure can be identified as topped out is the transition year, that is, the CY 2017 performance period. Thus, we will not modify the benchmark methodology for any topped out measures for the CY 2017 performance period. We will modify the benchmark methodology for topped out measures beginning with the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. We seek comment on how topped out measures would be scored provided that it is the second year the measure has been identified as topped out. One option would be to score the measures using a mid-cluster approach. Under this approach, beginning with the CY 2018 performance period, we would limit the maximum number of points a topped out measure can achieve based on how clustered the scores are. We would identify clusters within topped out measures and assign all MIPS eligible clinicians within the cluster the same value, which will be the number of points available at the midpoint of the cluster. That is, we would take the midpoint of the highest and lowest scores that would pertain if the measure were not topped out and the values were not clustered. We would only apply this methodology for measures with benchmarks based on the baseline period. When we develop the benchmarks, we would identify the clusters and state the points that would be assigned when the measure performance rate is in a cluster. We would notify MIPS eligible clinicians when those benchmarks are published with regard to which measures are topped out. Another approach would be to remove topped out measures in the CY 2018 performance period, provided that it is the second year the measure has been identified as topped out. In this instance, we would not score these measures. Finally, a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

third approach would be to apply a flat percentage in building the benchmarks for topped out measures, similar to the Shared Savings Program, where MIPS eligible clinicians are scored on the performance rate rather than their place in the performance rate distribution. We request comment on how to apply such a methodology without providing an incentive to report topped out measures. Under the Shared Savings Program, 42 CFR 425.502, there are circumstances when benchmarks are set using flat percentages. For some measures, benchmarks are set using flat percentages when the 60th percentile was equal to or greater than 80.00 percent, effective beginning with the 2014 reporting year (78 FR 74759–74763). For other measures benchmarks are set using flat percentages when the 90th percentile was equal to or greater than 95.00 percent, effective beginning in 2015 (79 FR 67925). Flat percentages allow those with high scores to earn maximum or near maximum quality points while allowing room for improvement and rewarding that improvement in subsequent years. Use of flat percentages also helps ensure those with high performance on a measure are not penalized as low performers. We seek comment on each of these three options. Finally, we also note that we anticipate removing topped out measures over time, as we work to develop new quality measures that will eventually replace these topped out measures. We seek comment on at what point in time should measures that are topped out be removed from the MIPS.

We are modifying our proposed approach to identify topped out measures. We had proposed to identify all topped out measures by using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation<sup>25</sup> is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors;<sup>26</sup> or median value for a process measure that is

---

<sup>25</sup> The 5 percent of MIPS eligible clinicians with the highest scores, and the 5 percent with lowest scores are removed before calculating the Coefficient of Variation.

<sup>26</sup> This is a test of whether the range of scores in the upper quartile is statistically meaningful.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

95 percent or greater (80 FR 49550).<sup>27</sup> However, for process measures, we are defining at §414.1305 topped out process measures as those with a median performance rate of 95 percent or higher. For other measures, we are defining at §414.1305 topped out non-process measures using a definition similar to the definition used in the Hospital VBP Program: Truncated Coefficient of Variation is less than 0.10 and the 75th and 90th percentiles are within 2 standard errors.

In addition, as discussed in section II.E.6.a.(2)(a) of this final rule with comment period, we will add a global 3-point floor for all submitted measures for the transition year by assigning the decile breaks for measure performance between 3 and 10 points. We will revisit this policy in future years. Adding this floor responds to public comments for protections against being unfairly penalized for low performance. Table 16 in section II.E.6.a.(2)(a) illustrates an example of using decile points along with the addition of the 3-point floor to assign achievement points for a sample quality measure. The methodology in this example could apply to measures where the benchmark is based on the baseline period or for new measures where the benchmark is based on the performance period, assuming the measures meet the case minimum requirements and have a benchmark. We will continue to apply the new measure 3-point floor for measures without baseline period benchmarks for performance years after the first transition year. As discussed in section II.E.6.a.(2)(g)(ii) of this final rule with comment period, CMS Web Interface measures below the 30<sup>th</sup> percentile will be assigned a value of 3 points during the transition year to be consistent with other submission mechanisms. For the transition year, the 3-point floor will apply for all submitted measures regardless of whether they meet the case minimum requirements or have a benchmark, with the exception of measures submitted through the CMS Web Interface, which must still meet the case minimum requirements and have a benchmark in

---

<sup>27</sup> This last criterion is in addition to the HVBP definition.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

order to be scored. All submitted measures, regardless of submission mechanism, must meet the case minimum requirements, data completeness requirements, and have a benchmark in order to be awarded more than 3 points. We will revisit this policy in future years.

We provide some examples below of the total possible points that MIPS eligible clinicians could receive under the quality performance category under our revised methodology. As described in section II.E.5.b. of this rule, MIPS eligible clinicians are required to submit six measures or measures from a specialty measure set, and we would also score MIPS eligible clinicians on the all-cause hospital readmission measure for groups of 16 or more with sufficient case volume (200 cases). The total possible points for the quality performance category would be 70 points for groups of 16 or more clinicians (6 submitted measures x 10 points + 1 all-cause hospital readmission measure x 10 points =70). Further, the total possible points for small practices of 15 or fewer clinicians and solo practitioners and MIPS individual reporters (or for groups with less than 200 cases for the readmission measure) would be 60 points (6 submitted measures x 10 points =60) because the all-cause hospital readmissions measure would not be applicable.

However, for groups reporting via CMS Web Interface and that have sufficient case volume for the readmission measure, the total possible points for the quality performance category would vary between 120-150 points as discussed in Table 24 in section II.E.6.a.(2)(g)(ii) of this rule. If all measures are reported, then the total possible points is 120 points: (11 measures x 10 points) + (1 all-cause hospital readmission measures x 10 points) = 120; for those groups with sufficient case volume (200 cases) to be measured on readmissions. We discuss in section II.E.6.a.(2)(g)(ii) why the total possible points vary based on whether measures without a benchmark are reported. For other CMS Web Interface groups without sufficient volume for the readmissions measure, the readmission measure will not be scored, and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the total possible points for the quality performance category would vary between 110-140 points, instead of 120-150 as discussed in section II.E.6.a.(2)(g)(ii).

(c) Case Minimum Requirements and Measure Reliability and Validity

We seek to ensure that MIPS eligible clinicians are measured reliably; therefore, we proposed at §414.1380(b)(1)(iv) to use for the quality performance category measures the case minimum requirements for the quality measures used in the 2018 VM (see §414.1265): 20 cases for all quality measures, with the exception of the all-cause hospital readmissions measure, which has a minimum of 200 cases. We referred readers to Table 46 of the CY 2016 PFS final rule (80 FR 71282), which summarized our analysis of the reliability of certain claims-based measures used for the 2016 VM payment adjustment. MIPS eligible clinicians that report measures with fewer than 20 cases (and the measure meets the data completeness criteria) would receive recognition for submitting the measure, but the measure would not be included for MIPS quality performance category scoring. Since the all-cause hospital readmissions measure does not meet the threshold for what we consider to be moderate reliability for solo practitioners and groups of less than ten MIPS eligible clinicians for purposes of the VM (see Table 46 of the CY 2016 PFS final rule, referenced above), for consistency, we proposed to not include the all-cause hospital readmissions measure in the calculation of the quality performance category for MIPS eligible clinicians who individually report, as well as solo practitioners or groups of two to nine MIPS eligible clinicians.

We also proposed that if we identify issues or circumstances that would impact the reliability or validity of a measure score, we would also exclude those measures from scoring. For example, if we discover that there was an unforeseen data collection issue that would affect the integrity of the measure information, we would not include that measure in the quality performance category score. If a measure is excluded, we would recognize that the measure had

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

been submitted and would not disadvantage the MIPS eligible clinicians by assigning them zero points for a non-reported measure.

The following is a summary of the comments we received regarding our proposal to score measures with minimum case volume and validity.

Comment: Several commenters were generally supportive of the 20 case minimum requirement.

Response: We appreciate the support from these commenters and are finalizing our proposed approach of the 20 case minimum requirement for all measures except the all-cause hospital readmission measure. We are keeping the 200 case minimum for the all-cause readmission measure; however, as we are defining small groups as those with 15 or fewer clinicians, we are revising our proposal to not apply the readmission measure to solo practices or to groups with 2-9 clinicians. Rather, for consistency, we will not apply the readmission measure to solo practices or small groups (groups with 15 or fewer clinicians) or MIPS individual reporters.

Comment: One commenter noted that clinicians attempting to participate, even if they are unable to meet the minimum case requirements, should still be acknowledged for making the attempt, especially if they are showing year-over-year improvement.

Response: We agree that MIPS eligible clinicians should receive acknowledgement for participating; however, we also have to balance this with the ability to accurately measure performance. For the transition year, we are modifying our proposed approach on how we will score submitted measures that are unreliable because, for example, they are below the case minimum requirements. These measures will not be scored based on performance against a benchmark, but will receive an automatic score of three points. We believe this policy will simplify quality scoring in that it ensures that every clinician that submits quality data will

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

receive a quality score. This is particularly important in the transition year because with a minimum 90-day performance period, we anticipate more MIPS eligible clinicians will submit measures below the case minimum requirements. We selected three points because we did not want to provide more credit for reporting a measure that cannot be reliably scored against a benchmark than for measures for which we can measure performance against a benchmark. In Table 17, we summarize two classes of measures: “class 1” are those measures for which performance can be reliably scored against a benchmark, and “class 2” are measures for which performance cannot be reliably scored against a benchmark. Additionally, we seek comment on whether we should remove non-outcomes measures for which performance cannot reliably be scored against a benchmark (for example, measures that do not have 20 reporters with 20 cases that meet the data completeness standard) for 3 years in a row. We believe it would be appropriate to remove outcomes measures under a separate timeline as we expect reporting of such measures to increase more slowly; further, we want to encourage the availability of outcomes measures.

Comment: One commenter wanted to know whether a MIPS eligible clinician will receive credit for reporting a measure even if the MIPS eligible clinician’s measure data indicates that the measure activity was never performed. Another commenter supported the proposal to allow MIPS eligible clinicians to receive credit for any measures that they report, regardless of whether the MIPS eligible clinician meets the quality performance category submission criteria.

Response: As summarized in Table 17, for the transition year, measures that are submitted with a 0 percent performance rate (indicating that the measure activity was never performed) will receive 3 points. Measures that are below the case minimum requirement, or lack a benchmark (as discussed in section II.E.6.a (2)(a) or do not meet the data completeness

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

requirements will also receive 3 points. However, we acknowledge that these policies do not reflect our goals for MIPS eligible clinicians' performance under this program. Rather, we aim for complete and accurate reporting that reflects meaningful efforts to improve the quality of care patients receive; we do not believe that a 0 percent performance rate or reporting of measures that do not meet data completeness requirements achieves that aim. As such, we intend to revisit these policies and apply more rigorous standards moving forward. We will revisit these policies in future years.

Comment: One commenter requested that CMS ensure that all claims measures meet a reliability threshold of 0.80 at the individual physician level.

Response: We believe that measures with a reliability of 0.4 with a minimum attributed case size of 20 meet the standards for being included as quality measures within the MIPS program. We aim to measure quality performance for as many clinicians as possible, and limiting measures to reliability of 0.7 or 0.8 would result in fewer individual clinicians with quality performance category measures. In addition, a 0.4 reliability threshold ensures moderate reliability for most MIPS eligible clinicians or group practices that are being measured on quality.

Comment: One commenter also opposed limiting the number of measures that MIPS eligible clinicians can submit that are not able to be scored due to not meeting the required case minimum, since certain specialties may not have sufficient measures to report due to the few that are applicable and available to them.

Response: We will not be limiting the number of measures that MIPS eligible clinicians can submit that are below the case minimum requirement in the transition year. We may revisit this approach in future years.

Comment: One commenter recommended that CMS finalize the proposal whereby

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

physicians are not penalized in scoring when they report measures but do not have the required case minimum.

Response: We are modifying our proposed approach. Under our proposed approach, measures that were below the case minimum requirement, would have not been scored. Our revised approach is that, for the transition year, measures that do not meet the case minimum requirement, lack a benchmark or do not meet the data completeness criteria will not be scored and instead, MIPS eligible clinicians will receive 3 points for submitting the measure.

After consideration of the comments, we are finalizing case minimum policies for measures at §414.1380(b)(1)(iv) and §414.1380(b)(1)(v). For the quality performance category measures, we will use the following case minimum requirements: 20 cases for all quality measures, with the exception of the all-cause hospital readmissions measure, which has a minimum of 200 cases. We reiterate that we will only apply the all-cause readmission measure to groups of 16 or more MIPS eligible clinicians that meet the case minimum requirement.

Based on public comments, we are revising our proposed policy for all measures, except CMS Web Interface measures and administrative claims-based measures, that are submitted but for which performance cannot be reliably measured because the measures do not meet the required case minimum, do not have a benchmark, or do not meet the data completeness requirement, benchmark or is below the data completeness requirement, it will receive a floor of 3 points. At §414.1380(b)(1)(vii), for the transition year, we finalize that if the measure is submitted but is unable to be scored because it does not meet the required case minimum, does not have a benchmark, or does not meet the data completeness requirement, the measure will receive a score of 3 points.

We are finalizing our proposed policy for CMS Web Interface measures that are submitted but for which performance cannot be reliably measured because the measures do not

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

meet the required case minimum or do not have a benchmark. At §414.1380(b)(1)(viii), we are finalizing that the MIPS eligible clinician will receive recognition for submitting such measures, but the measure will not be included for MIPS quality performance category scoring. CMS Web Interface measures that do not meet the data completeness requirement will receive a score of 0. We are also finalizing our proposed policy for administrative claims-based measures for which performance cannot be reliably measured because the measures do not meet the required case minimum or do not have a benchmark. For the transition year, this policy would only apply to the readmission measure since the only administrative claims-based quality measure is the readmission measure. However, this policy will apply to additional administrative claims-based measures that are added in future years. At §414.1380(b)(1)(viii), we are finalizing that such measures will not be included in the MIPS eligible clinician’s quality performance category score. We note that the data completeness requirement does not apply to administrative claims-based measures. Overall, at §414.1380, we will provide points for all submitted measures, but only a subset of measures receive points based on performance against a benchmark. Table 17 summarizes our scoring rules and identifies two classes of measures for scoring purposes.<sup>28</sup>

**TABLE 17: Quality Performance Category: Scoring Measures Based on Performance for Performance Period 2017**

Measure Type	Description	Scoring Rules
Class 1 – Measure can be scored based on performance	Measures that were submitted or calculated that met the following criteria: 1) The measure has a benchmark <sup>29</sup> ; 2) Has at least 20 cases; and 3) Meets the data completeness standard (generally 50 percent.)	<ul style="list-style-type: none"> <li>• Receive 3 to 10 points based on performance compared to the benchmark.</li> </ul>
Class 2 – Measure cannot be scored based on performance and is instead assigned a 3-point score.	Measures that were submitted, but fail to meet one of the class 1 criteria. Measures either 1) Do not have a benchmark, 2) Do not have at least 20 cases, or 3) Measure does not meet data	<ul style="list-style-type: none"> <li>• Receive 3 points</li> <li>• Note: This Class 2 measure policy does not apply to CMS Web Interface measures and administrative</li> </ul>

<sup>28</sup> We classified the measures for simplicity in discussing results. Name of classification subject to change.

<sup>29</sup> Benchmarks needed 20 reporters with at least 20 cases meet data completeness and performance greater than 0 percent.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

	completeness criteria.	claims-based measures.
--	------------------------	------------------------

Generally, if we identify issues or circumstances that impact the reliability or validity of a class 1 measure score, we will recognize that the measure was submitted, but exclude that measure from scoring. Instead, MIPS eligible clinicians will receive a flat 3 points for submitting the measure. However, if we identify issues or circumstances that impact the reliability or validity of a class 1 measure that is a CMS Web Interface or administrative claims-based measure, we will exclude the measure from scoring. For Web Interface measures, we will recognize that the measure had been submitted. For Web Interface measures, as discussed in section II.E.6.a.(2)(g)(ii) of the final rule with comment period, and administrative claims-based measures, we will not score these measures. For the transition year, we note that the readmission measure is the only administrative claims-based quality measure. However, this policy will apply to additional administrative claims-based measures that are added in future years.

We provide below examples of our new scoring approach. For simplicity, the examples not only explain how to calculate the quality performance category score, but also how the quality performance category score contributes to the final score as described in section II.E.6.b of this final rule with comment period, assuming a quality performance category weight of 60 percent. We use the term weighted score to represent a performance category score that is adjusted for the performance category weight.

If the MIPS eligible clinician, as a solo practitioner, scored 10 out of 10 on each of five measures submitted, one of which was an outcome measure, and had one measure that was below the required case minimum, the MIPS eligible clinician would receive the following weighted score for the quality performance category: (5 measures X 10 points) + (1 measure X 3 points) or 53 out of 60 possible points X 60 (weight of quality performance category) = 53 points

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

toward the final score. Similarly, if the MIPS eligible clinician, as a solo practitioner, scored 10 out of 10 on each of five measures submitted, one of which was an outcome measure, but failed to submit a sixth measure even though there were applicable measures that could have been submitted, the MIPS eligible clinician would receive the following weighted score in the quality performance category:  $(5 \text{ measures} \times 10 \text{ points}) + (1 \text{ measure} \times 0 \text{ points})$  or 50 out of 60 possible points  $\times 60$  (weight of quality performance category) = 50 points toward the final score.

We also provide examples of instances where MIPS eligible clinicians either do not have 6 applicable measures or the applicable specialty set has less than six measures.

For example, if a specialty set only has 3 measures or if a MIPS eligible clinician only has 3 applicable measures, then, in both instances, the total possible points for the MIPS eligible clinician is 30 points  $(3 \text{ measures} \times 10 \text{ points})$ . If the MIPS eligible clinician scored 8 points on each of the 3 applicable measures submitted, one of which was an outcome measure, then the MIPS eligible clinician would receive the following weighted score in the quality performance category:  $(3 \text{ measures} \times 8 \text{ points})$  or 24 out of 30 possible points  $\times 60$  (weight of quality performance category) = 48 points toward the final score.

#### (d) Scoring for MIPS Eligible Clinicians that Do Not Meet Quality Performance Category Criteria

Section II.E.5.b. of the proposed rule outlined our proposed quality performance category criteria for the different reporting mechanisms. The criteria vary by reporting mechanism, but generally we proposed to include a minimum of six measures with at least one cross-cutting measure (for patient facing MIPS eligible clinicians) (Table C of the proposed rule at 81 FR 28447) and an outcome measure if available. If an outcome measure is not available, then we proposed that the eligible clinician would report one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures) in lieu of an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

outcome measure. We proposed that MIPS eligible clinicians and groups would have to select their measures from either the list of all MIPS Measures in Table A of the Appendix in the proposed rule (81 FR 28399) or a set of specialty specific measures in Table E of the Appendix in the proposed rule (81 FR 28460). As discussed in section II.E.5.b.(3) of this final rule with comment period, we are not finalizing the requirement for a cross-cutting measure. As discussed in II.E.5.b.(6) of this final rule with comment period, we are also not including two of the three population measures in the scoring.

We noted that there are some special scenarios for those MIPS eligible clinicians who select their measures from the Specialty Sets (Table E of the Appendix in the proposed rule at 81 FR 28460) as discussed in section II.E.5.b. of the proposed rule (81 FR 28186).

For groups using the CMS Web Interface and MIPS APMs, we proposed to have different quality performance category criteria described in sections II.E.5.b. and II.E.5.h. of the proposed rule (81 FR 28187 and 81 FR 28234). Additionally, as described in section II.E.5.b of the proposed rule, we also proposed to score MIPS eligible clinicians on up to three population-based measures.

Previously in PQRS, EPs had to meet all the criteria or be subject to a negative payment adjustment. However, we proposed that MIPS eligible clinicians receive credit for measures that they report, regardless of whether or not the MIPS eligible clinician meets the quality performance category submission criteria. Section 1848(q)(5)(B)(i) of the Act provides that under the MIPS scoring methodology, MIPS eligible clinicians who fail to report on an applicable measure or activity that is required to be reported shall be treated as receiving the lowest possible score for the measure or activity; therefore, for any MIPS eligible clinician who does not report a measure required to satisfy the quality performance category submission criteria, we proposed that the MIPS eligible clinician would receive zero points for that measure.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

For example, a MIPS eligible clinician who is able to report on six measures, yet reports on four measures, would receive two “zero” scores for the missing measures. However, we proposed that MIPS eligible clinicians who report a measure that does not meet the required case minimum would not be scored on the measure but would also not receive a “zero” score.

We also noted that if MIPS eligible clinicians are able to submit measures that can be scored, we want to discourage them from continuing to submit the same measures year after year that cannot be scored due to not meeting the required case minimum. Rather, to the fullest extent possible, MIPS eligible clinicians should select measures that would meet the required case minimum. We sought comment on any safeguards we should implement in future years to minimize any gaming attempts. For example, if the measures that a MIPS eligible clinician submits for a performance period are not able to be scored due to not meeting the required case minimum, we sought comment on whether we should require these MIPS eligible clinicians to submit different measures with sufficient cases for the next performance period (to the extent other measures are applicable and available to them).

We proposed that MIPS eligible clinicians who report a measure where there is no benchmark due to less than 20 MIPS eligible clinicians reporting on the measure would not be scored on the measure but would also not receive a “zero” score. Instead, these MIPS eligible clinicians would be scored according to the following example: a MIPS eligible clinician who submits six measures through a group of 10 or more clinicians, with one measure lacking a benchmark, would be scored on the five remaining measures and the three population-based measures based on administrative claims data

We stated our intent to develop a validation process to review and validate a MIPS eligible clinician’s inability to report on the quality performance requirements as proposed in section II.E.5.b. of the proposed rule. We anticipate that this process would function similar to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the Measure Applicability Validity (MAV) process that occurred under PQRS, with a few exceptions. First, the MAV process under PQRS was a secondary process after an EP was determined to not be a satisfactory reporter. Under MIPS, we intend to build the process into our overall scoring approach to reduce confusion and burden on MIPS eligible clinicians by having a separate process. Second, as the requirements under PQRS are different than those proposed under MIPS, the process must be updated to account for different measures and different quality performance requirements. More information on the MAV process under PQRS can be found at [http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/PQRS/Downloads/2016\\_PQRS\\_MAV\\_ProcessforClaimsBasedReporting\\_030416.pdf](http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/PQRS/Downloads/2016_PQRS_MAV_ProcessforClaimsBasedReporting_030416.pdf). We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposal to score MIPS eligible clinicians that do not meet quality performance category criteria.

Comment: Commenters recommended that we clarify the proposed process to identify whether groups have fewer than 6 applicable measures to report and wanted real time notification of whether they passed. One commenter requested clarification on how proposed specialty sets will be scored, given that many have less than the required number of measures and do not include a required outcome or high priority measure. A few commenters recommended reinstating the MAV process. A few commenters recommended that CMS should engage the public in developing the MAV process and provide the public with a formal opportunity to provide input into proposed clusters and the overall MAV algorithm. One commenter recommended that CMS consider both the availability of measures based on subspecialty or patient condition and also submission mechanism. The commenter was concerned that due to the requirement to use only one submission mechanism per performance category, a MIPS eligible clinician or group may be prevented from achieving all measure

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

requirements. The commenter believed CMS should not penalize a clinician for failing to report a measure because it is unavailable via the submission mechanism selected. Another commenter requested that CMS compare the scores of primary care and specialty care clinicians and assess whether the difference is due to a lack of available measures.

Response: The MIPS validation process will vary by submission mechanism. For claims and registry submissions, we plan to use the cluster algorithms from the current MAV process under PQRS to identify which measures an MIPS eligible clinician is able to report. For QCDRs, we do not intend to establish a validation process. We expect MIPS eligible clinicians that enroll in QCDRs have sufficient meaningful measures that the MIPS eligible clinician is able to report. For the EHR submissions, we know that MIPS eligible clinicians may not have six measures relevant within their EHR. If there are not sufficient EHR measures to meet the full specialty set requirements or meet the requirement to submit 6 measures, the MIPS eligible clinician should select a different submission mechanism in order to meet the quality performance category requirements of submitting measures in a specialty set or six applicable measures. MIPS eligible clinicians should work with their EHR vendors to incorporate applicable measures as feasible. As discussed in section II.E.6.a.(1) of this final rule with comment period, if a MIPS eligible clinician submits via multiple mechanisms we would calculate two quality performance category scores and take the highest score. For the CMS Web Interface, MIPS eligible clinicians are attributed beneficiaries on a defined population that is appropriate for the measures, so there is no need for additional validation. Given the number of choices for submitting quality data, we anticipate MIPS eligible clinicians will be able to find a submission mechanism that meets the MIPS submission requirements. We strongly encourage MIPS eligible clinicians to select the submission mechanism that has 6 measures that are available and appropriate to their specialty and practice type.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Several commenters made recommendations on our request for comments on preventing gaming. Some commenters recommended an attestation or statement of explanation when a practice or provider chooses to submit a quality measure that does not meet the required case minimum. One commenter recommended that CMS require attestation from physicians who claim they are unable to report on quality performance requirements and that CMS provide very clear directions about the requirements in order to prevent confusion and inadvertent wrongdoing. Another commenter encouraged CMS to implement a strict validation and review process and to establish safeguards, such as a limit on the amount of measures that can be reported below the case minimum. One commenter requested clarification on whether CMS will allow clinicians to remain within their applicable measure set in such a scenario (that is, not force clinicians to report measures outside of their applicable measure set just to meet case minimum thresholds) and was concerned about the idea of prohibiting subsequent reporting on measures that did not meet case minimums. One commenter objected to our request for comments on how to prevent 'gaming' stating that for CMS to give such time and consideration to potential gaming of the system is insulting to America's physicians. The commenter believed that such focus on gaming leads to unnecessarily complicated programs. The commenter recommended that CMS acknowledge in the final rule with comment period that the vast majority of Medicare physicians are not intending to "game" the system or avoid meeting CMS program requirements and are instead attempting to learn about a new payment system that could go into effect in less than 6 months. The commenter also recommended that the resources currently earmarked for the purpose of identifying potential gaming should be directed towards helping MIPS eligible clinicians, from both large and small practices, understand the regulatory requirements, correctly report data, and identify areas and methods in which they can improve their scores.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: For the transition year, we are encouraging participation in MIPS and will not be finalizing any policies to prevent gaming. We agree with the commenter in that we believe the vast majority of MIPS eligible clinicians do not intend to game the system. Rather, we believe that clinicians are interested in working with us to learn the details of the new payment system established under the Quality Payment Program and to provide high quality care to Medicare beneficiaries. We must ensure, however, that payment under this new system is based on valid and accurate measurement and scoring, and identify ways to prevent any potential gaming that could occur in the program. We will continue to monitor MIPS eligible clinician submissions and may propose additional policies through future rulemaking as appropriate.

Comment: Commenters recommended that we hold EHR vendors accountable for EHR certification and measure availability and take this into account when scoring a MIPS eligible clinician on low case volume.

Response: We do currently require that EHR vendors be certified to a minimum of 9 eCQMs as is required for reporting under the current PQRS and EHR Incentive Programs. In the 2015 EHR Incentive Programs final rule, CMS required EPs, eligible hospitals, and CAHs to use the most recent version of an eCQM for electronic reporting beginning in 2017 (80 FR 62893). We are maintaining this policy for the electronic reporting bonus under MIPS and encourage MIPS eligible clinicians to work with their EHR vendors to ensure they have the most recent version of the eCQM. CMS will not accept an older version of an eCQM for a submission for the MIPS program for the quality category or the end-to-end electronic reporting bonus within that category. Additionally, measures that are submitted below the required case minimum will receive 3 points but will not be scored on performance for the 2017 performance period

After consideration of the comments, we are finalizing at §414.1380(b)(1)(vi) that MIPS eligible clinicians who fail to report a measure that is required to satisfy the quality performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

category submission criteria will receive zero points for that measure. Further, we are finalizing implementation of a validation process for claims and registry submissions to validate whether MIPS eligible clinicians have six applicable and available measures, whether an outcome measure is available or another other high priority measure if an outcome measure is not available.

However, we are not finalizing our proposal that MIPS eligible clinicians who report a measure that does not meet the required case minimum, the data completeness criteria, or for which there is no benchmark due to less than 20 MIPS eligible clinicians reporting the measure, would not receive any points for submission and would not be scored on performance against a benchmark. Rather, as discussed in section II.E.6.a.(2)(c) of this final rule with comment period, for “class 2” measure, as defined in Table 17, that are submitted, but unable to be scored, we will add a 3-point floor for all submitted measures for the transition year. That is, if a MIPS eligible clinician submits a “class 2” measure, as defined in Table 17 we will assign 3 points to the MIPS eligible clinician for submitting that measure regardless of whether the measure meets the data completeness requirement or required case minimum requirement or whether the measure has a benchmark for the transition year. For example, a MIPS eligible clinician who is a solo practitioner could submit 6 measures as follows: 2 measures (one of which is an outcome measure) with high performance, scoring 10 out of 10 on each of these measures, 1 measure that lacks minimum case size, 1 measure that lacks a benchmark, 1 measure that does not meet the data completeness requirement and 1 measure with low performance. In this case, the MIPS eligible clinician would receive 32 out of 60 possible points in the quality performance category (2 measures X 10 points plus 4 measures X 3 points). We will revisit this policy in future years.

(e) Incentives to Report High Priority Measures

Consistent with other CMS value-based payment programs, we proposed that MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

scoring policies would emphasize and focus on high priority measures that impact beneficiaries.

These high priority measures are defined as outcome, appropriate use, patient safety, efficiency, patient experience and care coordination measures; see Tables A through D of the Appendix in the proposed rule (81 FR 28399 - 28460) for these measures. We proposed these measures as high priority measures given their critical importance to our goals of meaningful measurement and our measure development plan. We note that many of these measures are grounded in NQS domains. For patient safety, efficiency, patient experience and care coordination measures, we refer to the measures within the respective NQS domains and measure types. For outcomes measures, we include both outcomes measures and intermediate outcomes measures. For appropriate use measures, we have noted which measures fall within this category in Tables A through D and provided criteria for how we identified these measures in section II.E.5.b. of the proposed rule. For non-MIPS measures reported through QCDRs, we proposed to classify which measures are high priority during the measure review process.

We proposed scoring adjustments to create incentives for MIPS eligible clinicians to submit high priority measures and to allow these measures to have more impact on the total quality performance category score.

We proposed to create an incentive for MIPS eligible clinicians to voluntarily report additional high priority measures. We proposed to provide 2 bonus points for each outcome and patient experience measure and 1 bonus point for other high priority measures reported in addition to the one high priority measure (an outcome measure, but if one is not available, then another high priority measure) that would already be required under the proposed quality performance category criteria. For example, if a MIPS eligible clinician submitted 2 outcome measures, and two patient safety measures, the MIPS eligible clinician would receive 2 bonus points for the second outcome measure reported and 2 bonus points for the two patient safety

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures. The MIPS eligible clinician would not receive any bonus points for the first outcome measure submitted since that is a required measure. We selected 2 bonus points for outcome measures given the statutory requirements under section 1848(q)(2)(C)(i) of the Act to emphasize outcome measures. We selected 2 bonus points for patient experience measures given the importance of patient experience measures to our measurement goals. We selected 1 bonus point for all other high priority measures given our measurement goals around each of those areas of measurement. We believe the number of bonus points provides extra credit for submitting the measure, yet would not mask poor performance on the measure. For example, a MIPS eligible clinician with poor performance receives only 3 points for performance for a particular high priority measure. The bonus points would increase the MIPS eligible clinician's points to 4 (or 5 if the measure is an outcome measure or patient experience measure), but that amount is far less than the 10 points a top performer would receive. We noted that population-based measures would not receive bonus points.

We noted that a MIPS eligible clinician who submits a high priority measure but had a performance rate of 0 percent would not receive any bonus points. MIPS eligible clinicians would only receive bonus points if the performance rate is greater than zero. Bonus points are also available for measures that are not scored (not included in the top 6 measures for the quality performance category score) as long as the measure has the required case minimum and data completeness. We believe these qualities would allow us to include the measure in future benchmark development.

Groups submitting data through the CMS Web Interface, including MIPS APMs that report through the CMS Web Interface, are required to submit a set of predetermined measures and are unable to submit additional measures (other than the CAHPS for MIPS survey). For that submission mechanism, we proposed to apply bonus points based on the finalized set of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures. We would assign two bonus points for each outcome measure (after the first required outcome measure) and for each patient experience measure. We would also have one additional bonus point for each other high priority measure (patient safety, efficiency, appropriate use, care coordination). We believe MIPS eligible clinicians or groups should have the ability to receive bonus points for reporting high priority measures through all submission mechanisms, including the CMS Web Interface. In this final rule with comment period, we will publish how many bonus points the CMS Web Interface measure set would have available based on the final list of measures (See Table 21).

We proposed to cap the bonus points for the high priority measures (outcome, appropriate use, patient safety, efficiency, patient experience, and care coordination measures) at 5 percent of the denominator of the quality performance category score. Tables 19 and 20 of the proposed rule (81 FR 28257-28258) illustrated examples of how to calculate the bonus cap. We also proposed an alternative approach of capping bonus points for high priority measures at 10 percent of the denominator of the quality performance category score. Our rationale for the 5 percent cap was that we do not want to mask poor performance by allowing a MIPS eligible clinician to perform poorly on a measure but still obtain a high quality performance category score by submitting numerous high priority measures in order to obtain bonus points; however, we were also concerned that 5 percent may not be enough incentive to encourage reporting. We requested comment on the appropriate threshold for this bonus cap.

The following is a summary of the comments we received regarding our proposal to provide bonus points for high priority quality measures.

Comment: Several commenters supported our proposal to award two bonus points for reporting additional outcome or patient experience measures and one bonus point for reporting any other high priority measure, indicating that rewarding bonus points would provide an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

additional incentive to report on measures which were of higher value to patients.

Response: We appreciate the support of the commenters for our proposals. We are finalizing the proposal to assign two bonus points for reporting additional outcome or patient experience measures and one bonus point for reporting any other high priority measure.

Comment: Some commenters recommended that outcome, patient experience, and other high priority measures not be required for reporting but should be awarded bonus points if they are reported, including the first high priority measure reported.

Response: Our long term goal for the Quality Payment Program is to move reporting towards high priority measures. We believe that our proposal to require an outcome measure or another high priority measure if an outcome measure is not available presents a balanced approach that will encourage more reporting of these measures. We are concerned that the use of these measures would be much more limited and selective if reporting of one of these measures were not required.

Comment: A number of commenters expressed concern with the proposal to award bonus points for the reporting of additional high priority measures because many specialties do not have sufficient outcome, patient experience or other high priority measures to receive bonus points. Some commenters expressed concern about the future development of outcome measures due to lack of available clinical evidence and poor risk adjustment.

Response: By awarding bonus points for the reporting of additional high priority measures, we are encouraging a movement towards stronger development of measures that are aligned with our measurement goals. We encourage stakeholders who are concerned about a lack of high priority measures to consider development of these measures and submit them for future use within the program. In addition, our strategy for identifying and developing meaningful outcome measures are in the MACRA quality measure development plan, authorized

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

by section 102 of the MACRA (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>).

The plan references how we plan to consider evidence-based research, risk adjustment, and other factors to develop better outcome measures.

Comment: A commenter recommended that CMS identify a small number of high priority measures including patient-reported outcome measures that would be tested on a regional scale before being implemented nationally. This commenter recommended that these proposed high priority measures should be vetted with other stakeholders.

Response: We believe that our proposed measure set provides flexibility for clinicians in determining which measures to report. All measures go through a review process that includes public comment as part of the rulemaking process, and most measures are reviewed by the NQF-convened MAP as part of CMS' pre-rulemaking process.

Comment: A commenter recommended that CMS move toward establishing core sets of high priority measures by specialty or subspecialty. This would enable consumers and purchasers to make direct comparisons of similar clinicians with assurance that they are all being assessed against a consistent and standardized set of important quality indicators.

Response: As part of this rule, we have finalized specialty measure sets that may simplify the measure selection process. We continue to encourage the development of outcome and other high priority measures that may be reported and relevant to all specialties of medicine.

Comment: A commenter supported the concept of incentivizing clinicians to submit high priority measures given that they can be more challenging; however, this commenter sought clarification on which measures submitted by QCDRs would be considered high priority. This same commenter indicated that QCDRs should be allowed to determine the most appropriate classification for each of its measures, including which measures should be considered high

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

priority, subject to the QCDR measure approval process.

Response: We define high priority to measures as those based on the following criteria: outcome, appropriate use, patient safety, efficiency, patient experience and care coordination measures. For non-MIPS measures reported through QCDRs, we proposed to classify which measures are high priority during the measure review process (81 FR 28186). If the measure is endorsed by NQF as an outcome measure, we will take that designation into consideration. If we decide to assign these domains to QCDR measures, we will add the high priority designation to QCDR measures accordingly. Although we may enlist the assistance and consultation of the QCDR in assessing high priority measures, we would still make the final high priority designation.

Comment: One commenter requested clarity on measures which are identified as a high priority and noted that, based on past reporting statistics, certain high-priority measures may be classified as topped out. The commenter requested clarification on what this means for the MIPS eligible clinician's score.

Response: Any high priority measure that is topped out will still be eligible for bonus points. We think incentives should remain to report high priority measures, even topped out measures, as additional reporting makes for a more comprehensive benchmark and can help confirm that the measure is truly topped out. Also, as discussed in section II.E.6.a.(2)(c) of this final rule with comment period, we are not implementing any special scoring for topped out measures in year 1 of MIPS. Thus, the score for that measure will not be reduced by our proposed mid-cluster approach for topped out measures in CY 2017. We will not modify the benchmark methodology for any topped out measures for the CY 2017 performance period. We will modify the benchmark methodology for topped out measures beginning with the CY 2018 performance period, provided that it is the second year the measure has been identified as topped

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

out. We will propose options for scoring topped out measures through future rulemaking.

Comment: One commenter supported our proposal to award 2 bonus points for outcome measures but recommended that only 1 bonus point be awarded for the reporting of patient experience measures.

Response: We believe that patient experience measures align with our measurement goals and for that reason should be awarded the same number of bonus points as outcome measures.

Comment: One commenter requested clarification as to whether a MIPS eligible clinician can earn bonus points if the MIPS eligible clinician does not report all 6 measures due to lack of available measures.

Response: The MIPS eligible clinician can receive bonus points on all high priority measures submitted, after the first required high priority measure submitted, assuming these measures meet the minimum case size and data completeness requirements even if the MIPS eligible clinician did not report all 6 required measures due to lack of available measures.

Comment: One commenter recommended that CMS pursue additional approaches to the quality performance category to advance health equity and reward MIPS eligible clinicians who promote health equity including: adding measures stratified by race and ethnicity or other disparity variable, and developing and adding a stand-alone health equity measure as a high priority measure for which clinicians can receive a bonus point.

Response: Eliminating racial and ethnic disparities to achieve an equitable health care system is one of the four foundational principles listed in the CMS Quality Strategy. We refer readers to the MACRA quality measure development plan, authorized by section 102 of the MACRA (<https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/MACRA-MIPS-and-APMs/Final-MDP.pdf>). The plan

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

outlines the many ways we look to identify, measure and reduce disparities. We will consider in future rulemaking the commenter's proposed options to advance health equity and reward MIPS eligible clinicians who promote health equity.

After consideration of the comments, we are finalizing at §414.1380(b)(1)(xiii) our proposal to award 2 bonus points for each outcome or patient experience measure and 1 bonus point for each other high priority measure that is reported in addition to the 1 high priority measure that is already required to be reported under the quality performance category submission criteria. We will revisit this policy in future years. High priority measures are defined as outcome, appropriate use, patient safety, efficiency, patient experience and care coordination measures, as identified in Tables A through D in the Appendix of this final rule with comment period. For the CMS Web Interface, we will apply bonus points based on the finalized set of measures reportable through that submission mechanism. MIPS eligible clinicians will only receive bonus points if they submit a high priority measure with a performance rate that is greater than zero, provided that the measure meets the case minimum and data completeness requirements. We believe that this will encourage stronger reporting of those measures that are more closely aligned to our measurement goals.

The following is a summary of the comments we received regarding our proposal for establishing a cap on bonus points awarded for the reporting of additional high priority measures:

Comment: Some commenters opposed our proposal to cap bonus points for high priority measures. Others recommended that the cap be increased from 5 percent of the denominator as proposed to 10 percent of the denominator as in our alternative option. Those who opposed the cap on bonus points at 5 percent of the denominator believe that the 5 percent cap was too low to encourage the reporting of high-priority measures. One commenter requested that CMS share a data analysis demonstrating the necessity for a cap. Others cautioned that quality measures and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the available bonus points may be selected, not for the benefit of the clinician or patient, but only to obtain the bonus points, and that this defeats the purpose of true quality measurement for quality patient care.

Response: After consideration of the comments, we believe increasing the cap on bonus points to 10 percent of the quality score denominator for high priority measures provides a strong incentive to report these measures while still providing a necessary safeguard to avoid masking poor performance. While our long term goals for the program are to move towards the use of outcome and other high priority measures as much as possible, we also acknowledge the important role that other measures play at this time. We remain concerned, however, that without a cap in place, or with a cap that is too high, we could incentivize the reporting of additional measures over a focus on performance in relevant clinical areas, and mask poor performance with higher bonus points. We understand commenters' concern that quality measures and the available bonus points may be selected, not for the benefit of the clinician or patient, but only to obtain the bonus points. We have identified high priority measures to encourage meaningful measurement in each of the high priority areas and believe MIPS eligible clinicians who report on these measures will continue to work to improve their performance in these areas accordingly. At the same time, we will continue to monitor reporting trends and revisit our policies on bonus points for high priority measures as the program develops in future years.

Comment: Some commenters were concerned that at a 5 percent cap, CMS may be incentivizing the reporting of a high priority measure over high performance on another measure. Some commenters recommended that CMS defer awarding bonus points for high priority measures to reduce the complexity of the scoring methodology within the quality performance category.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We do not believe that raising the bonus cap of 10 percent will mask poor performance. Instead, we believe it will encourage additional reporting of these outcome and high priority measures. We note that we will not assign bonus points if an additional high priority measure is reported with a zero performance rate or if the reported measure does not meet the case minimum or data completeness requirements. We believe that this approach will avoid the issue that the commenters have identified. We will closely monitor reporting trends to ensure that this balance is maintained.

Comment: One commenter recommended that we cap the bonus points that CMS Web Interface users can earn as the CMS Web Interface includes several high priority measures.

Response: We believe the bonus points should be applied consistently across all submission mechanisms. Groups who report via the CMS Web Interface submit data on a pre-defined set of measures and do not have the ability to report on additional measures through another submission mechanism (other than the CAHPS for MIPS survey). We note that CMS Web Interface users are subject to the same 10 percent cap that all other MIPS eligible clinicians have, so CMS Web Interface users will not receive any additional credit compared to other MIPS eligible clinicians. We will closely monitor reporting trends to address commenter's concern that Web Interface users do not receive an unfair advantage by having more high priority measures available to them than other MIPS eligible clinicians.

After consideration of the comments, we are finalizing at §414.1380(b)(1)(xiii) a modification to the proposed high priority measure cap. Specifically, we are increasing the cap for high priority measures from 5 percent to 10 percent of the denominator (total possible points

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the MIPS eligible clinician could receive in the quality performance category)<sup>30</sup> of the quality performance category for the first 2 years. We believe that this cap protects against rewarding reporting over performance while still encouraging reporting of the types of measures which will form the foundation of the future of the program. In future years, we plan to decrease this cap over time.

(f) Incentives to use CEHRT to Support Quality Performance Category Submissions

Section 1848(q)(5)(B)(ii) of the Act provides that under the methodology for assessing the total performance of each MIPS eligible clinician, the Secretary shall: (1) encourage MIPS eligible clinicians to report on applicable measures under the quality performance category through the use of CEHRT and QCDRs; and (2) for a performance period for a year, for which a MIPS eligible clinician reports applicable measures under the quality performance category through the use of CEHRT, treat the MIPS eligible clinician as satisfying the CQMs reporting requirement under section 1848(o)(2)(A)(iii) of the Act for such year. To encourage the use of CEHRT for quality improvement and reporting on measures under the quality performance category, we proposed a scoring incentive to MIPS eligible clinicians who use their CEHRT systems to capture and report quality information.

We proposed to allow one bonus point for each measure under the quality performance category score, up to a maximum of 5 percent of the denominator of the quality performance category score if:

- The MIPS eligible clinician uses CEHRT to record the measure's demographic and

---

<sup>30</sup> For example, the denominator for a MIPS eligible clinician who is a solo practitioner would be 60 points if the clinician has six applicable measures (6 measures x 10 points). If the MIPS eligible clinician, who is a solo practitioner, only has 5 applicable measures, then the denominator would be 50 points (5 measures x 10 points). A group of 16 or more would have a denominator of 70 points assuming the group had 6 applicable measures and enough cases to be scored on the readmission measure (7 measures x 10 points).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinical data elements in conformance to the standards relevant for the measure and submission pathway, including but not necessarily limited to the standards included in the CEHRT definition proposed in §414.1305;

- The MIPS eligible clinician exports and transmits measure data electronically to a third party using relevant standards or directly to us using a submission method as defined at §414.1325; and

- The third party intermediary (for example, a QCDR) uses automated software to aggregate measure data, calculate measures, perform any filtering of measurement data, and submit the data electronically to us using a submission method as defined at §414.1325.

These requirements are referred to as “end-to-end electronic reporting.”

We note that this bonus would be in addition to the bonus points for reporting high priority measures. MIPS eligible clinicians would be eligible for both this bonus option and the high priority bonus option with separate bonus caps for each option. We also proposed an alternative approach of capping bonus points for this option at 10 percent of the denominator of the quality performance category score. Our rationale for the 5 percent cap was that we do not want to mask poor performance by allowing a MIPS eligible clinician to perform poorly on a measure but still obtain a high quality performance category score; however, we were also concerned that 5 percent may not be enough incentive to encourage end-to-end electronic reporting. We sought comment on the appropriate threshold for this bonus cap. We proposed the CEHRT bonus would be available to all submission mechanisms except claims submissions. This incentive would also be available for MIPS APMs reporting through the CMS Web Interface (except in cases where measures are entered manually into the CMS Web Interface). Specifically, MIPS eligible clinicians who report via qualified registries, QCDRs, EHR submission mechanisms, and CMS Web Interface in a manner that meets the end-to-end

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reporting requirements may receive one bonus point for each reported measure with a cap as described. We did not propose to allow this option for claims submission, because there is no mechanism for MIPS eligible clinicians to identify the information was pulled using an EHR.

This approach supports and encourages innovative approaches to measurement using the full array of standards ONC adopts, and the data elements MIPS eligible clinicians capture and exchange, to support patient care. Thus, approaches where a qualified registry or QCDR obtains data from a MIPS eligible clinician's CEHRT using any of the wide range of ONC-adopted standards and then uses automated electronic systems to perform aggregation, calculation, filtering, and reporting would qualify each such measure for the CEHRT bonus point. In addition, measures submitted using the EHR submission mechanism or the EHR submission mechanism through a third party would also qualify for the CEHRT bonus.

We requested comment on this proposed approach.

The following is a summary of the comments we received regarding our proposal to award CEHRT bonus points for end-to-end electronic submissions.

Comment: Commenters questioned whether the 5 percent cap would provide a worthwhile incentive. One commenter noted that the potential bonus points are so diluted that physicians will not be motivated to navigate the additional complexity of earning a bonus point. Others supported the higher cap.

Response: We agree with commenters that capping the bonus available at 5 percent would not provide a sufficient incentive to utilize CEHRT for reporting in the initial years of the program; Accordingly, we are finalizing our alternative option that a provider may receive bonus points up to 10 percent of the denominator of the quality performance category score for the first 2 years of the program. We intend to decrease these cap in future years through future notice and comment rulemaking.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter recommended giving 2 points, not 1, for the CEHRT incentive.

Response: We agree with the commenter that the proposed bonus would not provide a sufficient incentive for MIPS eligible clinicians. Although we are not increasing the points per-measure that a clinician can earn by conducting electronic end-to-end reporting, we are finalizing our alternate option which would cap the bonus a clinician may earn at 10 percent instead of 5 percent of the denominator of the quality performance category score.

Comment: A few commenters wanted bonus incentives for use of QCDRs. Currently, many QCDRs, including specialty registries, cannot obtain data from CEHRT or support the standards for data submission. The commenters believed that clinicians should still receive bonus points if they transfer data from an EHR into their own registry. One commenter recommended that CMS encourage EHRs to embrace interoperability so that data transfer can occur between EHR and QCDRs. Another commenter stated that CMS should also offer bonus points to clinicians who use a QCDR (regardless of its ties to CEHRT) since QCDRs in and of themselves represent robust electronic data submission for a growing number of clinicians.

Response: We appreciate commenters' support for the use of QCDRs. Under the policy we are finalizing, MIPS eligible clinicians who capture their data using CEHRT and electronically export and transmit this data to a QCDR which uses automated software to aggregate measure data, calculate measures, perform any filtering of measurement data, and submit the data electronically via a submission method defined at §414.1325, would be able to earn a bonus point. Any submission pathway that involves manual abstraction and re-entry of data elements that are captured and managed using certified health IT is not end-to-end electronic quality reporting and is not consistent with the goal of the bonus. It is, however, important to note that end-to-end electronic submission is a goal for which bonus points are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

available, and not a requirement to achieve maximum performance in the quality performance category.

Comment: Some commenters supported the proposed bonus points for the use of certified EHR technology. One commenter agreed with the inclusion of bonus points to encourage reporting via QCDR and CEHRT, but was concerned that giving bonus points for reporting via the CMS Web Interface and via Qualified Registry would not encourage use of QCDRs and CEHRT, and that giving bonuses for all of these methods would function as a penalty for those who submit via claims. This commenter encouraged either only giving bonus points to CEHRT or QCDR-based submissions or attaching more bonus points to these mechanisms. Another commenter recommended that CMS encourage the continued uptake of CEHRT and QCDRs by awarding bonus points for use of those technologies and not by unfairly penalizing MIPS eligible clinicians that have not yet adopted them. One commenter appreciated the optional bonus points that can be awarded for the use of CEHRT, as this is foundational to the functionality needed for a quality program of this magnitude.

Response: We appreciate commenters' support for the proposed bonus for use of CEHRT. We want to encourage increased usage of CEHRT and believe this functionality should be available for qualified registries and CMS Web Interface as well as EHR and QCDR submission.

Comment: Commenters wanted clarification on how to determine which measures qualify for end-to-end electronic reporting, as measures reported through the CMS Web Interface and QCDR may or may not involve "end-to-end" electronic reporting. Commenters requested that CMS consider any measures coming from an electronic source to an electronic source, following relevant standards, as eligible for the electronic reporting bonus points. One commenter proposed clarifying our requirement for "end-to-end reporting" as follows: "in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

conformance to the standards relevant for the measure and submission pathway allows the manner in which the specific registry requires the data submission, such as data derived from an electronic source, which might not be CEHRT, and the destination is electronic. One commenter noted that many clinicians will not have end-to-end electronic capability by 2018 for reasons outside of their control.

Response: The end-to-end electronic reporting bonus point is not specific to certain CQMs, but would apply in any case where the submission pathway maintains fully electronic management and movement of patient demographic and clinical data once it is initially captured in the eligible clinician's certified health IT. Where a registry is calculating and submitting the Quality Payment Program-accepted measures on the MIPS eligible clinician's behalf, this means that: (1) the MIPS eligible clinician uses certified health IT to capture and electronically provide to the registry clinical data for the measures, using appropriate electronic means (for example, through secure access via API or by electronic submission of QRDA documents); and (2) the registry uses verifiable software to process the data, calculate, and report measure results to CMS (in CMS-specified electronic submission format). In order to qualify for a bonus point, submission via a QCDR or the CMS Web Interface would need to adhere to these principles. Any submission pathway that involves manual abstraction and re-entry of data elements that are captured and managed using certified health IT is not end-to-end electronic quality reporting and is not consistent with the goal of the bonus. We understand that not all clinicians may have end-to-end electronic capabilities immediately, and note that end-to-end electronic submission is a goal for which bonus points are available, and not a requirement to successfully participate in MIPS. We are finalizing policies that offer MIPS eligible clinicians substantial flexibility and sustain proven pathways for successful participation across all of the performance categories. As noted by the commenter, we have, included some pathways to which the end-to-end electronic

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reporting bonus points may not apply in 2017. For example, if a MIPS eligible clinician submits electronic data to a registry, but the electronic data is not captured from certified health IT or if a MIPS eligible clinician uses CEHRT to capture data, but then calculates measures using chart abstraction and submits the resulting measures to CMS, then the MIPS eligible clinician would not be eligible for the end-to-end electronic reporting bonus points. Those MIPS eligible clinicians who are already successfully reporting quality measures meaningful to their practice via one of these pathways may continue to do so, or may of course choose a different pathway, if they believe the different pathway will offer them a better avenue for success in MIPS.

Comment: Several commenters requested that CMS create incentives to make CEHRT more flexible because many registries rely on both automated and manual data entries.

Commenters were concerned that most EHRs do not support all the necessary data elements for advanced quality measures or analytics and require hybrid approaches to data collection, but that other electronic submissions have that data. The commenters believed that CMS should reward eligible clinicians for utilizing registries, leveraging electronic capture, reporting where it is feasible, and using alternative methods including manual data entry. One commenter wanted to incorporate use of an EHR with a registry system to minimize double reporting and documentation.

Response: We are finalizing policies that offer MIPS eligible clinicians substantial flexibility and sustain proven pathways for successful participation. For purposes of the end-to-end electronic reporting bonus point, the pathway should maintain fully electronic management and movement of data once it is initially captured in the MIPS eligible clinician's health IT. Standards-based, interoperable methods for managing quality measurement data are essential for improving the value of measures to MIPS eligible clinicians while reducing these clinicians'

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

data-handling burdens. We would expect the elements of a hybrid measure that use essential patient demographic and clinical data normally managed in CEHRT or other certified health IT for care delivery and documentation (for example, Common Clinical Data Set elements) could be made available to the registry using electronic means. Electronic means would include transmission in any Clinical Document Architecture format supported by the CEHRT, or an appropriately secure API.

We recommend and encourage all registries to pursue standards-based, fully electronic methods for accurately extracting and importing data from other electronic sources, in addition to data supported by CEHRT and other ONC-Certified Health IT, as appropriate to their measures. However, we recognize that for some types of measures some supplementation of the data normally recorded in EHRs in the course of care may in the near future still require registries to continue alternate, including manual, means of harvesting the data elements not yet practically available using electronic means. In future years, we anticipate evolving data standards and data aggregation and management services infrastructure, including robust registries capable of seamlessly aggregating and analyzing data across multiple electronic types and sources, will eventually eliminate the burden of manual processes including abstraction.

Comment: One commenter noted that utilizing the CMS Web Interface would involve abstraction and therefore not truly be completely electronic, and recommended that the bonus point for "end to end" quality measure submission be applied only when data is submitted from the CEHRT to CMS. Another commenter noted the proposed rule does not address whether data scrubbing is allowed when the MIPS eligible clinician is receiving bonus points for using these methods. The commenter believed data scrubbing is necessary to improve the accuracy of quality measures and recommends that CMS clarify that data scrubbing does not nullify bonus points for data submission.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We are finalizing our proposed policy that the CEHRT bonus would be available for groups using CMS Web Interface for measures submitted in a manner that meets the end-to-end reporting requirements. CMS Web Interface users may receive one bonus point for each reported measure with a cap of 10 percent of the denominator of the quality performance category. For CMS Web Interface users, we define end-to-end electronic reporting as cases where users upload data that has been electronically exported or extracted from EHRs, electronically calculated, and electronically formatted into a CMS-specified file that is then electronically uploaded via the Web Interface as opposed to cases where measures are entered manually into the CMS Web Interface.

Any submission pathway that involves manual abstraction and re-entry of data elements that are captured and managed using certified health IT is not end-to-end electronic quality reporting and is not consistent with the goal of bonus. Thus, the bonus points would not apply to measures entered manually into the CMS Web Interface, though those measurements would be included in the MIPS eligible clinician's scoring for the performance category.

We do not believe limiting the bonus points to the relatively small number of measures that we will be able to accept directly from CEHRT for the 2017 performance period would be the best way to recognize and encourage development of other standards-based, interoperable methods for managing quality measurement data. If a MIPS eligible clinician finds the measures most meaningful to their practice in a registry, and makes patient clinical and demographic data captured and managed using certified health IT available to the registry for use in calculating a measure, that is consistent with the goals of end-to-end electronic reporting, stimulating innovation in the use of standards to re-use data captured in the course of care to advance more timely and affordable availability of meaningful measure measurements to help drive continuous improvement.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Others were concerned that limiting data sources to CEHRT alone would eliminate the potential for obtaining bonus points for many specialties and practice types. Commenters expressed concern that their electronic data sources cannot be certified or that financial constraints make these resources unavailable.

Response: Bonus points apply both to measures that can be captured, calculated, and reported only using CEHRT and to measures for which only some of the data elements needed for the measure are currently supported by CEHRT. For purposes of the end-to-end electronic reporting bonus points, the pathways for those patient demographic and clinical data that are initially captured in the eligible clinician's certified health IT (including but not necessarily limited to those modules required to meet the CEHRT definition for MIPS) should maintain fully electronic management and movement from the clinician through measure submission to CMS. For example, where a registry is calculating and submitting MIPS-accepted measures that each use one or more data elements captured and managed for care delivery and documentation using certified health IT (such as, but not limited to, elements included in the Common Clinical Data Set), this means that: (1) the eligible clinician uses certified health IT to capture and electronically provide to the registry those clinical data using appropriate electronic means; and (2) the registry uses verifiable software to process the data, calculate, and report measure results to CMS using appropriate electronic means. Appropriate electronic means for getting data from the certified health IT to the registry would include secure access via API or by electronic submission of QRDA or other Clinical Document Architecture documents, and appropriate electronic means of measure submission from the registry to CMS would be the CMS-specified electronic submission format.

Comment: One commenter disagreed with the decision to award bonus points to MIPS eligible clinicians who report using their CEHRT since their EHR vendor is charging a high fee

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

by compiling the data and reporting the measures themselves instead of directly from the EHR.

Response: We appreciate the commenter's concerns. We believe the awarding of bonus points for use of CEHRT is important to incentivize solutions, which ultimately reduces cost and burden to MIPS eligible clinicians. Our approach also encourages clinicians to consider a range of options to determine which health IT systems and submission mechanisms will provide the best value to their practice. We expect that over time, as the technology to support electronic reporting evolves and more options become available, the cost and administrative burden on participants leveraging these technologies will continue to decrease.

Comment: One commenter wanted the CEHRT bonus for claims based reporting.

Response: The CEHRT bonus is designed for submission of data captured utilizing CEHRT. We did not propose to allow this option for claims submission because there is no mechanism for MIPS eligible clinicians to identify the information included in the claims submission was pulled using CEHRT.

Comment: One commenter was concerned that there are fewer EHR products available that can provide the reporting functionality necessary to carry out the MIPS requirements. One commenter noted that CEHRT standards fall short of providing QRDA or appropriate functionality without errors.

Response: ONC's 2014 Edition and 2015 Edition Health IT Certification criteria<sup>31</sup> do align with the Quality Payment Program requirements. Specifically, the 2015 Edition, while not required for 2017, offers rigorous testing for more features and functionality than have prior editions of certification. Each developer will need to decide how best to support the needs of its users, but we expect that between now and 2018, when the MIPS requirements to use technology

---

<sup>31</sup> 45 CFR 170.314(c)(1) through (c)(3) and 170.315(c)(1) through (c)(3) and optionally (c)(4).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

certified to the 2015 Edition will be in full effect, that more products will be certified to the 2015 Edition in order to support their users' needs for MIPS program participation. As CMS and ONC assess the impact of our policies and learn from the transition year of the Quality Payment Program (along with health IT vendors and MIPS eligible clinicians and groups) we will continue advancing health IT certification infrastructure and support in parallel to the needs of developers, clinicians, and other care providers to encourage the continued development, adoption and use of certified health IT including quality measurement standards to increase the availability of standards-based, interoperable data management and aggregation technology.

After consideration of the comments, we are finalizing at §414.1380(b)(1)(xiv) one bonus point is available for each measure submitted with end-to-end electronic reporting for a quality measure under certain criteria described in this section. We are modifying the CEHRT bonus cap. Specifically, we are increasing the cap for using CEHRT for end-to-end reporting from 5 percent to 10 percent of the denominator of the quality performance category (total possible points for the quality performance category) for the first 2 years. We intend to decrease this cap in future years through future notice and comment rulemaking. MIPS eligible clinicians will be eligible for both the CEHRT bonus option and the high priority bonus option with separate bonus caps for each option. The CEHRT bonus will be available to all submission mechanisms except claims submissions.

We are finalizing that the CEHRT bonus would be available to all submission mechanisms except claims submissions. Specifically, MIPS eligible clinicians who report via qualified registries, QCDRs, EHR submission mechanisms, and CMS Web Interface in a manner that meets the end-to-end reporting requirements may receive one bonus point for each reported measure with a cap as described. For Web Interface users, we define end-to-end electronic reporting as cases where users upload data that has been electronically exported or extracted

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

from EHRs, electronically calculated, and electronically formatted into a CMS-specified file that is then electronically uploaded via the Web Interface as opposed to cases where measures are entered manually into the CMS Web Interface.

Due to requests from many commenters that we provide more clarity around the various options for a MIPS eligible clinician to satisfy the “end-to-end electronic” requirements and to earn the CEHRT bonus points, we are providing additional explanation regarding the final policy.

There are several key steps common across all of the submission pathways for end-to-end electronic reporting: (1) the collection of data at the point of care; (2) calculation of CQM performance as a numerator/denominator ratio; and (3) submission of the data to CMS using a standard format. ONC’s certification regulations (45 CFR 170.315(c)(1-3) in the 2015 edition) have established several independent but complementary quality measurement capability criteria to which health IT modules can be certified because some health IT may not support all of the steps in the measurement process. For example, one application may support capturing the clinical data at the point of care (step 1), but not the calculation of measure results (step 2) or reporting of them to payers like CMS (step 3). Instead, that application may be built to export the measurement data in standard format to another application that performs the calculation and reporting functions but may not support initial data capture provide that feature. Some health IT applications are capable of performing each step necessary from data capture to CMS submission.

Although certification for each of these steps helps to ensure accurate calculation and reporting measures, our final policy seeks to offer MIPS eligible clinicians the opportunity to earn bonus points for a wider array of measurement pathways rather than the EHR submission method currently available only for eCQMs for which a health IT product, service, or registry

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

could be certified under ONC’s Health IT Certification Program as being in conformance with CMS-published specifications. At this time, we believe it is important to ensure incentives are tied to a wider array of submission pathways that facilitate automated, electronic reporting. However, we continue to believe that standards-based, interoperable methods for managing quality measurement data are essential for both improving the value of measures to eligible clinicians while reducing these clinicians’ data-handling burdens.

In a 2014 concept paper, [Connecting Health and Care for the Nation: A 10-Year Vision to Achieve an Interoperable Health IT Infrastructure](#)<sup>[32]</sup>, ONC described how interoperability is necessary for a “learning health system” in which health information flows seamlessly and is available to the right people, at the right place, at the right time to better inform decision making to improve individual health, community health, and population health. The vision that ONC and CMS share for health IT in the learning health system is that it will integrate seamlessly with efficient, clinical care processes, while sustaining strong protections for the security and integrity of the data. Within that infrastructure, quality improvement support functions are increasingly expected to enable and rely upon the seamless aggregation, routine analysis, and automated electronic management of data needed to deliver meaningful, actionable feedback on clinician performance and treatment efficacy while minimizing data-related burdens on clinicians. As we implement, observe, and learn from the transition year of the Quality Payment Program, CMS and ONC will continue working in close partnership to enable ONC to continue advancing health IT certification infrastructure in parallel to the needs of clinicians, other providers, consumers, purchasers, and payers who will increasingly rely on standards-based, interoperable data management and aggregation technology to better measure and continuously improve safety,

The document published in the Federal Register is the official HHS-approved document.

quality, and value of care.

Table 18, summarizes at a high level several pathways we expect to be widely available to MIPS eligible clinicians in 2017 and 2018 for quality performance reporting and which of these pathways would earn bonus points for use of CEHRT to report quality measures electronically from capture to CMS (“end-to-end”).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 18: Examples Illustrating How End-to-End Electronic Reporting Requirements Work**

MIPS eligible clinician scenario	Actions Taken	Then meets end-to-end reporting bonus
1) Uses health IT certified to §170.314 or §170.315(c)(1-3) – that is, the MIPS eligible clinician’s system is certified capable of capturing, calculating, and reporting MIPS eQMs	MIPS eligible clinician uses their e-measure–certified health IT to submit MIPS eCQM to CMS via EHR data submission mechanism (described at 42 CFR 414.1325)	Yes
2) Uses health IT certified to § 170.314 or §170.315(c)(1) to capture data and export MIPS eCQM data electronically to a third-party intermediary	The third-party intermediary is certified to be in conformance with §170.415 (c)(2-3) (import data/calculate, report results) for each measure; and calculates and submits MIPS eQMs	Yes
3) Uses health IT certified to §170.314 or §170.315(c)(1) to capture data and export a MIPS eCQM electronically to a QCDR.	QCDR uses automated, verifiable software to process data, calculate and electronically report to a MIPS eCQM to CMS consistent with CMS-vetted protocols	Yes
4) Uses certified health IT, including but not necessarily limited to that needed to satisfy the definition of CEHRT at §414.1305, to capture demographic and clinical data and transmit it to a QCDR using appropriate Clinical Document Architecture standard (such as QRDA or C-CDA).	QCDR uses automated, verifiable software to process data, calculate and electronically report to MIPS approved non-MIPS measures consistent with CMS-vetted protocols	Yes
5) Uses certified health IT, including but not necessarily limited to that needed to satisfy the definition of CEHRT at §414.1305, to capture demographic and clinical data. Makes data available to a third-party intermediary via secure application programming interface (API).	The third-party intermediary uses automated, verifiable software to process data, calculate and electronically report to MIPS approved non-MIPS measures consistent with CMS-vetted protocols	Yes
6) Uses certified health IT, including but not necessarily limited to that needed to satisfy the definition of CEHRT at §414.1305, to capture demographic and clinical data and transmit it to the third-party intermediary using appropriate standard or method (QRDA, C-CDA, API).	The eligible clinician or group, or a third-party intermediary uses automated, verifiable software to process data, calculate and reports to MIPS approved measures through manual entry, or manual manipulation of an uploaded file, into a CMS web portal	No; manual entry interrupted data flow and electronic calculation is not verified.
7) Uses certified health IT to support patient care and capture data but abstracts it manually into a web portal or abstraction-input app	The third-party intermediary uses automated, verifiable software to process data, calculate and report measure	No; manual abstraction interrupted data flow

In the first example in Table 18, for MIPS eQMs, when a MIPS eligible clinician wishes to use CEHRT for the entire process of data capture to CMS submission, the health IT solution must be certified to §170.315(c)(1-3) in order to achieve the bonus point.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

In the second and third examples, the MIPS eligible clinician has chosen to participate in a registry or QCDR and report eCQMs. This MIPS eligible clinician sends quality data electronically from CEHRT to the registry, and the registry calculates the measure results and eventually submits the eCQMs data to CMS on the eligible clinician's behalf. In the second case, the registry uses health IT that is certified to §170.315(c)(2-3) in order for the MIPS eligible clinician to earn the bonus points for end-to-end electronic reporting. In the third case, the QCDR does not use health IT that is certified to a particular standard, but uses automated, verifiable software to process data, calculate and electronically report a MIPS eCQM to MIPS consistent with CMS-vetted protocols. In both of these cases, a MIPS eligible clinician or group would earn a bonus point for each measure submitted in this manner, up to a 10 percent cap.

In both the fourth and fifth examples, the MIPS eligible clinician has chosen to participate in a QCDR and report on the MIPS-accepted non-MIPS (registry) measures. The MIPS eligible clinician uses CEHRT, and perhaps some additional certified health IT modules, in the normal course of clinical documentation and this certified health IT captures clinical data needed for the MIPS eligible clinician's selected registry measures. In both the fourth and fifth examples, the QCDR has satisfied the MIPS criteria, including obtaining CMS' approval of the non-MIPS measures this MIPS eligible clinician is using. In these cases, the QCDR processes the clinical data to calculate measure results and reports the MIPS-approved non-MIPS measures consistent with CMS-vetted protocols. The only difference between these two examples is how the data gets from the MIPS eligible clinician's certified health IT to the QCDR. In the fourth example, the MIPS eligible clinician's certified health IT transmits quality data documents to the registry in QRDA or other Clinical Document Architecture standard format. In the fifth example, the MIPS eligible clinician has made appropriate arrangements to grant the registry access to the quality measurement information via a secure application programming interface (API). We

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

have presented both examples to emphasize that the MIPS eligible clinician would receive the bonus point under each scenario. Either the secure transmission of data within CDA documents or a secure API is an electronic method of managing and moving the quality measurement data to where it is needed.

In the sixth example, the group, or a third party submitting data on their behalf, may use the CMS Web Interface to submit electronic data for quality measure submissions. However, such a submission would only be awarded the bonus for end-to-end reporting if the submission included uploading an electronic file without modification. This is to preserve the electronic flow of data end-to-end and provide a verifiable method to ensure that manual abstraction, manual calculation, or subsequent manual correction or manipulation of the measures using abstraction did not occur.

Finally, in the last example, the MIPS eligible clinician initially captures data electronically, but manually abstracts the data for analysis and keys it into a web portal used by a registry. The registry then calculates and submits the measure results to CMS electronically. In this case, no bonus point would be given as the manual abstraction process interrupted the complete end-to-end electronic data flow.

#### (g) Calculating the Quality Performance Category Score

The next two subsections provide a detailed description of how the quality performance category score would be calculated under our finalized policies.

#### (i) Calculating the Quality Performance Category Score for Non-APM Entity, Non-CMS Web Interface Reporters

To calculate the quality performance category score, we proposed to sum the weighted points assigned for the measures required by the quality performance category criteria plus the bonus points and divide by the weighted sum of total possible points. (81 FR 28256)

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

If a MIPS eligible clinician elects to report more than the minimum number of measures to meet the MIPS quality performance category criteria, then we would only include the scores for the measures with the highest number of assigned points. In the proposed rule (81 FR 28257), we provided an example for how this logic would work. The quality performance category score would be capped at 100 percent.

We proposed that if a MIPS eligible clinician has met the quality performance category submission criteria for reporting quality information, but does not have any scored measures as discussed in section II.E.6.b.(2) of the proposed rule, then a quality performance category score would not be calculated. Refer to section II.E.6.a.2.d. of the proposed rule (81 FR 28254) for details on how we proposed to address scenarios where a quality performance category score is not calculated for a MIPS eligible clinician. We requested comment on our proposals to calculate the quality performance category score.

The following is summary of the comments we received on our proposals to calculate the quality performance category score.

Comment: Several commenters expressed concern about the complexity of the scoring approach. One commenter recommended taking an average of the performance percentages as an alternative.

Response: We have simplified our methodology for scoring the quality performance category. For example, during the transition year, we are adding a floor of 3 points for any submitted measure (class 1 or class 2 measures as defined in Table 17, as discussed in section II.E.6.a.(2)(c) of this final rule with comment period). This adjustment will minimize the number of measures that are not scored and stabilize the denominator of the MIPS quality performance category score. This also ensures that all MIPS eligible clinicians will have a quality performance category score. As discussed in the Web Interface scoring section in section

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

II.E.6.a.(2)(g)(ii), we are not scoring measures that lack a benchmark or are below case minimum if the measure meets data completeness criteria.

Comment: Several commenters supported our proposal to use the top six scored measures.

Response: We appreciate the support and we are finalizing the proposal to score the top six scored measures for all submission mechanisms except CMS Web Interface. The required number of measures for CMS Web Interface is discussed in section II.E.5.b.(3)(a)(ii) of this final rule with comment period.

Comment: One commenter disagreed with the ability to report more than 6 measures because not all groups had the same option to report additional measures given the availability of measures.

Response: With the exception of the CMS Web Interface submission mechanism (other than the CAHPS for MIPS survey), groups are allowed to report additional measures. We note that groups, outside of the MIPS APM scoring standard, have the option to choose whether they will report via the CMS Web Interface or another submission mechanism. With regard to the availability of measures, we will continue to monitor trends to identify areas where further measure development is needed.

After consideration of the comments, we are finalizing our policy at §414.1380(b)(1)(xv) to calculate the quality performance category score as proposed. We will sum the points assigned for the measures required by the quality performance category criteria plus the bonus points and divide by the weighted sum of total possible points. The quality performance category score cannot exceed the total possible points for the quality performance category. If a MIPS eligible clinician elects to report more than the minimum number of measures to meet the MIPS quality performance category criteria, then we will only include the scores for the measures with

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the highest number of assigned points, once the first outcome measure is scored, or if an outcome measure is not available, once another high priority measure is scored.

We are finalizing our proposal that if a MIPS eligible clinician does not have any scored measures, then a quality performance category score will not be calculated. However, we also note that during the transition year, with the implementation of the 3-point floor for class 2 measures as described in Table 17 that all MIPS eligible clinicians who are non-CMS Web Interface users, that submit some quality data will have a quality performance category score in year 1 of MIPS. The MIPS eligible clinician will receive:

- 3 points for submitted measures that do not meet the minimum case size, do not have a benchmark or do not meet data completeness criteria, even if the measure is reported with a 0 percent performance rate.

- 3 points or more for submitted or calculated measures that meet the minimum case size, have a benchmark and meet data completeness criteria, even if the measure is reported with a 0 percent performance rate.

However, as we will illustrate below, because we have changed the performance standards, submission criteria, and other scoring elements, we believe the scoring system will be simpler to understand and that it will reduce burden on MIPS eligible clinicians trying to achieve a higher quality performance category score. Thus, based on public comments, we are adjusting multiple parts of our proposed scoring approach to ensure that we do not unfairly penalize MIPS eligible clinicians who have not had time to prepare adequately to succeed under our proposed approach while still rewarding high performers.

For example, we are no longer requiring a cross-cutting measure for patient facing MIPS eligible clinicians, as discussed in section II.E.5.(b)(3) of this final rule with comment period.

Additionally, we are no longer requiring two of the 3 population health measures and are only

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

requiring the all-cause hospital readmission measure for groups of 16 or more clinicians instead of our proposed approach of groups of 10 or more, assuming the case minimum of 200 cases has been met, as discussed in section II.E.5.b.(6) of this final rule with comment period. If the case minimum of 200 cases has not been met, we will not score this measure. Thus, the MIPS eligible clinician will not receive a zero for this measure, but rather this measure will not apply to the MIPS eligible clinician's quality performance category score.

We also note that if a group of 16 or more, does not report any quality performance category data, the group would be scored on the all-cause readmission measure (assuming the group meets the readmission measure minimum case size requirements) even if they did not submit any other quality performance category measures if they submitted information in other performance categories. If a group of 16 or more did not report any information in any of the performance categories, then the readmission measure would not be scored.

We are now capping both the high priority bonus and the CEHRT bonus at 10 percent instead of 5 percent of the denominator of the quality performance category score. Further, all measures reported can now be scored with a floor of 3 points even if the measure is below the case minimum, lacks a benchmark or is below the completeness requirement. We believe that all of these modified elements, when combined, will significantly increase participation in the MIPS, will reduce burden and confusion on MIPS eligible clinicians and will allow MIPS eligible clinicians to gain experience under the MIPS while penalties are smaller in nature.

For example, a MIPS eligible clinician who is in a group of 20 practitioners that reports as a group, and reports 4 quality measures instead of the required 6 measures. Of the 4 measures submitted, which include an outcome measure, each measure has a performance rate that is low. The clinician is also scored on an additional measure, the all-cause hospital readmission measure, but has a poor performance rate on this measure as well. Under this revised scoring

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

approach, we allow all MIPS eligible clinicians who submit quality measures to receive a 3-point floor per measure in the quality performance category. Under this scenario, the MIPS eligible clinician receives the 3-point floor for each of the 4 submitted measures and the all-cause hospital readmission measure. The MIPS eligible clinician's quality performance category weighted score is calculated as follows: 5 measures x 3 points each /total possible points of 70 points x (quality performance category weight of 60) =12.9 points towards the final score.

In another example, a MIPS eligible clinician who is a solo practitioner reports all 6 measures, including an outcome measure, although all are below the required case minimum. The eligible clinician receives a floor of 3 points for all 6 measures in the quality performance category even though the measures are below the 20 case size minimum. Under this scenario, the MIPS eligible clinician's quality performance category weighted score is calculated as follows: 6 measures x 3 points each /total possible points of 60 points x (quality performance category weight of 60), or  $18/60 \times 60 = 18$  points towards the final score. We note that we did not include the all-cause hospital readmissions measure in the above quality performance category calculation since it is not applicable to groups of 15 or fewer clinicians and solo practitioners and MIPS individual reporters due to reliability concerns.

In another example, a MIPS eligible clinician is in a group of 25 that reports as a group via registry 3 process measures, 1 outcome measure, 1 other high priority (for example, patient safety) measure and 1 process measure that is below the case minimum requirement. Two of the process measures and one outcome measure qualify for the CEHRT bonus. Measures that do not meet the required case minimum or do not have a benchmark or fall below the data completeness requirement will be given 3 points. We emphasize that these measures are treated differently than a required measure that is not reported. Any required measure that is not reported would receive a score of zero points and be considered a scored measure. Table 19 illustrates the

**TABLE 19: Quality Performance Category Example with High Priority and CEHRT Bonus Points**

Measure	Measure Type	Number of Cases	Points Based on Performance	Total Possible Points	Quality Bonus Points For High Priority	Quality Bonus Points for CEHRT
Measure 1	Outcome Measure using CEHRT	20	4.1	10	0 (required)	1
Measure 2	Process using CEHRT	21	9.3	10	N/A	1
Measure 3	Process using CEHRT	22	10	10	N/A	1
Measure 4	Process	50	10	10	N/A	N/A
Measure 5	High Priority (Patient Safety)	43	8.5	10	1	N/A
Measure 6	Process below case minimum	10	3	10	N/A	N/A
All-Cause Hospital Readmission	Claims	205	5	10	N/A	N/A
Total Points	All Measures	N/A	49.9	70	1	3

The total possible points for the MIPS eligible clinician is 70 points. The eligible clinician has 49.9 points based on performance. The MIPS eligible clinician also qualifies for 1 bonus point for reporting an additional high priority patient safety measure and 3 bonus points for end-to-end electronic reporting of quality measures. The bonus points for high priority measures and CEHRT reporting are subject to two separate caps, which are each 10 percent of 70 possible points or 7 points. The quality performance category score for this MIPS eligible clinician is  $(49.9 \text{ points} + 4 \text{ bonus points} = 53.9) / 70 \text{ total possible points} \times 60 \text{ (quality performance category weight)} = 46.2 \text{ points}$  towards the final score. The quality performance category score would be capped at 100 percent.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The example in Table 20 illustrates how to calculate the bonus cap for the high priority measure bonus and the CEHRT bonus. In this scenario, the MIPS eligible clinician is a solo practitioner who has submitted 6 measures, as an individual, all above the case minimum requirement. Since the MIPS eligible clinician is a solo practitioner, the all-cause hospital readmission measure does not apply. The MIPS eligible clinician below successfully submitted six quality measures using end-to-end electronic reporting, and therefore, qualifies for the CEHRT bonus of one point for each of those measures. In addition to CEHRT bonus points, the MIPS eligible clinician reported 4 outcome measures (6 bonus points), a patient experience measure (2 bonus points) and a care coordination measure (1 bonus point) for 9 total high priority bonus points. The MIPS eligible clinician receives 2 bonus points for the second, third and fourth outcome measures, given that no bonus points are given for the first required measure. However, the number of high priority measure bonus points (9 points) is over the cap (which is 10 percent of 60 possible points or 6 points), and the number of CEHRT bonus points (6 points) is at the cap (which is 10 percent of 60 possible points or six points). The quality performance category score for this MIPS eligible clinician is  $50.8 + 6 \text{ CEHRT bonus points} + 6 \text{ high priority bonus points} / 60 \text{ points} = 62.8 / 60$  or 100 percent since the overall number of points is capped at 60 or 100 percent score. Note, in section II.E.5.b.(2) of this final rule with comment period, we proposed to weight the quality performance category at 60 percent of the MIPS final score, so a 100 percent quality performance category score would account for 60 percent of the final score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 20: Quality Performance Category Bonus Cap Example**

Measure	Measure Type	Points Based on Performance	Total Possible Points	Quality Bonus Points For High Priority	Quality Bonus Points for CEHRT
Measure 1	Outcome Measure using CEHRT	4.1	10	0 (required)	1
Measure 2	Outcome Measure using CEHRT	9.3	10	2	1
Measure 3	Patient Experience using CEHRT	10	10	2	1
Measure 4	High Priority (Care Coordination) measure using CEHRT	10	10	1	1
Measure 5	Outcome measure using CEHRT	9	10	2	1
Measure 6	Outcome measure using CEHRT	8.4	10	2	1
Total		50.8	60	9	6
Cap applied to Bonus Categories 10% x total possible points to calculate the high priority bonus cap and 10% x total possible points to calculate the CEHRT bonus cap				6	6
Total with high priority and CEHRT Bonus		60 (given we cap the quality performance category score at 60)			

(ii) Calculating the Quality Performance Category for CMS Web Interface Reporters

CMS Web Interface reporters have different quality performance category submission criteria; therefore, we proposed to modify our scoring logic slightly to accommodate this submission mechanism. CMS Web Interface users report on the entire set of measures specified for that mechanism. Therefore, rather than scoring the top six reported measures, we proposed to score all measures. If a group does not meet the reporting requirements for one of the measures, then the group would receive 0 points for that measure. We note that since groups reporting through the CMS Web Interface are required to report on all measures, and since some of those

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures are “high priority,” these groups would always have some bonus points for the quality performance category score if all the measures are reported. That is, the group would either report on less than all CMS Web Interface measures, in which case the group would receive zeroes for unreported measures, or the group would report on all measures, in which case the group would automatically be eligible for bonus points. The other proposals for scoring discussed in section II.E.6.a.2.(g)(i) of the proposed rule, including bonus points, would still apply for CMS Web Interface. We requested comment on this proposal.

The following is a summary of the comments we received regarding our proposal to score CMS Web Interface.

Comment: Some commenters requested that we apply the policy of scoring only the six highest scoring measures to the CMS Web Interface.

Response: For other submission mechanisms, MIPS eligible clinicians are required to report 6 measures; therefore, we are scoring 6 required measures. In contrast, in the transition year, the CMS Web Interface reporters are required to report 13 individual measures, and a 2-component diabetes composite measure. We believe it would be appropriate to score all the required measures. However, we note that 3 measures do not have a benchmark in the Shared Saving Program; therefore, we will only score those measures with a benchmark. For the transition year, measures with a benchmark include 10 individual measures and the 2-component diabetes composite measure for a total of 11 measures with benchmarks. CMS Web Interface reporters are required to report on more than 6 measures; they are required to report on 13 individual measures and the 2-component diabetes composite measure, but are only scored in the transition year on 11 (10 individual measures and the 2-component diabetes composite measure) of the total 14 required measures given that only 11 measures have a benchmark. Therefore, we believe we have a comparable number of measures scored in CMS Web Interface (11 measures

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

with benchmarks) compared to other reporting mechanisms (6 measures). In addition, we think this policy to not score measures without a benchmark is consistent with Shared Savings Program and NextGen ACO programs which do not measure performance on selected measures. Table 21 shows the number of CMS Web Interface measures and indicates which have benchmarks and which are high priority measures that would be eligible for bonus points. The first required outcome measure would not receive bonus points. For the two-component diabetes composite measure, both components of the measure would need to be submitted to qualify as a high priority measure.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 21: Finalized Quality Measures Available for MIPS Web Interface Reporting in 2017**

Count	NQF/Q #	ACO #	Measure Title & Description	High Priority Designation	2017 Shared Savings Program Benchmark (Yes/No)
1	0059/001  0055/117	ACO-27  ACO-41	<b>2- Component Diabetes Composite Measure: Diabetes: Hemoglobin A1c (HbA1c) Poor Control (&gt;9%):</b> Percentage of patients 18-75 years of age with diabetes who had hemoglobin A1c > 9.0% during the measurement period. <b>Diabetes: Eye Exam:</b> Percentage of patients 18 - 75 years of age with diabetes who had a retinal or dilated eye exam by an eye care professional during the measurement period or a negative retinal or dilated eye exam (no evidence of retinopathy) in the 12 months prior to the measurement period.	*	Yes, diabetes composite benchmark only
2	0097/046	ACO-12	<b>Medication Reconciliation Post-Discharge:</b> The percentage of discharges from any inpatient facility (e.g. hospital, skilled nursing facility, or rehabilitation facility) for patients 18 years and older of age seen within 30 days following discharge in the office by the physician, prescribing practitioner, registered nurse, or clinical pharmacist providing on-going care for whom the discharge medication list was reconciled with the current medication list in the outpatient medical record. This measure is reported as three rates stratified by age group: • Reporting Criteria 1: 18-64 years of age • Reporting Criteria 2: 65 years and older • Total Rate: All patients 18 years of age and older.	*	No
3	0041/110	ACO-14	<b>Preventive Care and Screening: Influenza Immunization:</b> Percentage of patients aged 6 months and older seen for a visit between October 1 and March 31 who received an influenza immunization OR who reported previous receipt of an influenza immunization.		Yes
4	0043/111	ACO-15	<b>Pneumonia Vaccination Status for Older Adults:</b> Percentage of patients 65 years of age and older who have ever received a pneumococcal vaccine.		Yes
5	2372/112	ACO-20	<b>Breast Cancer Screening:</b> Percentage of women 50 through 74 years of age who had a mammogram to screen for breast cancer.		Yes
6	0034/113	ACO-19	<b>Colorectal Cancer Screening:</b> Percentage of patients 50 - 75 years of age who had appropriate		Yes

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. 			screening for colorectal cancer.		
7	0421/128	ACO-16	<b>Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan:</b> Percentage of patients aged 18 years and older with a BMI documented during the current encounter or during the previous six months AND with a BMI outside of normal parameters, a follow-up plan is documented during the encounter or during the previous six months of the current encounter  Normal Parameters: Age 18 – 64 years BMI $\geq$ 18.5 and $<$ 25 kg/m <sup>2</sup> .		Yes
8	0418/134	ACO-18	<b>Preventive Care and Screening: Screening for Depression and Follow-Up Plan:</b> Percentage of patients aged 12 years and older screened for depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen.		Yes
9	0068/204	ACO-30	<b>Ischemic (IVD): Use of Aspirin or Another Antiplatelet:</b> Percentage of patients 18 years of age and older who were diagnosed with acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI) in the 12 months prior to the measurement period, or who had an active diagnosis of ischemic vascular disease (IVD) during the measurement period and who had documentation of use of aspirin or another antiplatelet during the measurement period.		Yes
10	0028/226	ACO-17	<b>Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention:</b> Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation counseling intervention if identified as a tobacco user.		Yes
11	0018/236	ACO-28	<b>Controlling High Blood Pressure:</b> Percentage of patients 18-85 years of age who had a diagnosis of hypertension and whose blood pressure was adequately controlled ( $<$ 140/90 mmHg) during the measurement period.	*	Yes
12	0101/318	ACO-13	<b>Falls: Screening for Fall Risk:</b> Percentage of patients 65 years of age and older who were screened for future fall risk at least once during the measurement period.	*	Yes
13	0710/370	ACO-40	<b>Depression Remission at Twelve Months:</b> Patients age 18 and older with major depression	*	No

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

			or dysthymia and an initial Patient Health Questionnaire (PHQ-9) score greater than nine who demonstrate remission at twelve months (+/- 30 days) after an index visit defined as a PHQ-9 score less than five. This measure applies to both patients with newly diagnosed and existing depression whose current PHQ-9 score indicates a need for treatment.		
14	N/A/438	ACO-42	<p><b>Statin Therapy for the Prevention and Treatment of Cardiovascular Disease:</b>                      Percentage of the following patients—all considered at high risk of cardiovascular events—who were prescribed or were on statin therapy during the measurement period:</p> <ul style="list-style-type: none"> <li>• Adults aged ≥ 21 years who were previously diagnosed with or currently have an active diagnosis of clinical atherosclerotic cardiovascular disease (ASCVD); OR</li> <li>• Adults aged ≥21 years with a fasting or direct low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL; OR</li> <li>• Adults aged 40-75 years with a diagnosis of diabetes with a fasting or direct LDL-C level of 70-189 mg/dL</li> </ul>		No

Note: High priority measures are noted with an asterisk (\*).

Comment: One commenter opposed the approach in which groups not able to report on all measures would receive a score of zero for omitting measures, as it limits the use of this technology.

Response: Section 1848(q)(5)(B)(i) of the Act requires us to give the lowest possible score to a MIPS eligible clinician that fails to report a required measure or activity. As all measures in the CMS Web Interface are required to be submitted, we have to score zeros for those who do not report.

Comment: Commenter recommended that CMS give extra points when specialists utilizing the CMS Web Interface participate in specialty registries.

Response: We offer CMS Web Interface users the ability to receive bonus points for reporting more than one high priority measure and for end-to-end electronic reporting. We did

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not propose to offer bonuses for participation in specialty registries. We do not think it is appropriate to offer a special bonus for one particular submission mechanism; however, if we revisit the issue of new bonus point categories in the future, we would do so through proposed rulemaking in future years.

After considering all comments, we are finalizing our policy as proposed with regard to scoring CMS Web Interface measures for all elements except for the following scenarios.

We also highlight that unless otherwise noted, this section on CMS Web Interface scoring will not apply to clinicians participating in an APM Entity scored through the APM scoring standard. APM Entity group reporting and scoring for MIPS eligible clinicians participating in MIPS APMs are summarized in section II.E.5.h. of this final rule with comment period. All eligible clinicians that participate in APMs are considered MIPS eligible clinicians unless and until they are determined to be either QPs or Partial QPs who elect not to report under MIPS, and are excluded from MIPS, or unless another MIPS exclusion applies.

We are finalizing the following modifications for our CMS Web Interface scoring policies. First, we will be providing a global floor of 3 points for all CMS Web Interface measures submitted in the transition year, even with measures at 0 percent performance rate, assuming that these measures have met the data completeness criteria, have a benchmark and meet the case minimum requirements. However, measures with performance below the 30th percentile will be assigned a value of 3 points during the transition year to be consistent with the floor established in this rule for other measures and because the Shared Savings Program does not publish benchmarks below the 30<sup>th</sup> percentile. We will reassess scoring for measures below the 30<sup>th</sup> percentile in future years. Table 22 illustrates how the decile score works for Shared Saving Program benchmarks. For example, a performance rate of 9.6 percent (below 30<sup>th</sup> percentile), would receive 3.0 points. This methodology will not affect the scoring for MIPS

eligible clinicians with performance in the third decile or higher. In addition, this methodology will not affect the calculation of future benchmarks.

**TABLE 22: Example of Using Shared Saving Program Benchmarks\* for a Single Measure to Assign Points with a Global Floor of 3 Points**

Benchmark Decile	Sample Quality Measure Benchmarks for Web Interface	Possible Points with 3-Point Floor
Benchmark Deciles 1-3 (starts at 0 and ends before the 30 <sup>th</sup> percentile)	N/A	3.0
Benchmark Decile 4 (starts at the 30 <sup>th</sup> percentile)	23.0-35.9%	4.0-4.9
Benchmark Decile 5	36.0-40.9%	5.0-5.9
Benchmark Decile 6	41.0-61.9%	6.0-6.9
Benchmark Decile 7	62.0-68.9%	7.0-7.9
Benchmark Decile 8	69.0-78.9%	8.0-8.9
Benchmark Decile 9	79.0-84.9%	9.0-9.9
Benchmark Decile 10	85.0%-100%	10

\*Data is illustrative and does not represent an actual Shared Savings Program Benchmark.

We will not score CMS Web Interface measures that do not meet the case minimum requirement or lack a benchmark unless that measure is not submitted. We believe that this policy is appropriate since, unlike with non-CMS Web Interface users where MIPS eligible clinicians can report additional measures beyond the required six to ensure that there are sufficient measures to be scored on performance, CMS Web Interface users are limited to reporting the 14 measures (13 individual measures and the 2-component diabetes composite measure) listed in Table 21. Given that these CMS Web Interface users cannot report additional measures in instances where a measure does not have a benchmark or is below the case minimum, we have decided not to score these measures.

However, measures that are not reported and measures reported below the data completeness requirements will receive a 0 score. We have decided to give a zero to measures that are below the data completeness requirements for CMS Web Interface users because we believe that these users generally have more experience in reporting measures than the non-CMS Web Interface users and therefore should not have any challenges in meeting the data completeness criteria. Table 23 summarizes the scoring approach for Web Interface and Non-

**TABLE 23: Comparison of Scoring Approach of Web Interface and Non-Web Interface Measures**

<b>Data completeness, with/without case minimum criteria met/benchmark</b>	<b>Range of possible scores per measure for non-CMS Web Interface users</b>	<b>Range possible scores per measure for CMS Web Interface Users</b>
No measures reported regardless of case minimum criteria met	0	0
No measures reported regardless of whether there is a benchmark	0	0
Partial data (below data completeness criteria requirement) without case minimum criteria met, regardless of whether the measure is at 0% performance rate or not	3	0
Partial data (below data completeness criteria requirement) without a benchmark, regardless of whether the measure is at 0% performance rate or not	3	0
Complete data (data completeness criteria met) without case minimum criteria met, regardless of whether the measure is at 0% performance rate or not	3	Null: The measures will not be scored
Complete data (data completeness criteria met) without a benchmark, regardless of whether the measure is at 0% performance rate or not	3	Null: The measure will not be scored
Complete data (data completeness criteria met) with case minimum criteria met, the measure has a benchmark, and the measure is at 0% performance rate	3	3
Complete data (data completeness criteria met) with case minimum criteria met, the measure has a benchmark, and the performance rate is greater than 0% performance rate**	3–10	3–10*

\* SSP benchmark's start at the 30<sup>th</sup> percentile

\*\* Given the global 3-point floor for low performance, a measure that would have received 1 point or 2 points will now receive a score of 3 points.

We provide in Table 24 examples of this scoring approach. For example, for each measure that lacks a benchmark that is not reported, a zero will be added to the numerator and 10 points will be added to the denominator. This is because normally these measures are not scored but since these measures were not reported, the group will be penalized with a lower quality performance category score accordingly. For each measure that does not lack a benchmark that is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not reported, then a zero will be added to the numerator but no points will be added to the denominator since these measures are normally scored so the denominator is static. We are finalizing the policy to score measures with benchmarks because CMS Web Interface reporters have to report on more than 6 measures, so we believe we have a comparable number of measures compared to other reporting mechanisms. In addition, we believe this policy to not score measures without a benchmark is consistent with Shared Savings Program and NextGen ACO programs which do not measure performance on selected measures.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 24: Scoring Examples: Groups Reporting via Web Interface with the Readmission Measure\***

<b>Examples</b>	<b>Reported 14 measures Yes/No</b>	<b>Number of measures Not Reported</b>	<b>Number of measures not scored**</b>	<b>Quality Performance Category Numerator/Denominator (Assume all measures reported received 10 points and the score for the readmission measure* is 3 points)</b>	<b>Quality Performance Category Score Numerator/Denominator x (weight of quality performance category of 60) = Points Toward the Final Score</b>
Reported 14 measures	Yes	N/A	3	11 measures x 10 points + 1 measure x 3 points/120	113/120 x 60=56.5
Reported 11 measures, did not report 3 measures without a benchmark	No	3 measures lacking a benchmark	0	11 measures x 10 points +1 measure x 3 points/150	113/150 x 60=45.2
Reported 13 measures, did not report measure with a benchmark	No	1 measure with a benchmark	3	10 measures x 10 points +1 measure x 3 points/120	103/120 x 60=51.5

Note: \*For CMS Web Interface groups without sufficient volume for the readmissions measure (below the 200 case minimum), as well as Shared Saving Program and NextGen ACOs, the readmission measure will not be scored.

\*\*Measures are not scored if the measure is reported but the case minimum criteria is not met or if the measure lacks a benchmark.

**(h) Measuring Improvement**

Section 1848(q)(3)(B) of the Act requires the Secretary, in establishing performance standards for measures and activities for the MIPS performance categories, to consider: historical performance standards; improvement; and the opportunity for continued improvement. In addition, under section 1848(q)(5)(D) of the Act, beginning with the second year of the MIPS, if data sufficient to measure improvement are available, the final score methodology shall take into account improvement of the MIPS eligible clinician in calculating the performance score for the quality and cost performance categories and may take into account improvement for the improvement activities and advancing care information performance categories.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We solicited public comments on potential ways to incorporate improvement into the scoring methodology moving forward. We were especially interested in feedback on the following three options, with the assumption that eligible clinicians would report the same measures year-to-year (where possible). We were also interested in feedback on how to score improvement given that a MIPS eligible clinician can change measures and submission mechanisms from year-to-year. In addition, a MIPS eligible clinician can elect to report as an individual or a member of a group and that election can vary from year to year. Finally, we sought feedback on whether to score improvement where MIPS eligible clinicians do not have the required case minimum for measures to be scored.

Option 1: In the proposed rule, we presented an option in which we could adopt the approach for assessing improvement currently used for the HVBP, where we assign from 1-10 points for achievement and from 1-9 points for improvement for each measure. We would compare the achievement and improvement points for each measure in the quality performance category and score whichever is greater. Specifically, we would determine two scores for a MIPS eligible clinician at the measure level for the quality performance category. First, we would assess the MIPS eligible clinician's achievement score, which measures how the MIPS eligible clinician performed compared to benchmark performance scores for each applicable measure in the quality performance category. Second, we would assess the MIPS eligible clinician's improvement score, which measures how much a MIPS eligible clinician has improved compared to the MIPS eligible clinician's own previous performance during a baseline period for each applicable measure in the quality performance category. Under this methodology, we would compare the achievement and improvement scores for each measure and only use whichever is greater, but only those eligible clinicians with the top achievement would be able to receive the maximum number of points. If a MIPS eligible clinician's practice was not open

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

during the baseline period but was open during the performance period, points would be awarded based on achievement only for that performance period. For a more detailed description of the Hospital VBP Program methodology, we refer readers to §412.160 and §412.165.

Option 2: In the proposed rule, we presented an option where we could adopt the approach for assessing improvement currently used in the Shared Savings Program, where MIPS eligible clinicians or groups would receive a certain number of bonus points for the quality performance category for improvement, although the total points received for the performance may not exceed the maximum total points for the performance category in the absence of the quality improvement points. Under this methodology, we would score individual measures and determine the corresponding number of points that may be earned based on the MIPS eligible clinician's performance. We would add the points earned for the individual measures within the quality performance category and divide by the total points available for the performance category to determine the quality performance category score. MIPS eligible clinicians that demonstrate quality improvement on established quality measures from year-to-year would be eligible for up to 4 bonus points for the quality performance category. Bonus points would be awarded based on a MIPS eligible clinician's net improvement in measures within the quality performance category, which would be calculated by determining the total number of significantly improved measures and subtracting the total number of significantly declined measures. Up to 4 bonus points would be awarded based on a comparison of the MIPS eligible clinician's net improvement in performance on the measures to the total number of individual measures in the quality performance category. When bonus points are added to points earned for the quality measures in the quality performance category, the total points received for the quality performance category may not exceed the maximum total points for the performance category in the absence of the quality improvement points. For a more detailed description of the Shared

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. Savings Program methodology, we refer readers to §425.502, as well as CY 2015 PFS final rule with comment period (79 FR 67928 - 67931) for a discussion of how CMS will determine whether the improvement or decline is significant.

Option 3: In the proposed rule, we presented an option where we could adopt the approach similar to that for assessing improvement for the Medicare Advantage 5-star rating methodology. Under this approach, we would identify an overall “improvement measure score” by comparing the underlying numeric data for measures from the prior year with the data from measures for the performance period. To obtain an “improvement measure score” MIPS eligible clinicians would need to have data for both years in at least half of the required measures for the quality performance category. The numerator for the overall “improvement measure” would be the net improvement, which is a sum of the number of significantly improved measures minus the number of significantly declined measures. The denominator is the number of measures eligible for improvement since to qualify for use in the “improvement measure” calculation, a measure must exist in both years and not have had a significant change in its specification. This “improvement measure” would be included in the quality performance category. We recognize that high performing MIPS eligible clinicians may have less room for improvement and consequently may have lower scores on the overall “improvement measure”. Therefore, under this option we would apply the following rule, which is similar to how the Medicare Advantage 5-star rating methodology treats highly rated plans within the Medicare Star Quality Rating System, in connection with the improvement measure to avoid penalizing consistently high-performing eligible clinicians: we would calculate a MIPS eligible clinician’s score with the “improvement measure” and without, and use the MIPS eligible clinician’s best score. We requested comments on these proposals.

Comment: Numerous commenters wrote in support of Options 1, 2, and 3, with the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

majority supporting Option 1. Those who supported Option 1 recognized that this approach presented challenges if the clinician changes measures from year to year or changes between group and individual reporting. One commenter was concerned about improvement points for year 2, where a clinic performing highly would not be able to receive as many points as another lower performing clinic even though both had improved. One commenter expressed concern with how CMS intends to measure and score quality improvement in the years following the first performance period. In particular, this commenter sought clarity on scoring process measures versus outcome measures. The commenter requested that specific examples of how each measure will be scored be included in the final rule with comment period. One commenter requested that CMS release an RFI outlining the three options in detail before finalizing any proposal. Another commenter recommended postponing measuring improvement and instead focusing on a successful MIPS launch. Another commenter cautioned that no methodology should be finalized without testing and significant outreach to, and input from the medical community to ensure clinicians understand and trust what they are being scored on. One commenter recommended that CMS determine the feasibility for each of the 3 proposed strategies. The concern is that due to fluidity of physician groups, payment adjustment applied 2 years later may never reach the physicians that earned it. This is due to the physician leaving their group. Also if a physician achieves success and moves to a lower performing group they will be penalized. This commenter recommended not committing to a single approach in incorporating improvements into MIPS scores.

Response: We thank commenters for their feedback. We are not finalizing any policies related to improvement in this rule, but will consider comments for future rulemaking.

Comment: One commenter recommended measuring improvement in advancing care information and cost. One commenter suggested that all Shared Savings Program participants

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for which CY 2015 was their first year of ACO participation be able to choose the timeline that becomes the baseline for their performance improvement score as these providers were only being evaluated on reporting and not performance, and to use CY 2015 for the baseline would be misleading. Commenter strongly believed that CMS should work on securing a successful launch of the program and encouraging participation before it begins to evaluate future improvement. One commenter supported CMS' proposals to reward improvement.

Response: We are open to measuring improvement for all performance categories. We are not finalizing any policies related to improvement in this rule, but will consider comments for future rulemaking.

Comment: One commenter expressed concern that practices that are high performers may be penalized because they do not have the opportunity for large increases in performance.

Response: We note that we are required to measure achievement, and in addition to measuring achievement, may measure improvement in Year 2, if data sufficient to measure improvement is available. MIPS eligible clinicians will not be penalized if they are high performers.

We appreciate the comments regarding the three proposed options to score improvement; however, we are not proposing an approach for scoring improvement at this time. We will consider these comments and outline a proposal in future rulemaking.

### (3) Scoring the Cost Performance Category

As we described in the proposed rule (81 FR 28259), we proposed to align scoring across the MIPS performance categories. For the cost performance category, we proposed to score the cost measures similarly to the quality performance category. Specifically, we proposed at §414.1380(b)(2) to assign one to ten points to each cost measure based on a MIPS eligible clinician's performance compared to a benchmark (81 FR 28260). However, we proposed that for the cost performance category (unlike the quality performance category), the benchmark would be based on the performance period, rather than the baseline period. The details of the scoring for cost measures are described below.

#### (a) Cost Measure Benchmarks

For the cost performance category, we proposed at §414.1380(b)(2) that the performance standard is measure-specific benchmarks (81 FR 28259). We would calculate an array of measure benchmarks based on performance. Then, a MIPS eligible clinician's actual performance on the cost measure during the performance period would be evaluated to determine the number of points that should be assigned based on where the clinician's actual performance falls within these benchmarks.

We proposed at §414.1380(b)(2) to create benchmarks for the cost measures based on the performance period (81 FR 28260). Changes in payment policies, including changes in relative value units, and changes that affect how hospitals, clinicians and other health care providers are paid under Medicare Parts A and B, can make it challenging to compare performance on cost measures in a performance period with a historical baseline period. In addition, for the Hospital VBP Program and the VM, we use the performance period to establish the benchmarks for scoring Hospital VBP Program's efficiency measures and the VM's cost measures (80 FR 49562, 80 FR 71280). We proposed that if we use the performance period, we would publish the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

benchmark methodology in a final rule, but would not be able to publish the actual numerical benchmarks in advance of the performance period. We stated we believe that it is important for MIPS eligible clinicians to know in advance how they might be scored so we would continue to provide performance feedback with information on the MIPS eligible clinician's relative performance.

We considered an alternative to base the cost performance category measure benchmarks on the baseline period proposed rather than the performance period (81 FR 28259). This option would further align the cost performance category benchmark methodology with the quality performance category benchmark methodology. This option would also allow us to publish the numerical benchmarks before the performance period ends; however, we believe the benefits of earlier published benchmarks are more limited for cost measures. MIPS eligible clinicians would not be able to track their daily progress because they would not have all the necessary information to determine the attribution, price standardization, and other adjustments to the measures. We believe the relative performance that we provide through performance feedback would provide MIPS eligible clinicians the information they need to track performance and to learn about their resource utilization. In addition, we believe that using benchmarks based in the performance period is a better approach than using benchmarks based in the baseline period because different payment policies could apply during the baseline period than during the performance period which could affect the cost of care for patients treated by MIPS eligible clinicians. We would also have to identify the baseline benchmark and trend it forward so that the dollars in the baseline period are comparable to the performance period, whereas we would not have to make a trending adjustment for benchmarks based on the performance period. For these reasons, we elected to propose to base the benchmarks on the performance period rather than the baseline period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We proposed to create a single set of benchmarks for each measure specified for the cost performance category. We proposed that all MIPS eligible clinicians that are attributed sufficient cases for the measure would be included in the same benchmark. In addition, we proposed that a minimum of 20 MIPS eligible clinicians or groups must be attributed the case minimum in order to develop the benchmark. If a measure does not have enough MIPS eligible clinicians or groups that are attributed enough cases to create a benchmark, then we proposed not including that measure in the scoring for the cost performance category.

We requested comment on the proposal to establish cost measure benchmarks based on the performance period as well as the alternative proposal.

The following is a summary of the comments we received regarding our proposals on the benchmarking of cost measures:

Comment: Several commenters supported our proposal to benchmark cost measures on the performance period, noting that clinicians do not have control of the payment rate for individual services and could be subject to inappropriate adjustments to payments if a previous year was used as a benchmark.

Response: We agree with commenters and will be finalizing our proposal at §414.1380(b)(2)(i) to establish cost measure benchmarks based on the performance period. As discussed further below, cost measures must have a benchmark to be scored.

Comment: A number of commenters opposed our proposal to benchmark cost measures on the basis of the performance period and instead supported our alternative proposal to benchmark cost measures on the basis of a previous year. These commenters supported the alternative benchmarking proposal because they believed it would support alignment with the benchmarking period used for quality scoring, allow clinicians to be aware of cost targets in advance, and be more consistent with the approach used in the Medicare Shared Savings

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Program. A few commenters recommended using regional trend factors, similar to the Shared Savings Program, to update historical data. Some commenters suggested a benchmark period that was less than a year.

Response: For quality measurement, we believe that providing a benchmark from previous years provides a helpful target that can support the overall goal of improvement. However, we believe that cost measures have important differences that make using a previous year as a benchmark period problematic, such as changes in Medicare payment policies over time and the development of new therapies and technology. We will continue to provide feedback to clinicians on the cost of care associated with cost measures to which they would have patients attributed and believe that this will be helpful information as they address potential improvements to make in future years. Because we are using performance period data, not historical data, we do not require a trend factor to update the benchmark. We believe that benchmarking to a period of less than 1 year could reduce the reliability of our measures. By benchmarking to the current performance period, we are not making clinicians responsible for differences in costs of care that occur as a result of changes in payment policy over time.

Comment: Some commenters opposed our proposal to establish a single national benchmark for each cost measure and instead recommended that clinicians only be compared to those that practice in the same specialty, subspecialty, or region of the country, or which have a similar practice sizes or mix of patients.

Response: The measures used within the cost performance category are constructed to identify the differences in patients as much as possible as opposed to the different specialties of the individual clinicians. We considered the option of peer compatibility grouping during the development of the VM. At that time, we found that there were difficulties in defining which groups were similar enough to be considered peers. We believe that this difficulty is increased

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

by attributing patients to individual clinicians as identified by TIN/NPI rather than TINs as in the VM. We will continue to use a specialty adjustment for the total per capita cost measure to accommodate the different circumstances by which patients are often treated by specialists but will not otherwise adjust or limit comparison based on the specialty of the clinician. In section II.E.5.e.(3) of this final rule with comment period, we provide additional responses on comparing cost measures based on other characteristics based on practice size or the types of patients served.

We also believe that it is appropriate to have a national versus regional benchmark. The cost measures are price standardized to remove geographic adjustments such as wage indices and cost of living adjustments, so that measures would reflect the same payment rate for a particular service regardless of the region in which it is provided. Other CMS performance programs such as VM and HVBP use national benchmarks and we believe it is appropriate to continue that policy for MIPS. After considering the comments, we are finalizing our proposals at §414.1380(b)(2) to establish a single benchmark for each cost measure and to base those benchmarks on the performance period. We are finalizing the methodology proposed at §414.1380(b)(2) to assign one to ten points to each cost measure attributed to the MIPS eligible clinician based on the MIPS eligible clinician's performance compared to the measure benchmark. Because we are basing the benchmarks on the performance period, we will not be able to publish the actual numerical benchmarks in advance of the performance period, as indicated in the proposed rule (81 FR 28259).

While we understand there are some opportunities associated with benchmarking to a previous year, we believe they are overwhelmed by the disadvantages. This is particularly true as we continue to develop episode-based measures in which the development of a new technology or a change in payment policy could result in a significant change in typical cost of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

care from year to year. This could potentially result in the majority of clinicians being found to perform well above or well below the benchmark, even if they did not change their practice patterns in relation to their peers. While we did not receive any comments on our proposal to only develop a benchmark for a measure if a minimum 20 MIPS eligible clinicians or groups are attributed the case minimum, we are finalizing that proposal incorporating the changes made to the attribution methodology used for cost measures discussed in II.E.5.e.(3) of this final rule with comment period. We will develop a benchmark for a measure only if at least 20 groups (for those MIPS eligible clinicians participating in MIPS as a group practice) or TIN/NPI combinations (for those MIPS eligible clinicians participating in MIPS as an individual) can be attributed the case minimum for the measure. We are also finalizing our proposal that if a benchmark is not developed, the measure is not scored or included in the performance category.

#### (b) Assigning Points Based on Achievement

For each set of benchmarks, we proposed to calculate the decile breaks based on measure performance during the performance period and assign points for a measure based on which benchmark decile range the MIPS-eligible clinician's performance on the measure is between. We proposed that for cost measures, lower costs represent better performance. In other words, MIPS-eligible clinicians in the top decile would have the lowest cost of care. We proposed to use a methodology generally consistent with the methodology proposed for the quality performance category. We refer readers to Tables 21 and 22 of the proposed rule (81 FR 28260 through 28261), for details on assigning points based on decile distribution. We requested comments on the methodology for assigning points based on performance period deciles for the cost performance category and solicited comments on alternative methodologies for assigning points for performance under this performance category for future rulemaking.

For clarity, we have reproduced Table 21 from the proposed rule in Table 25. Table 25

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

illustrates an example of using decile points along with partial points to assign achievement points for a sample cost measure.

**TABLE 25: Example of Using Benchmarks for One Sample Measure to Assign Points**

Decile	Average Cost	Possible Points
Benchmark Decile 1	\$100,000 or more	1.0-1.9
Benchmark Decile 2	\$75,893-\$99,999	2.0-2.9
Benchmark Decile 3	\$69,003-\$75,892	3.0-3.9
Benchmark Decile 4	\$56,009-\$69,002	4.0-4.9
Benchmark Decile 5	\$50,300-\$56,008	5.0-5.9
Benchmark Decile 6	\$34,544-\$50,299	6.0-6.9
Benchmark Decile 7	\$27,900-\$34,543	7.0-7.9
Benchmark Decile 8	\$21,656-\$27,899	8.0-8.9
Benchmark Decile 9	\$15,001-\$21,655	9.0-9.9
Benchmark Decile 10	\$1,000-\$15,000	10

Note: The numbers provided in this table are for illustrative purposes only.

The following is summary of the comments we received regarding our proposal to assign points for a measure based on performance period deciles for the cost performance category.

Comment: A commenter expressed concern with the use of the decile scoring system for the cost performance category, noting that the wide variation in spending demonstrated in Table 21 of the proposed rule indicated that the cost measures are not properly risk adjusted. Another commenter expressed concern that the decile approach was not reliable.

Response: We noted that Table 21 in the proposed rule was provided for illustrative purposes only and was not created on the basis of any particular data analysis. We believe that the decile approach is appropriate to measure relative performance for the cost performance category and is consistent with the approach taken for the quality performance category of MIPS.

Comment: Some commenters recommended that the cost performance category be scored on both achievement and improvement. Commenters indicated that MACRA requires improvement to be considered in calculating this performance category.

Response: Section 1848(q)(5)(D) of the Act requires us to consider both achievement

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

and improvement in assessing the cost performance category beginning with the second year of MIPS if data sufficient to measure improvement is available. We will discuss how to incorporate improvement in future rulemaking.

After considering the comments, we are finalizing our proposal to assign 1 to 10 achievement points for each measure based on which benchmark decile range the MIPS eligible clinician's performance on the measure is between.

#### (c) Case Minimum Requirements

We seek to ensure that MIPS eligible clinicians are measured reliably; therefore, we proposed in section II.E.5.e.(3)(81 FR 28198) of the proposed rule, to establish a 20 case minimum for each cost measure. We noted that this would include the MSPB measure. In the CY 2016 PFS final rule, we finalized a policy that increases the required case minimum for MSPB from 20 to 125 cases (80 FR 71295 through 71296). As discussed further in section II.E.5.e.(3)(a)(ii) of this final rule with comment period, after considering the comments and reviewing additional data sources, we finalized a higher case minimum of 35 for a MIPS eligible clinician or group to be attributed the MSPB cost measure. This newly established case minimum of 35 will ensure that the measure meets our reliability threshold for both groups and individual clinicians. We finalized a case minimum of 20 for all other cost measures and finalized at §414.1380(b)(2)(ii) that MIPS eligible clinicians and groups must meet the minimum case volume specified by CMS to be scored on a cost measure for the cost performance category for the clinician or group.

#### (d) Calculating the Cost Performance Category Score

To calculate the cost performance category score, we proposed at §414.1380(b)(2)(iii) to average all the scores of all the cost measures attributed to the MIPS eligible clinician. All measures in the cost performance category as described in section II.E.5.e. of the proposed rule

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

would be weighted equally. If a MIPS eligible clinician has only one cost measure with a required case minimum to be scored, we proposed to score that measure accordingly, and the MIPS eligible clinician's cost performance category score would consist of the score for that one measure. We noted that MIPS eligible clinicians cannot receive a zero score for any cost measure for failure to submit the measure since none of the cost performance category measures are submitted by MIPS eligible clinicians. Rather, these measures are attributed to MIPS eligible clinicians through claims data. However, if a MIPS eligible clinician is not attributed any cost measures (for example, because the case minimum requirements have not been met for any measure or there is not a sufficient number of MIPS eligible clinicians to create a benchmark for any measure), then a cost performance category score would not be calculated. Refer to section II.E.6.b.(2) of this final rule with comment period for details on how we address scenarios where a performance category score is not calculated for a MIPS eligible clinician. MIPS eligible clinicians would receive performance feedback as required under section 1848(q)(12) of the Act and discussed in section II.E.8.a. of this final rule with comment period. Over time, performance feedback may include a list of attributed cases for each measure by MIPS eligible clinician. We requested comment on our proposals to calculate the cost performance category score.

Table 22 of the proposed rule illustrated a sample scoring methodology for a limited set of measures (81 FR 28261). Measures that do not meet the required case minimum are not used for scoring. Unlike the quality performance category score, we did not propose bonus points as part of the cost performance category score. The following is summary of the comments we received regarding our proposed calculation of the cost performance category score:

Comment: One commenter opposed our proposal to weigh all cost measures equally, indicating that the total per capita cost measure should be weighed more heavily due to a lack of experience with other measures. Some commenters suggested that cost measures be weighted on

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the basis of the volume of attributed patients for each of the individual measures that are scored, rather than weighted equally regardless of patient volume.

Response: We are making two important changes to the cost performance category that are relevant to these comments. First, we are reducing the number of cost measures from the proposed rule to only include those which have previously been used in the VM or the 2014 sQRUR. Secondly, we are reducing the weight of the cost performance category to zero in the MIPS final score for the 2019 MIPS payment year to allow clinicians and groups to better understand the different attribution and scoring approach used in this category as compared with the approach to cost measures for the VM. Given that we are reducing the weight of the category to zero, we do not believe it is necessary for the 2019 MIPS payment year to create differential weighting for individual measures, whether it is by weighting measures based on an individual clinician or group patient volume, charges, or establishing a static weight that always weights a particular measure higher or lower for all clinicians or groups. We encourage clinicians to review performance feedback to become more familiar with the measures and the scoring for this category. We will continue to review the cost performance category and consider changes as we develop and include additional cost measures in the future.

Comment: Some commenters opposed our proposal to include all measures for which a clinician or group meets the case minimum in calculating a cost performance score and recommended that scoring be limited to a certain number of measures. Some commenters expressed concern that cost for a particular patient could be captured within multiple measures and encouraged CMS to only use the measures with the highest scores.

Response: Our goal in the cost performance category of MIPS is to include as broad a collection of measures as possible to measure costs for many different patients. Some clinicians or groups may have a larger number of cost measures attributed to them, particularly as we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

continue to develop new episode-based measures, but we believe that this larger number of attributed measures reflects a breadth of care provided by a clinician or group. Given that there is no additional reporting burden associated with cost measures, we do not believe it is appropriate to limit the number of measures that apply once the case minimums are met.

We also understand that there are cases in which an individual clinician or group might have the same individual patient costs attributed for multiple cost measures. However, we do not believe that this justifies limiting the number of measures in the cost performance category score for a particular clinician or group. In the quality performance category, if a clinician submits more measures than required, we will only include those with the highest score in the performance category score. We do this in part to encourage quality reporting on new and diverse measures. Because cost measures do not require reporting, we do not believe this rationale applies for the cost performance category. We will use all cost measures that meet the case minimums in calculating the cost performance category score, as long as those measures have also met our standards for the minimum number of attributed clinicians or groups needed to calculate a benchmark.

After consideration of the comments, we are finalizing our proposal at §414.1380(b)(2)(iii) that a MIPS eligible clinician's cost performance category score is the equally-weighted average of all scored costs measures. We are also finalizing our proposal to not calculate a cost performance category score if a clinician or group is not attributed any cost measures, because the clinician or group has not met the case minimum requirements for any of the cost measures or a benchmark has not been created for any of the cost measures that would otherwise be attributed to the clinician or group. As described in section II.E.5.e.(2) of this final rule with comment period, we are finalizing a 0 percent weight for the cost performance category for the transition year of MIPS, a 10 percent weight for MIPS payment year 2020. For MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

payment year 2021 and beyond, the cost performance category will be 30 percent. This reduced weighting provides an opportunity for MIPS eligible clinicians to become familiar with the scoring in the cost performance category of MIPS.

#### (4) Scoring the Improvement Activities Performance Category

Section 1848(q)(5)(C) of the Act outlines specific scoring rules for the improvement activities performance category. Section 1848(q)(5)(C)(i) of the Act provides that a MIPS eligible clinician who is in a practice that is a certified patient-centered medical home or comparable specialty practice for a performance period shall receive the highest potential score for the improvement activities performance category for such period. Section 1848(q)(5)(C)(ii) of the Act provides that MIPS eligible clinicians participating in an APM for a performance period shall earn a minimum score of one-half of the highest potential score for the improvement activities performance category for such period. We refer readers to section II.E.5.h. of this final rule with comment period for a description of the APM scoring standard for MIPS APMs. Section 1848(q)(5)(C)(iii) of the Act states that MIPS eligible clinicians are not required to perform activities in each subcategory or participate in an APM to receive the highest possible score for the improvement activities performance category. Based on these criteria, we proposed a scoring methodology that assigns points for the improvement activities performance category (based on certified patient-centered medical home participation and the improvement activities reported by the MIPS eligible clinician). A MIPS eligible clinician's performance would be evaluated by comparing the reported improvement activities to the highest possible score.

##### (a) Assigning Points to Reported Improvement Activities.

Improvement activities is a new performance category that has not been implemented in our previous programs. Therefore, in the transition year, we cannot assess how well the MIPS eligible clinician has performed on the activity against data from a baseline year. We can only assess whether the MIPS eligible clinician has participated sufficiently to receive credit in the improvement activities performance category. Therefore, we proposed at §414.1380(b)(3) to assign points for each reported activity within two categories: medium-weighted and high-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

weighted activities (81 FR 28261). Medium-weighted activities are worth 10 points. High-weighted activities are worth 20 points. Table 26 under section II.E.6.a(4)(a) of this final rule with comment period lists all of the improvement activities that are high-weighted. All other activities not listed as high-weighted activities are considered medium activities. Table H in the Appendix of this final rule with comment period provides the Improvement Activities Inventory of all activities, both medium-weighted and high-weighted. Consistent with our unified scoring system principles, MIPS eligible clinicians would know in advance how many potential points they could receive for each improvement activity.

Activities are proposed to be weighted as high based on the extent to which they align with activities that support the certified patient-centered medical home, since that is the standard under section 1848(q)(5)(C)(i) of the Act for achieving the highest potential score for the improvement activities performance category, as well as with our priorities for transforming clinical practice. Additionally, activities that require performance of multiple actions, such as participation in the Transforming Clinical Practice Initiative, participation in a MIPS eligible clinician's state Medicaid program, or an activity identified as a public health priority (such as emphasis on anticoagulation management or utilization of prescription drug monitoring programs) are justifiably weighted as high. We solicited comment on which activities should receive a high weight as opposed to a medium weight.

We also considered an approach of equal weighting for all improvement activities. We solicited comment on a multi-tier weighting approach such as low, medium and high activity categories for future years of MIPS.

The following is a summary of the comments we received regarding our proposal on the assigning of points to reported improvement activities.

Comment: A number of commenters requested a reduction in the number of activities or

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

a reduction in the reporting threshold from 60 to 30 points to meet 100 percent of scoring for this performance category, citing reporting burden and the limited amount of time that clinicians will have to prepare to begin reporting improvement activities for this new performance category. Some commenters requested a requirement of a maximum of three activities and other commenters suggested four activities.

Response: After consideration of the comments, we are modifying our proposal to reduce the number of activities so that no more than four medium-weighted activities, or no more than two high-weighted activities, or an equivalent combination (that is, 1 high and 2 medium) are required in order to achieve the highest possible improvement activities performance category score. The comments we received support this modification as commenters expressed concerns about the limited amount of time MIPS eligible clinicians will have to start preparing for these activities and also the burden associated with reporting additional activities.

After consideration of the comments, we are finalizing our proposals at §414.1380(b)(3) to assign points for improvement activities according to two weightings: medium-weighted; and high-weighted activities. Each medium-weighted activity is worth 10 points toward the total category score, and each high-weighted activity is worth 20 points toward the total category score of 40 points. These points are doubled for small practices, rural practices, or practices located in geographic health professional shortage areas (HPSAs), and non-patient facing MIPS eligible clinicians. We refer readers to section II.E.6.a.(4)(d) of this final rule with comment period for further detail on improvement activities scoring.

We are finalizing Table 23 of the proposed rule (81 FR 28263) with modifications that include clarifying language for one of the existing PDMP activities that is assigned the highest points for an activity (20 points), revising the description of one existing activity under the Emergency Response and Preparedness Subcategory that is also assigned the highest points for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. an activity (20 points) and changing the period for this activity to be performed from a minimum of 6 months to 60 days, which is better aligned with the new overall performance period for the Quality Payment Program of a 90-day reporting period, and we are changing the weighting of one existing activity in the Population Management subcategory from medium-weighted and instead assigning it the highest points for an activity (20 points). We are changing this existing activity from a medium to a high-weighted activity to incentivize caring for these vulnerable populations. These modifications are reflected in Table 26, which lists the improvement activities that are assigned the highest points for an activity (high-weighted activities are double-weighted to 40 points for MIPS eligible clinicians that are small practices, practices located in rural areas, geographic HPSAs, or non-patient facing MIPS eligible clinicians and 20 points for all other MIPS eligible clinicians). Table H in the Appendix to this final rule with comment period provides the Improvement Activities Inventory of all activities, both medium-weighted and high-weighted.

**TABLE 26: Finalized Improvement Activities Assigned the Highest Points**

Subcategory	Activity
Expanded Practice Access	<p>Provide 24/7 access to MIPS eligible clinicians, eligible groups, or care teams for advice about urgent and emergent care (e.g., eligible clinician and care team access to medical record, cross-coverage with access to medical record, or protocol-driven nurse line with access to medical record) that could include one or more of the following:</p> <ul style="list-style-type: none"> <li>Expanded hours in evenings and weekends with access to the patient medical record (for example, coordinate with small practices to provide alternate hour office visits and urgent care);</li> <li>Use of alternatives to increase access to care team by MIPS eligible clinicians and groups, such as e-visits, phone visits, group visits, home visits and alternate locations (for example, senior centers and assisted living centers); and/or</li> <li>Provision of same-day or next-day access to a consistent MIPS eligible clinician, group or care team when needed for urgent care or transition management.</li> </ul>
Population Management	<p>Participation in a systematic anticoagulation program (coagulation clinic, patient self-reporting program, patient self-management program) for 60 percent of practice patients in the transition year and 75 percent of practice patients in year 2 who receive anti-coagulation medications (warfarin or other coagulation cascade inhibitors).</p>
Population Management	<p>MIPS eligible clinicians and MIPS eligible clinician and groups who prescribe oral Vitamin K antagonist therapy (warfarin) must attest that, in the first performance period, 60 percent or more of their ambulatory care patients receiving warfarin are being managed by one or more of these improvement activities:</p> <ul style="list-style-type: none"> <li>Patients are being managed by an anticoagulant management service, that involves systematic and coordinated care, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions;</li> <li>Patients are being managed according to validated electronic decision support and clinical management tools that involve systematic and coordinated care, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions;</li> <li>For rural or remote patient, patients are managed using remote monitoring or telehealth options that involve systematic and coordinated care, incorporating comprehensive patient education, systematic INR testing, tracking, follow-up, and patient communication of results and dosing decisions; and/or</li> <li>For patients who demonstrate motivation, competency, and adherence, patients are managed using either a patient self-testing (PST) or patient-self-management (PSM) program.</li> </ul> <p>The performance threshold will increase to 75 percent for the second performance period and onward.</p> <p>Clinicians would attest that, 60 percent for the transition year, or 75 percent in future years, of their ambulatory care patients receiving warfarin participated in an anticoagulation management program for at least 90 days during the performance period.</p>

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Subcategory	Activity
Population Management	<p>For outpatient Medicare beneficiaries with diabetes and who are prescribed antidiabetic agents (for example, insulin, sulfonylureas), MIPS eligible clinicians and MIPS eligible clinician groups must attest to having:</p> <p>For the first performance period, at least 60 percent of medical records with documentation of an individualized glycemic treatment goal that:</p> <ul style="list-style-type: none"> <li>a) Takes into account patient-specific factors, including, at least age, comorbidities, and risk for hypoglycemia; and</li> <li>b) Is reassessed at least annually.</li> </ul> <p>The performance threshold will increase to 75 percent for the second performance period and onward.</p> <p>Clinicians would attest that, 60 percent for the transition year, or 75 percent in future years, of their medical records that document individualized glycemic treatment represent patients who are being treated for at least 90 days during the performance period.</p>
Population Management	<p>Participating in a Rural Health Clinic (RHC), Indian Health Service (IHS), or Federally Qualified Health Center in ongoing engagement activities that contribute to more formal quality reporting, and that include receiving quality data back for broader quality improvement and benchmarking improvement which will ultimately benefit patients. Participation in Indian Health Service, as an improvement activity, requires MIPS eligible clinicians and groups to deliver care to federally recognized American Indian and Alaska Native populations in the U.S. and in the course of that care implement continuous clinical practice improvement including reporting data on quality of services being provided and receiving feedback to make improvements over time.</p>
Population Management	<p>Use of a Qualified Clinical Data Registry to generate regular performance feedback that summarizes local practice patterns and treatment outcomes, including for vulnerable populations.</p>
Care Coordination	<p>Participation in the CMS Transforming Clinical Practice Initiative.</p>
Beneficiary Engagement	<p>Collection and follow-up on patient experience and satisfaction data on beneficiary engagement, including development of improvement plan.</p>
Patient Safety and Practice Assessment	<p>Clinicians would attest that, 60 percent for the transition year, or 75 percent in the second year, of consultation of prescription drug monitoring program prior to the issuance of a Controlled Substance Schedule II (CSII) opioid prescription that lasts for longer than 3 days.</p>
<u>Patient Safety and Practice Assessment</u>	<p><u>Participation in the Consumer Assessment of Healthcare Providers and Systems Survey or other supplemental questionnaire items (e.g., Cultural Competence or Health Information Technology supplemental item sets).</u></p>
Achieving Health Equity	<p>Seeing new and follow-up Medicaid patients in a timely manner, including individuals dually eligible for Medicaid and Medicare.</p>
Emergency Response and Preparedness	<p>Participation in domestic or international humanitarian volunteer work. Activities that simply involve registration are not sufficient. MIPS eligible clinicians and groups attest to domestic or international humanitarian volunteer work for a period of a continuous 60 days or greater.</p>
Integrated Behavioral and Mental Health	<p><u>Integration facilitation, and promotion of the colocation of mental health and substance use disorder services in primary and/or non-primary clinical care settings.</u></p>

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Subcategory	Activity
Integrated Behavioral and Mental Health	<p>Offer integrated behavioral health services to support patients with behavioral health needs, dementia, and poorly controlled chronic conditions that could include one or more of the following:</p> <ul style="list-style-type: none"> <li>Use evidence-based treatment protocols and treatment to goal where appropriate;</li> <li>Use evidence-based screening and case finding strategies to identify individuals at risk and in need of services;</li> <li>Ensure regular communication and coordinated workflows between eligible clinicians in primary care and behavioral health;</li> <li>Conduct regular case reviews for at-risk or unstable patients and those who are not responding to treatment;</li> <li>Use of a registry or other certified health information technology functionality to support active care management and outreach to patients in treatment; and/or</li> <li>Integrate behavioral health and medical care plans and facilitate integration through co-location of services when feasible.</li> </ul>

(b) Improvement Activities Performance Category Highest Potential Score

Although there is likely to be variability in the level at which each MIPS eligible clinician may perform improvement activities, we currently do not have a standard way of measuring that variability. In future years, we plan to capture data to begin to develop a baseline for measuring improvement in performing improvement activities. Because we cannot measure variable performance within an improvement activity at this time, we proposed at §414.1380(b)(3)(v) to compare the points associated with the reported activities against the highest potential score (81 FR 28265). We proposed the highest potential score to be 60 points for the transition year performance period based on the following rationale.

Based on discussions with several high performing organizations, we believed that MIPS eligible clinicians would be able to report on as many as six activities of medium weight. Examples of these organizations include one that led a major redesign of patient workflow after Hurricane Katrina, implementing clinical practice improvements to ensure patients receive faster

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

treatment in the event of future disasters, ranked nationally in six adult specialties and high-performing in six adult specialties;<sup>33</sup> a second that was recognized by a leading medical association that achieved: 6.7 percent 30-day all cause readmissions, 42 percent fewer ED visits with implementation of a 60-day intensive home care program, costs of 15-28 percent below regional average and significant improvement in patient surveys from CAHPS<sup>34</sup>; and a third recognized as a leader in rural health with the highest award for excellence from the National Rural Primary Care Association.

We also believed that a top performing small practice or practice in a rural area or geographic HPSA, or a non-patient facing MIPS eligible clinician would be able to report on at least two activities. In consideration of special circumstances for these small practices, as well as practices located in rural areas and in HPSAs or non-patient facing MIPS eligible clinicians, we proposed that the weight for any activity selected would be 30 points. For any MIPS eligible clinician, the maximum total points achievable in this performance category is 60 points. Based on the above rationale, we believed it was reasonable to expect all MIPS eligible clinicians to be able to report improvement activities, and as such, a MIPS eligible clinician reporting no improvement activities would receive a zero score for the improvement activities performance category. We believed this proposal would allow us to capture variation in reporting the improvement activities performance category.

Section 414.1355(a) of the proposed rule presented the CMS Study on Improvement Activities and Measurement (81 FR 28214). Given the burden for participants completing the year-long study and the value of collectively examining innovation and practice activities to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

improve clinical quality data submissions and further reduce time requirements for eligible clinicians and groups to report, we proposed that MIPS eligible clinicians and groups that successfully participate and submit data to fulfill study requirements would receive the highest potential score of 60 points for the improvement activities performance category.

The following is a summary of the comments we received regarding our proposal on the methodology for achieving the highest score.

Comment: Commenters supported considerations for small, rural, HPSA and non-patient facing MIPS eligible clinicians, but recommended that CMS allow these entities to report on two medium-weighted improvement activities or one high-weighted improvement activity in order to achieve 100 percent of the total possible score, and to report on one medium-weighted improvement activity to achieve 50 percent of the total possible score.

Response: As discussed in section I.E.5.f.(2) of this final rule with comment period, we are reducing the number of activities for these types of clinicians. Rather than selecting any two activities, these practices may select either two medium-weighted activities, or one high-weighted activity, to achieve the highest score.

Comment: Other commenters recommended that CMS use a uniform weighting for all the activities, and that scoring for this category be aligned with the other performance categories.

Response: We justify the weighting of high for specific activities based on our priorities for specific programs/activities and alignment with activities that would be performed by a clinician in a certified patient-centered medical home or comparable specialty practice. For weighting of a high, we focused on areas with activities that promote CMS public health priorities and support the patient centered medical home. We are retaining the two weights, medium and high for activities.

Comment: Commenters also requested general clarification about how credit for meeting

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

improvement activities participation requirements will be determined, and questioned how groups will be scored.

Response: Scoring is based on the number of different weighted activities selected from the broad list in Table H in the Appendix to this final rule with comment period. As discussed in section II.E.6.a.(4)(a) of this final rule with comment period, small practices, practices located in rural areas or geographic health professional shortage areas or non-patient facing MIPS eligible clinicians receive 20 points by selecting one medium-weighted activity and receive 40 points by selecting two medium-weighted activities, or alternatively may select one high-weighted activity to receive 40 points. If a MIPS eligible clinician, other than a MIPS APM or APM, does not select any activity, they will receive zero points in the improvement activities performance category.

All other MIPS eligible clinicians, other than a MIPS APM, will receive 10 points by selecting one medium-weighted activity (a medium-weighted activity is double-weighted for small practices, practices located in rural areas and geographic HPSAs, and non-patient facing MIPS eligible clinicians); 20 points by selecting two medium-weighted activities; 30 points by selecting three medium activities; and 40 points by selecting four medium-weighted activities. An APM, other than a MIPS APM, only needs to select two medium or one high-weighted activity to add to their automatic score of at least one-half of the highest score. Alternatively, these same MIPS eligible clinicians may receive 20 points by selecting one high-weighted activity (a high-weighted activity is double-weighted for small practices, practices located in rural areas and geographic HPSAs, and non-patient facing MIPS eligible clinicians), or 40 points by selecting two high-weighted activities. With the exception of small practices, practices in rural areas and geographic HPSAs and non-patient facing MIPS eligible clinicians, a combination of one medium-weighted activity and one high-weighted activity would achieve 30

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

points and two medium- and one high-weighted activity would achieve 40 points. MIPS eligible clinicians or groups, other than APMs, who do not select any activity would receive zero points.

Comment: Commenters recommended that practices participating in APMs should receive more than 50 percent of the total possible score and recommended that participants receive up to 100 percent of the total possible score. One commenter recommended that alternatively, activity reporting be allowed at the APM entity level to reduce reporting burden.

Response: We are finalizing our proposal that APM participants will receive at least one-half of the highest possible score. However, we recognize that participating in an APM requires significant effort from practices and eligible clinicians, and with that in mind, we are revising the improvement activities performance category scoring policy for MIPS APMs. To develop the improvement activities score assigned to all MIPS APMs, CMS will compare the requirements of the specific APM with the list of activities in the Improvement Activities Inventory in Table H in the Appendix to this final rule with comment period and score those activities in the same manner that they are otherwise scored for MIPS eligible clinicians according to section II.E.6.a.(4) of this final rule with comment period. For further explanation of how MIPS APMs scores will be calculated, we refer readers to section II.E.5.h of this final rule with comment period.

After consideration of the comments, we are not finalizing our proposal at §414.1380(b)(3)(v) to compare the points associated with the reported activities against the highest potential score of 60 points but are using 40 points instead as the total points possible to achieve the highest score for the transition year performance period (81 FR 28265). For small practices, rural and geographic HPSA practices and non-patient facing MIPS eligible clinicians, the weight for any activity selected would be doubled so that these practices only need to select one high- or two medium-weighted activities to achieve the highest score of 40 points. We are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

finalizing our proposal that MIPS eligible clinicians participating in APMs will automatically receive one-half of the highest score for improvement activities and in addition, MIPS APMs may receive a higher score based on the improvement activities performance category score that CMS assigns for each MIPS APM based on the extent to which the requirements of the specific model meet the list of activities in the Improvement Activities Inventory. We note that one-half of the highest score for improvement activities is the minimum amount that eligible clinicians participating in APMs could achieve, in accordance with the statute. We refer readers to section II.E.5.h of this final rule with comment period for additional information about how a MIPS APM can achieve the highest score.

The following is a summary of the comments we received regarding our proposal to conduct the CMS Study on Improvement Activities and Measurement.

Comment: One commenter agreed that improvement activities performance category study participants should receive full credit for improvement activities performance category and that those participants that do not meet study guidelines should be removed and be subject to typical improvement activities performance category requirements. This commenter recommended that CMS provide a final date by which it plans to make these exclusion determinations and that after this date, CMS can work with the ex-participant to help them complete the year. They also recommended that all participants who get excluded from the study not be allowed to participate in the study the following year.

Response: We will continue to work with stakeholders to further define future participation requirements as this study evolves.

After consideration of the comments, we are finalizing our proposal that MIPS eligible clinicians and groups that successfully participate and submit data to fulfill study requirements will receive the highest score for the improvement activities performance category.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(c) Points for Certified Patient-Centered Medical Home or Comparable Specialty Practice

Section 1848(q)(5)(C)(i) of the Act specifies that a MIPS eligible clinician who is in a practice that is certified as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, for a performance period must be given the highest potential score for the improvement activities performance category for the performance period. We proposed that certified patient-centered medical home practices are those that have received accreditation from any of the following four nationally recognized accreditation organizations the Accreditation Association for Ambulatory Health Care, the National Committee for Quality Assurance (NCQA), The Joint Commission, and the Utilization Review Accreditation Commission (URAC);<sup>35</sup> or are a Medicaid Medical Home Model or Medical Home Model. We proposed that our proposed comparable specialty practices are those that include the NCQA Patient-Centered Specialty Recognition. We refer readers to II.E.5.g.(5) of this final rule with comment period for a description of the Medical Home Model and the Medicaid Medical Home Model. The four accreditation organizations listed above all have evidence of being used by a large number of medical organizations as the model for their patient-centered medical home and are national in scope. No other criteria are required for receiving recognition as a certified patient-centered medical home or comparable specialty practice except for being recognized by one of the above organizations.

We outlined at §414.1355(b) of the proposed rule the policy for certified patient-centered medical homes (81 FR 28209). The organizations identified above maintain a list of certified patient-centered medical homes, including the Medical Home Models and the Medicaid Medical Home Models, that would be used to determine whether a MIPS eligible clinician qualifies for

---

<sup>18</sup> The name was officially shortened to URAC in 1996.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the highest potential score for the improvement activities performance category because the MIPS eligible clinician is in a certified patient-centered medical home. The NCQA maintains a list of practices that have received the Patient-Centered Specialty Recognition which would be used to determine whether a MIPS eligible clinician qualifies for the highest potential score for the improvement activities performance category because the MIPS eligible clinician is in a comparable specialty practice.

We proposed at §414.1380(b)(3) that a MIPS eligible clinician who is in a practice that is certified as a patient-centered medical home, including a Medical Home Model, Medicaid Medical Home Model or comparable specialty practice in accordance with those proposals would receive the highest potential score (in accordance with section 1848(q)(5)(C)(i) of the Act) of 60 points for the improvement activities performance category (81 FR 28210).

The following is summary of the comments we received regarding our proposal to provide practices defined as certified patient-centered medical homes with the highest score for the improvement activities performance category. We address comments regarding the specifics of this definition in section II.E.5.f.(3)(b) of this final rule with comment period.

Comment: One commenter strongly recommended a flexible approach to quality assessment that emphasizes outcomes of care and that favors continuous quality improvement methodologies rather than rigid, process-oriented patient-centered medical home certification models, believing that relying on patient-centered medical home certification as a means of quality assessment runs the risk of practices not actually realigning efforts to produce higher quality and more cost effective care.

Response: Our policy on this topic is required by the statute, which specifically identifies MIPS eligible clinicians who practice in a certified patient-centered medical home or comparable specialty practices as receiving the highest score for the improvement activities performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

category; this policy does not apply to the quality category.

Comment: Several commenters supported certified patient-centered medical homes and supported MIPS eligible clinicians who practice in these entities receiving full credit for the improvement activities category. One commenter suggested that patient-centered medical homes stratify data by disparity variables and implement targeted interventions to address health disparities. These commenters believed that the presentation of the information in this way will allow MIPS eligible clinicians to better understand the patient-centered medical home model and decide how to best deliver care under MIPS. Additional commenters suggested including activities under the improvement activities category that are associated with actions conducted by a certified patient-centered medical home. The commenters recommended the following subcategories of activities be associated with elements of a patient-centered medical home: expanded practice access, population management, care coordination, beneficiary engagement, and patient safety and practice assessment.

Response: We do not believe the commenter is suggesting these elements should be a requirement for being approved to receive full credit as a certified patient-centered medical home. Stratification of data to address health disparities is something we will consider encouraging in the future. Reorganizing and expanding the existing Improvement Activities Inventory is something we look forward to working with stakeholders on in future years.

After consideration of these comments we are finalizing our proposal at §414.1380(b)(3) that a MIPS eligible clinician who is in a practice that is certified as a patient-centered medical home, including a Medicaid Medical Home, Medical Home Model, or comparable specialty practice, will receive the highest potential score (in accordance with section 1848(q)(5)(C)(i) of the Act) for the improvement activities performance category (81 FR 28210). However, as noted in section II.E.5.f.(3)(b) of this final rule with comment period, we are not finalizing our

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

proposal at §414.1380(b)(3)(v) to compare the points associated with the reported activities against the highest potential score of 60 points (81 FR 28210), but instead are using 40 points as the total points required to achieve the highest score for the transition year performance period.

We also are not finalizing our proposal at §414.1355(b) to only define certified patient-centered medical home practices as those that have received accreditation from four nationally recognized accreditation organizations (the Accreditation Association for Ambulatory Health Care, the National Committee for Quality Assurance (NCQA), The Joint Commission, and the Utilization Review Accreditation Commission (URAC)); or comparable specialty practices as those that are a Medicaid Medical Home Model or Medical Home Model or from the NCQA Patient-Centered Specialty Recognition (81 FR 26210), rather we are finalizing an expanded definition of these practices at section II.E.5.f.(3)(b) of this final rule with comment period, and we refer readers to the specifics of this definition in section II.E.5.f.(3)(b) of this final rule with comment period.

#### (d) Calculating the Improvement Activities Performance Category Score

To determine the improvement activities performance category score, we proposed to sum the points for all of the MIPS eligible clinician's reported activities and divide by the proposed improvement activities performance category highest potential score of 60. A perfect score would be 60 points divided by 60 possible points, which equals 100 percent. If MIPS eligible clinicians have more than 60 improvement activities points, then we proposed to cap the resulting improvement activities performance category score at 100 percent.

Table 24 of the proposed rule illustrated a sample scoring methodology for the improvement activities performance category for a MIPS eligible clinician that is not an APM participant (81 FR 28267). For example, the MIPS eligible clinician was not an APM participant and did not immediately earn the minimum score of one-half of the highest potential score or 30 points that are available for APM participation. The MIPS eligible clinician completed two

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

high-weighted activities worth 20 points each and two medium-weighted activities for 10 points each to receive the maximum 60 points available in the improvement activities performance category score of 100 percent.

Alternatively, the MIPS eligible clinician could have selected three high-weighted activities for 20 points each, six medium-weighted activities for ten points each, or some combination to reach 60 points. The score however is capped at 100 percent (60/60). This means that a MIPS eligible clinician who selects four high-weight activities (80 possible points) would still be given a score of 100 percent (60/60). Please refer to Table 24 of the proposed rule for the illustration of the proposed methodology (81 FR 28267).

Section 1848(q)(2)(B)(iii) of the Act requires the Secretary to give consideration to the circumstances of small practices and practices located in rural areas and in geographic HPSAs (as designated under section 332(a)(1)(A) of the Public Health Service Act) in defining activities. Section 1848(q)(2)(C)(iv) of the Act also requires the Secretary to give consideration to non-patient facing MIPS eligible clinicians. Further, section 1848(q)(F)(5) of the Act allows the Secretary to assign different scoring weights for measures, activities, and performance categories, if there are not sufficient measures and activities applicable and available to each type of eligible clinician.

For MIPS eligible clinicians and groups that are small practices, practices located in rural areas, practices located in geographic HPSAs, or non-patient facing MIPS eligible clinicians or non-patient facing MIPS eligible clinician groups, we proposed alternative scoring requirements for the improvement activities performance category. The rationale for this alternative scoring is grounded in the resource constraints these MIPS eligible clinicians face which was further discovered during listening sessions with small, rural and geographic HPSAs and medical societies for non-patient facing MIPS eligible clinicians and groups. We believe that while non-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

patient facing MIPS eligible clinicians and non-patient facing groups could select activities from some sub-categories (such as care coordination and patient safety), for other sub-categories (such as beneficiary engagement and population management) non-patient facing MIPS eligible clinicians and groups will need to consider novel practice activities that are within their scope and can improve beneficiary care. We will continue to work with non-patient facing MIPS eligible clinician professional organizations to further develop activities relevant for these clinicians in future years. Our rationale for small practices and practices located in rural areas and in HPSAs is grounded in the resource constraints that these MIPS eligible clinicians face. This rationale is especially compelling given that each activity requires at least 90 days and may not necessarily be conducted in parallel, with time allocated to pre-planning and post-planning, which would impact the practice's limited resources.

All MIPS eligible clinicians would be allowed to self-identify as a certified patient-centered medical home or comparable specialty practice, a non-patient facing MIPS eligible clinician, a small practice, a practice located in a rural area, or a practice in a geographic HPSA or any combination thereof as applicable during attestation following the performance period. We refer readers to <https://innovation.cms.gov/Medicare-Demonstrations/Medicare-Medical-Home-Demonstration.html> for more information on the Medical Home Model.

We would validate these self-identifications as appropriate. We proposed that the following scoring would apply to MIPS eligible clinicians who are a non-patient facing MIPS eligible clinician, a small practice (consisting of 15 or fewer professionals), a practice located in a rural area, or practice in a geographic HPSA or any combination thereof:

- Reporting of one medium-weighted or high-weighted activity would result in 50 percent of the highest potential score.
- Reporting of two medium-weighted or high-weighted activities would result in 100

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

percent of the highest potential score.

In future years, we may adjust the weighting of activities at the MIPS eligible clinician level based on initial patterns of improvement activities reporting. For example, if a MIPS eligible clinician reports on the same medium-weighted activity over several performance periods, in a subsequent year that MIPS eligible clinician may not be allowed to continue to select that same activity. This is because section 1848(q)(2)(C)(v)(III) of the Act provides that the intent of the improvement activities performance category is to demonstrate improvement over time and not just demonstrate same benefit from year to year. Specifically, the statute defines that an activity is expected, when effectively executed, to result in improved outcomes, which would be demonstrated over time. If a MIPS eligible clinician reports on the same activity from year to year that does not show improved outcomes, it would not be in line with the spirit of statute.

For example, continuing to provide expanded practice access year after year would not demonstrate improved outcomes over time. Further, should the weighting of activities change in future years, we may also adjust the improvement activities performance category point target accordingly. We requested comment on our proposed approach to score the improvement activities performance category, and solicited comment on alternative methodologies for the improvement activities performance category. We sought to assure equity in scoring MIPS eligible clinicians while still considering activity variation, impact and burden.

The following is summary of the comments we received regarding our proposal to calculate the improvement activities performance score.

Comment: Commenters requested that CMS reduce the complexity in scoring, especially since improvement activities is a new performance category. One commenter disagreed with the complexity of the MIPS final score methodology, including for the improvement activities

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category, because it is difficult for physicians to understand, and to plan for the future.

Response: To address confusion regarding our proposal for calculating the improvement activities performance category score, we first explain in section II.E.5.f.(3) of this final rule with comment period, the number of activities that a MIPS eligible clinician or group must select to achieve the highest score. Under this same section, section II.E.5.f.(3), we also explain the number of activities that a small practice, a practice located in a rural area or geographic health professional shortage area, and non-patient facing MIPS eligible clinicians must select in order to achieve the highest score. Under section II.E.6.a.(4)(a) of this final rule with comment period, we explain the number of points that a medium-weighted activity and a high-weighted activity are worth for a MIPS eligible clinician or group, and we also explain the number of points that a medium-weighted activity and a high-weighted activity are worth for a small practice, a practice located in a rural area or geographic health professional shortage area, and non-patient facing MIPS eligible clinicians. In section II.E.6.a.(4)(d) of this final rule with comment period, we explain that the total number of points achievable for the improvement activities performance category are now 40 points since the maximum number of improvement activities a MIPS eligible clinician or group would have to report to achieve the highest score for improvement activities is four. This means that 40 points is the denominator for the improvement activities performance category. If a medium-weighted activity is worth 10 points and a MIPS eligible clinician reported four activities that would result in a total of 40 points (4 activities x 10 points each). A medium-weighted activity and a high-weighted activity are doubled for a small practice, a practice located in a rural area or geographic health professional shortage area, and non-patient facing MIPS eligible clinicians. We arrive at 40 points for a practice located in a rural area or geographic health professional shortage area, and non-patient facing MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians because the most these practices need to select are two medium-weighted activities that are double weighted (20 points x 2) which is equal to 40 points or one high-weighted activity that is double weighted (40 points x 1) which is equal to 40 points.

Comment: Some commenters requested that CMS specify how many MIPS eligible clinicians in each group must participate in each project in order to provide the points for the entire group. Other commenters were confused as to whether everyone in the group or TIN had to be a certified patient-centered medical home to receive the highest score.

Response: For the transition year of the MIPS program, there are no minimum participation thresholds established at the group level. There are also no thresholds for the number of practice sites within the same TIN that must be certified as a patient-centered medical home to receive the highest score. We anticipate that as we gain experience with the improvement activities category this may be modified in future years.

Comment: One commenter requested that bonus points be applied to the calculated score for prior year awards.

Response: We will not award bonus points for the improvement activities performance category in the transition year but will continue to monitor trends in the program to determine the need for a bonus in the future. We also clarify that we cannot give bonus points for an activity or award given outside of the program performance.

Comment: Several commenters supported the proposal that non-patient facing MIPS eligible clinicians select two activities, recognizing that the MIPS statute requires consideration of special circumstances for these types of clinicians. One commenter did not support the proposed policy allowing “non-patient facing” providers to perform a single activity in the improvement activities category to achieve one-half of the total points toward the improvement activities score and recommended that we hold all clinicians to the same standard.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We believe there are several subcategories such as beneficiary engagement and expanded practice access that may limit a non-patient facing MIPS eligible clinician from having access to the broader list of activities more than other types of practices and believe it is reasonable to limit the number of activities for non-patient facing MIPS eligible clinicians.

Comment: Commenters generally expressed their support for the approach of reducing improvement activities category requirements for non-patient facing MIPS eligible clinicians and groups, as well as clinicians practicing in rural areas or health professional shortage areas. One commenter disagreed with our proposed approach, however, noting that non-patient facing MIPS clinicians should be able to obtain the highest potential score for the improvement activities performance category without special modifications to improvement activities scoring. Another commenter suggested increasing the number of clinicians for small practices to 25 for purposes of the improvement activities category.

Response: We agree with commenters that supported reducing the improvement activities category requirements for non-patient facing MIPS eligible clinicians to two medium-weighted activities, or one high-weighted activity, and this policy is consistent with the statute, which states that the Secretary shall give consideration to the circumstances of professional types who typically furnish services that do not involve face-to-face interaction with the patient. We are finalizing our proposal to allow for either two medium or one high-weighted activity for these types of practices.

Comment: Commenters requested clarification regarding the need to self-identify during attestation following the performance period as a MIPS eligible clinician or group participating in an APM, certified patient-centered medical home or comparable specialty practice.

Response: We clarify that for MIPS eligible clinicians or groups participating in an APM, self-identification by attestation following the performance period is not necessary. For eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians or groups participating in a certified patient-centered medical home or comparable specialty practice, however, self-identification will be required.

After consideration of the comments, we are not finalizing our proposal to require achievement of 60 points to receive the highest score for the improvement activities performance category. Rather, we are only requiring a total of 40 points to receive the highest score for the improvement activities performance category. In alignment with the reduction in total points required, we are finalizing that the following scoring that will apply to MIPS eligible clinicians who are a non-patient facing clinician, a small practice, a practice located in a rural area, or practice in a geographic HPSA or any combination thereof:

- Reporting of one medium-weighted activity would result in 20 points or one-half of the highest score.
- Reporting of two medium-weighted activities would result in 40 points or the highest score.
- Reporting of one high-weighted activity would result in 40 points or the highest score.

In alignment with the reduction in total points required, we are finalizing the following scoring that will apply to MIPS eligible clinicians who are not a non-patient facing clinician, a small practice, a practice located in a rural area, or a practice in a geographic HPSA:

- Reporting of one medium-weighted activity would result in 10 points which is one-fourth of the highest score.
- Reporting of two medium-weighted activities would result in 20 points which is one-half of the highest score.
- Reporting of three medium-weighted activities would result in 30 points which is three-fourths of the highest score.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Reporting of four medium-weighted activities would result in 40 points which is the highest score.
- Reporting of one high-weighted activity would result in 20 points which is one-half of the highest score.
- Reporting of two high-weighted activities would result in 40 points which is the highest score.
- Reporting of a combination of medium-weighted and high-weighted activities where the total number of points achieved are calculated based on the number of activities selected and the weighting assigned to that activity (number of medium-weighted activities selected x 10 points + number of high-weighted activities selected x 20 points).

The most any MIPS eligible clinician or group can achieve for the improvement activities performance category is 40 points, so if more activities are selected than, for example, 4 medium-weighted activities, the total points that could be achieved is still 40 points. We refer readers to section II.E.5.g. of this final rule with comment period, regarding activities in the improvement activities performance category that would also qualify for a bonus under the advancing care information performance category. This bonus would be calculated under the Advancing Care Information Performance Category and not under the improvement activities Performance Category.

We also are not finalizing Table 24 of the proposed rule which provided an example of the scoring methodology based on a highest potential score of 60 points for the improvement activities performance category (81 FR 28267). We are instead finalizing Tables 27 and 28 that illustrate the sample scoring methodology for the improvement activities performance category based on a policy of a highest potential score of 40 points, which we are finalizing in this final

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

rule with comment period. The first example in Table 27 illustrates a sample scoring methodology for the improvement activities category for a MIPS eligible clinician that is not an APM participant or certified patient-centered medical home or comparable specialty practice or Medical Home Model and does not qualify as a small practice or a practice located in a rural or HPSA and is not a non-patient facing MIPS eligible clinician.

**TABLE 27: Improvement Activities Performance Category Scoring Example 1**

Activity	Subcategory	Total Possible Points	Relative Weight (based on whether a small, rural, geographic HPSA or non-patient facing MIPS eligible clinician)	Total Score
<b>For Midsize Practice (not rural, HPSA or non-patient facing)</b>				
Activity 1 (Medium Weighted)	Population Management	10	1	
Activity 2 (High Weighted)	Expanded Practice Access	20	1	
Total		30		30/40 points

The next example in Table 28 illustrates two examples of the scoring methodology for MIPS eligible clinicians that are small, rural or geographic HPSA practices or are a non-patient facing MIPS eligible clinician.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

**TABLE 28: Improvement Activities Performance Category Scoring Example 2**

Activity		Subcategory	Total Possible Points	Relative Weight (based on whether a small, rural, geographic HPSA or non-patient facing MIPS eligible clinician)	Total Score
<b>For Small, Rural, HPSA Practice or Non-Patient Facing Clinician</b>					
Clinician #1	Activity 1 (Medium Weighted)	Population Management	10	2	20 points
	Activity 2 (Medium Weighted)	Integrated Behavioral and Mental Health	10	2	20 points
	Total				40/40 points
Clinician #2	Activity 1 (High Weighted)	Patient Safety and Practice Assessment	20	2	40 points
	Total				40/40 points

We also finalize our proposal to calculate a score of zero points for any MIPS eligible clinician, except for an APM, if they do not report at least one activity. We further finalize that MIPS eligible clinicians or groups participating in APMs are not required to self-identify as part of an APM, but all MIPS eligible clinicians will be required to self-identify as part of a certified patient-centered medical home or comparable specialty practice, a non-patient facing MIPS eligible clinician, a small practice, a practice located in a rural area, or a practice in a geographic HPSA or any combination thereof to self-identify as applicable during attestation following the performance period. We will validate these self-identifications as appropriate.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

#### (5) Scoring the Advancing Care Information Performance Category

We refer readers to section II.E.5.g.(6) of this final rule with comment period, for our final methodology for scoring the advancing care information performance category.

#### b. Calculating the Final Score

Section II.E.6.a. of the proposed rule describes our proposed methodology for assessing and scoring MIPS eligible clinician performance for each of the four performance categories (81 FR 28248-28268). In this section, we proposed the methodology to determine the composite performance score (now called final score) based on the scores for each of the four performance categories. We proposed to define at §414.1305 the final score as a composite assessment (using a scoring scale of 0 to 100) for each MIPS eligible clinician for a specific performance period determined using the methodology for assessing the total performance of each MIPS eligible clinician according to the performance standards for the applicable measures and activities for each applicable performance category. The final score is the sum of the products of each performance category score and each performance category's assigned weight multiplied by 100.

#### (1) Formula to Calculate the Final Score

Section 1848(q)(5)(A) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to the performance standards for the applicable measures and activities for each performance category applicable to such clinician for a performance period, and using the methodology, provide for a final score (using a scoring scale of 0 to 100) for each MIPS eligible clinician for the performance period. Additionally, sections 1848(q)(5)(E) and (F) of the Act address the weights for each of the performance categories in the final score.

To create a final score from 0-100 based on the individual performance category scores, we proposed to multiply the score for each performance category by the assigned weight for the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category. We provided in Table 25 of the proposed rule (81 FR 28269), the weights for each performance category for the 2019, 2020 and 2021 MIPS payment years. The resulting weighted performance category scores would be summed to create a single final score. As described in section II.E.2. of the proposed rule (81 FR 28176-28177), we proposed that the identifier for MIPS performance would be the same for all four performance categories, and therefore, the methodology to calculate a final score would be the same for both individual and group performance.

The following equation summarizes the proposed final score calculation at §414.1380(c):

$$\text{final score} = [(\text{quality performance category score} \times \text{quality performance category weight}) + (\text{cost performance category score} \times \text{cost performance category weight}) + (\text{improvement activities performance category score} \times \text{improvement activities performance category weight}) + (\text{advancing care information performance category score} \times \text{advancing care information performance category weight})] \times 100.$$

We did not receive comments on our proposal to define at §414.1305 the final score as a composite assessment (using a scoring scale of 0 to 100) for each MIPS eligible clinician for a specific performance period.

We did receive several comments on our proposal to define at §414.1380(c) the MIPS final score calculation.

Comment: A few commenters stated the proposed scoring standards are confusing and complex and suggested that CMS revise the standards to produce a scoring formula that is streamlined and easier to understand. Several commenters simply believe the final score scoring approach is “too complex”. Several commenters noted that the scoring formula for the MIPS final score should be streamlined and scoring across the performance categories should be more integrated. Commenters raised concern that due to the complexity of the formulas, there would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

be an increased risk that scoring would lack accuracy and not reflect the philosophy behind this proposed rule.

Response: We address performance category scoring standards in section II.E.6.a.(2), II.E.6.a.(3), II.E.6.a.(4), and II.E.6.a.(5) of this final rule with comment period. We address our approach to a unified scoring system in MIPS at II.E.6.a.(1)(b) of this final rule with comment period. The weights of the MIPS performance categories to determine the final score are specified in section 1848(q)(5)(E) of the Act. Therefore, we must establish a formula for calculating the final score based upon the differing category weights as prescribed by the statute. To properly calculate a weighted score for each performance category, we must first calculate the performance category scores and then apply the statutory weights before adding the weighted scores together to determine the final score. The approach we have proposed meets the statutory requirements and will accurately reflect an eligible clinician's performance.

We have aligned the approach to scoring across the performance categories. Measures in the quality, cost, and the advancing care information performance categories are scored based on a point scale between 0 and 10. The measures and activities within each performance category are designed to measure performance on different aspects of high value healthcare within each performance category, therefore the performance requirements and scoring calculations within the performance categories are differentiated as appropriate.

Comment: Other commenters believed that there is no standard for quality care to form the basis for a MIPS final score. The commenters also stated that the quality care standards should be specific within a specialty.

Response: We believe the performance standards we are adopting represent appropriate standards of quality care for MIPS eligible clinicians to strive to meet. We will take the commenter's views on MIPS scoring methodology under advisement as we continue its

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

development.

After consideration of the comments, we are codifying our final score definition and final score formula with minor changes for accuracy and to change the labeling of composite performance score to final score. At §414.1305, final score means a composite assessment (using a scoring scale of 0 to 100) for each MIPS eligible clinician for a performance period determined using the methodology for assessing the total performance of a MIPS eligible clinician according to performance standards for applicable measures and activities for each performance category. The final score is the sum of each of the products of each performance category score and each performance category's assigned weight, multiplied by 100. At §414.1380(c), we finalize that each MIPS eligible clinician receives a final score of 0 to 100 points equal to the sum of each of the products of each performance category score and each performance category's assigned weight, multiplied by 100.

(a) Accounting for Risk Factors

Section 1848(q)(1)(G) of the Act requires us to consider risk factors in our scoring methodology. Specifically, that section provides that the Secretary, on an ongoing basis, shall, as the Secretary determines appropriate and based on individuals' health status and other risk factors, assess appropriate adjustments to quality measures, cost measures and other measures used under MIPS and assess and implement appropriate adjustments to payment adjustments, final scores, scores for performance categories or scores for measures or activities under the MIPS. In doing this, the Secretary is required to take into account the relevant studies conducted under section 2(d) of the IMPACT Act of 2014 and, as appropriate, other information, including information collected before completion of such studies and recommendations. ASPE is conducting studies on the issue of risk adjustment for socioeconomic status on quality measures and cost measures as required by section 2(d) of the IMPACT Act and expects to issue a report

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to Congress in October 2016. We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking. We also note that several MIPS measures, as appropriate, include risk adjustment in their measure specifications. For example, outcome measures in the quality performance category generally have risk adjustment embedded in the measure calculation specification, while process measures generally do not. Similarly, in the cost performance category, the proposed total per capita costs for all attributed beneficiaries measure is adjusted for demographic and clinical factors. That measure also has a specialty adjustment that is applied after the measure calculation to account for differences in specialty mix within a practice. The MSPB measure and other cost measures have different risk adjustments that are specific to the individual measure. For the transition year of MIPS (MIPS payment year 2019), for the quality and cost performance categories, we proposed to use the measure-specific risk adjustment for all measures (where applicable), as well as the additional specialty adjustment for the total per capita costs for all attributed beneficiaries.

We invited public comments on this proposal. For discussion of comments specific to risk adjustment for sociodemographic and/or socioeconomic factors we refer readers to section II.E.5.b.(6) of this final rule with comment period.

The following is summary of the comments we received regarding our proposal to use the measure-specific risk adjustment for all measures (where applicable), as well as the additional specialty adjustment for the total per capita costs for all attributed beneficiaries.

Comment: Several commenters suggested that CMS undertake additional specialty adjustments to compare specialists and similarly situated eligible clinicians. These commenters believe CMS should group and compare MIPS eligible clinicians by patient profile rather than comparing all eligible clinicians to one another.

Response: We have previously reviewed the option to segment eligible clinicians'

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measurement and scoring across geography, specialty, patient mix and other criteria. Such an approach may provide an advantage to certain eligible clinician types who historically have scored lower on performance measures. However, we are promoting and incentivizing high performance and identified the scoring approach as best suited for this purpose. Additionally, because we have aimed to make MIPS scoring simple to understand, we decided not to implement a complex system with multiple benchmarks for sub-groups.

Comment: Many commenters expressed concern that under MIPS, eligible clinicians caring for poor and/or clinically complex patients will be unfairly penalized when compared with physicians caring for healthier patients. As with socioeconomic status, commenters believe MIPS eligible clinicians with higher risk patients should not be penalized for poor outcomes due to factors outside of their control. These commenters recommended that CMS risk adjust for clinical severity and complex patients.

Response: We have incorporated specialty adjustment into the total per capita cost measure under the cost performance category, which will account for specialties focused on high-cost procedures. While we agree certain patients with additional comorbidities often require additional care, we are concerned additional adjustment for clinical severity may have a tendency to mask poor performance. We will closely examine the ASPE studies when they are available and incorporate findings, along with additional sources of valid information, and incorporate them as feasible and appropriate through future rulemaking.

Comment: Several commenters recommended that CMS adjust for specifically rural-relevant socio-demographic factors. One commenter referenced the 2014 Update of Rural-Urban Chartbook that provides data on rural areas and riskier behaviors and pointed out that the Congress provides cost based reimbursement in rural settings in recognition of the additional costs of providing low volume services.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We appreciate commenter feedback on the role of rural relevant socio-demographic factors and will consider this information for future rulemaking. MIPS is intended to support the larger objective of ensuring excellent care for patients regardless of their geographic area. We will engage in further study to gauge the appropriateness of risk adjusting for sociodemographic factors, including those specific to rural populations, by reviewing the findings of the ASPE studies when they are available, along with other sources of information. In addition, we will actively monitor MIPS scoring outcomes to provide fair treatment for MIPS eligible clinicians serving rural areas.

Comment: One commenter believes CMS should release the actual variables, coefficients and equations used for risk adjustment.

Response: We have and will continue to publicly release information regarding our approach to risk adjustment for measures. However; as the variables and coefficients are frequently revised to improve system accuracy and efficiency, it would not be practical to provide this information of this type in a regulation.

Comment: One commenter recommended that CMS require reporting mechanisms that allow stratification by demographic characteristics; and also add age to the list of demographic factors.

Response: Calculation of performance by subgroup may be one way to identify and measure disparities, and could potentially help meet the objectives under the improvement activities subcategory “Achieving Health Equity”. We may consider such an approach in future rulemaking as we review approaches and recommendations, such as those from ASPE, for including sociodemographic evaluation in CMS programs.

After consideration of the comments, we are finalizing our proposal for the quality and cost performance categories to use the measure-specific risk adjustment for all measures (where

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

applicable), as well as the additional specialty adjustment for the total per capita costs measure.

Cost measures in the cost performance category are risk adjusted as previously discussed in detail at 77 FR 69317 through 69318 and referenced in section II.E.5.e.(3). Measures finalized for MIPS (see Tables A through D in the Appendix) may be risk adjusted as described in the measure specification using statistical processes to identify and adjust for extraneous variables not associated with care. However, many quality measures are process measures for which the measure outcome is not subject to influence by factors outside the eligible clinicians' control.

## (2) Final Score Performance Category Weights

### (a) General Weights

Section 1848(q)(5)(E)(i) of the Act specifies weights for the performance categories included in the MIPS final score: in general, 30 percent for the quality performance category, 30 percent for the cost performance category, 25 percent for the advancing care information performance category, and 15 percent for the improvement activities performance category. However, that section also specifies different weightings for the quality and cost performance categories for the first and second years for which the MIPS applies to payments. Section 1848(q)(5)(E)(i)(II)(bb) of the Act specifies that for year 1, not more than 10 percent of the final score will be based on the cost performance category and for year 2, not more than 15 percent will be based on cost performance category. Under section 1848(q)(5)(E)(i)(I)(bb) of the Act, the weight of the quality performance category for each of the first 2 years will increase by the difference of 30 percent minus the weight specified for the cost performance category for the year.

We have proposed the performance category weights for the first MIPS payment year of 2019. In section II.E.5.e.(2) of the proposed rule (81 FR 28198), we proposed to set the cost performance category weight at 10 percent for the 2019 payment year and 15 percent for the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

2020 payment year. Correspondingly, in section II.E.5.b.(2), we proposed to set the quality performance category weight to 50 percent for the 2019 payment year and 45 percent for the 2020 payment (81 FR 28185). The quality performance category weight proposal is based on the 30 percent required by statute for the quality performance category plus 30 percent minus the weight of the cost performance category, as required by section 1848(q)(5)(E)(i)(I)(bb) of the Act. As specified in section 1848(q)(5)(E)(i) of the Act, the weights for the other performance categories are 25 percent for the advancing care information performance category; and 15 percent for the improvement activities performance category. Section 1848(q)(5)(E)(ii) of the Act provides that in any year in which the Secretary estimates that the proportion of EPs (as defined in section 1848(o)(5) of the Act) who are meaningful EHR users (as determined under in section 1848(o)(2) of the Act) is 75 percent or greater, the Secretary may reduce the applicable percentage weight of the advancing care information performance category in the final score, but not below 15 percent, and adjust the weighting of the other performance categories. We refer readers to our policies concerning section 1848(q)(5)(E)(ii) of the Act in section II.E.5.g.(6)(e) of this final rule with comment period.

We received comments on the proposed weights of the MIPS performance categories which are addressed in section II.E.5.b.(2) for quality, section II.E.5.e.(2) for cost, section II.E.5.f.(2) for improvement activities and section II.E.5.g.(2) for advancing care information. As noted in those sections, many commenters expressed concern regarding the proposed weight for the cost performance category. After consideration of the comments and for the reasons stated in those sections, we are adjusting our proposed category weights for the first 2 years of MIPS. We are finalizing that for the first MIPS payment year (2019), the quality performance category will account for 60 percent of the final score and the cost performance category will account for 0 percent of the final score. We are also finalizing that for the second MIPS payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

year (2020), the quality performance category will account for 50 percent of the final score and the cost performance category will account for 10 percent of the final score. The final score weights for the improvement activities and advancing care information performance categories are specified in section 1848(q)(5)(E)(i) of the Act, and we did not propose to deviate from those values.

Table 29 summarizes the weights specified for each performance category under section 1848(q)(5)(E)(i) of the Act and in accordance with our final policies which are summarized at §414.1380(c)(1) and detailed at §§414.1330(b), 414.1350(b), 414.1355(b), and 414.1375(a).

**TABLE 29: Final Weights by Performance Category**

<b>Performance Category</b>	<b>2019 MIPS Payment Year</b>	<b>2020 MIPS Payment Year</b>	<b>2021 MIPS Payment Year and beyond</b>
Quality	60%	50%	30%
Cost	0%	10%	30%
Improvement Activities	15%	15%	15%
Advancing Care Information*	25%	25%	25%

\*The weight for advancing care information could decrease (not below 15 percent) if the Secretary estimates that the proportion of physicians who are meaningful EHR users is 75 percent or greater. The remaining weight would then be reallocated to one or more of the other performance categories.

**(b) Flexibility for Weighting Performance Categories**

Under section 1848(q)(5)(F) of the Act, if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician involved, the Secretary shall assign different scoring weights (including a weight of zero) for each performance category based on the extent to which the category is applicable and for each measure and activity based on the extent to which the measure or activity is applicable and available to the type of MIPS eligible clinician involved.

In section II.E.6.a (81 FR 28248-28268) and section II.E.5.g.(8) (81 FR 28230-28234) of the proposed rule, we describe scenarios where certain MIPS eligible clinicians might not receive

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

a performance category score in the quality, cost, or advancing care information performance categories. We proposed that in such scenarios we would use the authority under section 1848(q)(5)(F) of the Act to assign a weight of zero to the performance category and redistribute the weight for that performance category or categories as described in the next section.

Below we summarize these scenarios from the proposed rule. However, our transition year policies and modifications in this final rule to simplify scoring affect many of these scenarios, so we describe both the proposed scenario and how our final policies have impacted that scenario.

For the quality and cost performance categories, in the proposed rule (81 FR 28269-28270), we stated our belief that having sufficient measures applicable and available meant that we are able to reliably calculate a score for the measures that adequately captures and reflects the performance of the MIPS eligible clinician. For the quality and cost performance categories, we proposed in sections II.E.6.a.(2)(d) (81 FR 28254-28255), II.E.6.a.(3)(a) (81 FR 28259-28260), and II.E.6.a.(3)(d) (81 FR 28260-28261) of the proposed rule that we would not calculate a performance category score if a MIPS eligible clinician does not have any measures with the required case minimum or any measures with a sufficient number of MIPS eligible clinicians to create a benchmark. We had proposed that measures that do not meet the required case minimum or a sufficient number of MIPS eligible clinicians to create a benchmark would be excluded from scoring, and the MIPS eligible clinician would not receive a quality or cost performance category score. (Note, this situation is different from a MIPS eligible clinician who elects not to submit any quality measures. A MIPS eligible clinician who elects not to submit any quality measures would receive a quality performance category score of zero.) In our segment II.E.6.a.(2). of the final rule with comment period, we noted that this policy has changed for the quality performance category. We established a policy to assign 3 points for scenarios where a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinician has quality measures that do not meet case minimum thresholds, do not meet data completeness criteria, or do not have a benchmark. As we noted in those sections we believe that in the initial years of MIPS providing a set number of points for these types of measures rather than not scoring these measures will further incentivize clinicians' participation in the MIPS. We continue to believe MIPS eligible clinicians who would have no scored measures for a performance category under our proposals would not have sufficient measures applicable and available for that performance category; however, with the new measure scoring policy in the quality performance category, we do not anticipate as many MIPS eligible clinicians not having scored measures. Therefore, in almost all cases, we anticipate a MIPS eligible clinician would receive a quality performance category score. The only exception would be the rare circumstance that a MIPS eligible clinician does not have any measures that are relevant to the clinician's practice.

In the proposed rule, we anticipated that most MIPS eligible clinicians would select the measures for the quality performance category that are most relevant to their practice and that in most cases, the measures they select would meet the required case minimum. We planned to monitor measure selection trends under the performance category and would revise this policy if it appears MIPS eligible clinicians are reporting measures that are not relevant to their practice or measures that do not meet the required case minimum. With the new 3-point policy, we do not believe MIPS eligible clinicians would purposefully select measures with low case volume in order to avoid a score. Rather, we believe that the overwhelming majority of MIPS eligible clinicians aim to meet our performance criteria in the most straightforward manner possible. As described in II.E.5.b.(3)(a)(i) and II.E.6.a.(2)(d) of this final rule with comment period, we will continue to monitor the selection of measures and may adjust policies if we determine MIPS eligible clinicians are not reporting measures for which they can be scored.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

In the cost performance category, we believe MIPS eligible clinicians who are not attributed enough cases to be reliably measured should not be scored for the performance category. We have finalized in section II.E.5.e. of this final rule with comment period, the measures for the cost performance category; however, if a MIPS eligible clinician is not attributed a sufficient number of cases for a measure (in other words, has not met the required case minimum for the measure) or if a measure does not have a benchmark, then the measure will not be scored for that clinician in accordance with the final policy in section II.E.6.(a)(3) of this final rule with comment period. However, while we are scoring cost measures in the transition year of MIPS (MIPS payment year 2019), they are not contributing to transition year final scores as we have set the cost performance category weight to 0 percent in the transition year.

We refer readers to section II.E.5.g.(8) of this final rule with comment period for a detailed discussion of the scenarios in which a MIPS eligible clinician may not have sufficient measures applicable and available under the advancing care information performance category. For the improvement activities performance category, however, we envision that all MIPS eligible clinicians would have sufficient activities applicable and available and did not propose any scenario where a MIPS eligible clinician would not receive an improvement activities performance category score.

In addition to scenarios where a MIPS eligible clinician would have no scored measures for a performance category, we stated in the proposed rule that we believe there may be scenarios in which a MIPS eligible clinician would have too few scored measures under the quality performance category for us to reliably calculate a performance category score that is worth half the weight of the final score for the 2019 MIPS payment year. We proposed that if a MIPS eligible clinician has fewer than three scored quality measures (either submitted measures

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

or measures calculated from administrative claims data) for a performance period, we would consider the MIPS eligible clinician not to have a sufficient number of measures applicable and available for the 2019 MIPS payment year quality performance category weight and would therefore lower the weight of the quality performance category. In this situation, we stated in the proposed rule that the MIPS eligible clinician has a quality performance category score, but has data for only one or two scored measures, which is not a sufficient number of measures for the quality performance category because the quality performance category would constitute half of the final score for the 2019 MIPS payment year. In addition, as described in the next section, for MIPS eligible clinicians that are not scored on the cost or advancing care information performance category, we proposed to increase the weight of the quality performance category. For these reasons, we proposed that for the transition year of MIPS (MIPS payment year 2019), the quality performance category requires a sufficient number of measures to justify its weight in the final score. We noted we would reconsider this policy in future years as the weights for the performance categories change. We proposed that we would consider implementing a similar policy for the cost performance category for future years, but not for the transition year of MIPS based upon the lower weighting of the cost performance category.

In the proposed rule (81 FR 28186), we proposed for the quality performance category, generally, that MIPS eligible clinicians submit a minimum of six measures for scoring in MIPS. In addition, we proposed to include up to three population-based measures derived from claims data. As described in section II.E.6.a.(2) of the proposed rule (81 FR 28250-28259), a MIPS eligible clinician may submit a measure that is not scored, either because the measure did not meet the required case minimum to be reliably measured or because fewer than 20 MIPS eligible clinicians with sufficient volume submitted a measure through a similar reporting mechanism and a benchmark could not be created for the performance or baseline period. We reiterated that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

a measure that is not scored due to not meeting the required case minimum or lack of a measure benchmark, is different than a required measure that is not reported. Any required measure that is not reported or reported with in a way that does not meet the data completeness requirements would receive a score of zero points and would be considered a scored measure. In section II.E.5.b.(6), we have modified our final policies to reflect that only one of the three population-based measures is being finalized. Additionally, in section II.E.6.a.(2)(d), we have modified our approach for quality measures that fall below case minimum requirements, data completeness thresholds and measures without a benchmark to include a 3-point measure floor.

We stated in the proposed rule that we are concerned that if a large percentage of the expected measures are not able to be scored due to not meeting the required case minimums or a missing benchmark, then just one or two measures would contribute disproportionately to the final score because the quality performance category score is worth 30 to 50 percent (depending on the year) of the final score under section 1848(q)(5)(E)(i) of the Act. We did not believe a score for one or two quality measures can capture all the elements of quality performance during a performance period. We believed the lack of a sufficient number of measures for scoring limits the value of quality performance measurement toward the final score. Therefore, we proposed that if a MIPS eligible clinician has only two scored measures (including both submitted measures and measures derived from administrative claims data) to reduce the weight of the quality performance category by one-fifth (for example, from 50 percent to 40 percent in year 1) and redistribute the weight (for example, 10 percent in year 1) proportionately to the other performance categories for which the MIPS eligible clinician did receive a performance category score. If a MIPS eligible clinician has only one scored quality measure, then we proposed to reduce the weight of the quality performance category by two-fifths (for example, from 50 percent to 30 percent in year 1) and redistribute the weight (for example, 20 percent in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

year 1) proportionately to the other performance categories for which the MIPS eligible clinician did receive a performance category score. Lowering the weight of the quality performance category would be consistent with the relatively low percentage of expected quality measures that are able to be scored.

We requested comment on these proposals to identify MIPS eligible clinicians without sufficient measures and activities applicable and available and our proposals to reweight those performance categories. We also sought comment on alternative methods for reweighting performance categories for MIPS eligible clinicians without sufficient measures and activities in certain performance categories. We seek to ensure that reweighting would not cause an eligible clinician to be either advantaged or disadvantaged due to a lack of sufficient measures and activities applicable and available, and a corresponding inability to generate a score for a certain performance category.

The following is summary of the comments we received regarding our proposal to consider MIPS eligible clinicians with fewer than three scored quality measures as having insufficient measures applicable and available for the 2019 MIPS payment year quality performance category and to, therefore, lower the weight of the quality performance category.

Comment: Several commenters were opposed to our proposal to reduce the weight of the quality performance category because they were concerned how this might impact specialty clinicians with only one or two measures available to report. For example, these commenters were concerned that continuous shifts in the weights for calculating their final score will make it more difficult to determine goals as they transition to subsequent reporting periods.

Response: We understand the commenters' concerns with reducing the weight of the quality category for those MIPS eligible clinicians who may lack a sufficient number of applicable and available quality measures. Our proposal considered the potential downside of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

basing at least half of the final score on less than three measures when other performance categories with additional measures were applicable to these MIPS eligible clinicians. After consideration of these comments and other final policies in this final rule with comment period, we are seeking to simplify our approach in the initial years of MIPS to ensure clarity and to encourage eligible clinicians to participate in MIPS and report their quality data. As a result, we intend to maintain a consistent weight for the quality performance category and will score all measures that are submitted or calculated for the MIPS eligible clinician. Required measures that are not submitted will receive a score of zero points.

We will not finalize our proposed policy to reduce and redistribute the weight of the quality performance category if only one or two measures are scored. We will finalize with modification our proposed policy to reduce and redistribute the quality performance category weight if a MIPS eligible clinician has no scored measures for the quality performance category for the transition year (MIPS payment year 2019), although we believe this scenario will be unlikely. We have modified our approach because, under our policies for the quality performance category for the transition year, we believe it is less likely that a MIPS eligible clinician will have only 1 or 2 scored measures. As discussed in section II.E.6.a.(2), all quality performance category measures that are submitted receive at least 3 points. In addition, any required measure that is not submitted receives a score of 0 points. Therefore, a MIPS eligible clinician submitting data as an individual, who has at least 6 measures applicable and available, who submits one measure is still scored on six measures. One measure receives a score of at least 3 points and the other five measures receive zero points. With this adjustment in the quality scoring, we believe the number of instances where a MIPS eligible clinician has fewer than 3 scored measures will be reduced. Eliminating the proposed reduction and redistribution of the weight of the quality performance category if only one or two measures are scored further

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

simplifies scoring for the transition year. We refer readers to section II.E.6.b.(2)(c) of this final rule with comment period for discussion of how the quality performance category weight will be redistributed in instances where a MIPS eligible clinician is not scored on any quality measures and receives a null score in the quality performance category.

In Table 17 in section II.E.6.a.(2)(c), we summarize two classes of quality measures for the quality performance category: “class 1” are those measures for which performance can be reliably scored against a benchmark and “class 2” are measures for which performance cannot be reliably scored against a benchmark. For the transition year (MIPS payment year 2019), we have modified our proposed approach on how we will score measures submitted that are unreliable because they are below the case minimum requirements, or lack a benchmark or do not meet data completeness criteria. These measures will not be scored based on performance against a benchmark, but will receive an automatic three points. We believe this policy will simplify quality performance category scoring. We want to ensure that every clinician that submits quality data will receive a quality performance category score, even if the quality data submitted is class 2 measures. This is particularly important in the transition year because with a minimum 90-day performance period, we anticipate more MIPS eligible clinicians will submit measures below the case minimum requirements. We selected three points because we did not want to provide more credit for reporting a measure than cannot be reliably scored against a benchmark than for measures for which we can measure performance against a benchmark. Again, any measure that was not submitted would also receive a zero score.

As noted in this final rule with comment period, we have decided not to finalize our proposed approach to reduce the weight of the quality performance category in the final score if only one or two measures are scored for the following reasons. First, we want to create an opportunity for all MIPS eligible clinicians to participate and succeed in MIPS through minimal

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

quality performance category measure submission during the transition year. Second, we want to create a thoughtful “ramp” into the program for participants that is sensitive to stakeholder concerns. Many commenters in section II.E.6.a.(2)(c) requested that we provide “credit” for measures that were submitted that did not meet the quality submission criteria. In addition to scoring measures on performance, we will give at least 3 points for each measure that is submitted to MIPS, even if these measures are class 2 measures. Measures that are not submitted receive a score of zero. As a result of this policy, we think the number of MIPS eligible clinicians with only one or two scored measures will decrease and that removing the proposed reduction and redistribution of the weight of the quality performance category if only one or two measures are scored further simplifies the MIPS scoring for the transition year. As we gain experience with the MIPS, we will revisit these approaches in future rulemaking. For clarity we refer readers once again to section II.E.6.b.(2)(c) of this final rule with comment period for discussion of how the quality performance category weight will be redistributed in instances where a MIPS eligible clinician is not scored on any quality measures and receives a null score in the quality performance category.

Comment: Commenters requested clarification on how we plan to identify MIPS eligible clinicians without sufficient measures and activities and whether reweighting will still allow for a maximum final score.

Response: We note that the reweighting policies ensure that all MIPS eligible clinicians will receive a final score between 0 and 100 points. The only difference is how much the individual performance category scores contribute to the final score.

In response to the request for clarification on how we would identify clinicians without sufficient measures and activities, we refer readers to section II.E.5.b.(3)(a)(i) and II.E.6.a.(2)(d) of this rule for a discussion of our validation process to assess whether measures for the quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category are applicable and available, section II.E.5.g.(8) of this rule for a discussion of when measures for the advancing care information performance category may not be applicable and available, and section II.E.6.a.(3) of this rule for a discussion of when measures for the cost performance category may not be applicable and available. As we stated in the proposed rule, we believe the activities specified for the improvement activities performance category will always be applicable and available to all MIPS eligible clinicians.

Comment: A commenter stated they did not believe the quality category should be reweighted when a MIPS eligible clinician has fewer than three quality measures because the commenter believes that all MIPS eligible clinicians should be required to report six measures and that specialists could find at least six quality measures by using cross-cutting measures.

Response: We share the commenter's goal to have MIPS eligible clinicians report at least six measures. However, we also recognize that not every MIPS eligible clinician may have six measures relevant to their practice. We note that if a MIPS eligible clinician is able to report six measures, yet submits fewer measures, then the MIPS eligible clinicians would receive a zero for the measures that were not submitted.

Comment: Multiple commenters supported our proposal for lowering the weight of the quality performance category for MIPS eligible clinicians with fewer than three applicable and available scored measures.

Response: We appreciate the support from commenters; however, as discussed in this final rule with comment period, in a desire to simplify the scoring process, we are not finalizing the proposal to reduce and redistribute the quality performance category weight for MIPS eligible clinicians with only one or two scored measures. As discussed in section II.E.6.b.(2)(c) of this final rule with comment period, we will only reduce and redistribute the weight of the quality performance category when a MIPS eligible clinician has no scored quality measures,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

which we believe will be rare.

Comment: Other commenters disagreed with our proposal to redistribute weight from the quality performance category to other performance categories when fewer than three scored measures are available because these commenters believed that the intent of the MACRA was to limit the weight given to cost and that any redistribution should not include an increase in the weight of cost in the final score.

Response: As a result of other final policies, the cost category is weighted to zero percent in the final score for the transition year as detailed in section II.E.6.a.(3)(d), therefore its weight is not eligible for redistribution to the other performance categories. We also believe section 1848(q)(5)(F) of the Act gives the Secretary discretion to redistribute weight to the cost performance category and thus disagree with commenters that weight should never be redistributed to that category.

After consideration of the comments, and for the reasons explained in our responses above, we are not finalizing our proposal to reduce and redistribute the weight of the quality performance category when a MIPS eligible clinician has only one or two scored quality measures. Maintaining a consistent quality performance category weight whenever at least one measure can be scored will increase simplicity and predictability of scoring for MIPS eligible clinicians. We may revisit this policy at a future date through rulemaking. See section II.E.6.b.(2)(c) of this final rule with comment period for discussion of how we will reduce and redistribute the weight of the quality performance category to other performance categories when a MIPS eligible clinician has no scored measures in the quality performance category.

#### (c) Redistributing Performance Category Weights

We proposed at §414.1380(c)(2) to redistribute the weights of the performance categories for MIPS eligible clinicians when there are not sufficient measures and activities applicable and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

available to them. We proposed to redistribute the weights of the performance categories in the following situations.

If the MIPS eligible clinician does not receive a cost or advancing care information performance category score, and has at least three scored measures (either submitted measures or those calculated from administrative claims) in the quality performance category, then we proposed to reassign the weights of the performance categories without a score to the quality performance category. We believed this policy was appropriate for several reasons. First, section 1848(q)(5)(E)(i)(I)(bb) of the Act redistributes weight from the cost performance category to the quality performance category in the first 2 years of MIPS. This proposal is consistent with that redistribution logic. In addition, MIPS eligible clinicians have experience reporting quality measures through the PQRS program, and measurement in this performance category is more mature. Finally, for the 2019 MIPS payment year, quality performance would be worth at least half of the final score. By requiring the MIPS eligible clinician to have at least three scored quality measures, we believe the quality performance category would be robust enough to support more weight reassigned to it than other performance categories. we stated that we may revisit this policy in future years as the weight for the cost performance category increases and the weight for the quality performance category decreases.

We also proposed an alternative that does not reassign all the weight to the quality performance category, but rather reassigns the weight proportionately to each of the other performance categories for which the MIPS eligible clinician has received a performance category score.

We requested public comments on the proposal to reassign the weights to the quality performance category, as well as the alternate proposal to redistribute proportionately to other performance categories.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

If the MIPS eligible clinician has fewer than three scored measures in the quality performance category score, then we proposed to reassign the weights for the performance categories without scores proportionately to the other performance categories for which the MIPS eligible clinician has received a performance category score. We requested comment on this proposal.

Finally, because the final score is a composite score, we stated in the proposed rule that we believe the intention of section 1848(q)(5) of the Act is for MIPS eligible clinicians to be scored based on multiple performance categories. Basing a final score on a single performance category, even a robust and familiar performance category like quality, would frustrate that intent. In our proposals, improvement activities is the only performance category which would always have a performance category score. We were particularly concerned about the possibility that a MIPS eligible clinician might, for the reasons discussed above, not have sufficient measures applicable and available for the quality, cost, and advancing care information performance categories, and would only receive a score for the improvement activities performance category. The improvement activities performance category is based on activities that are reported by attestation, not on measured performance. In addition, because the improvement activities performance category is not as mature as the other performance categories, each of which include certain aspects of existing CMS programs, we were unsure how much variation we will have in the improvement activities performance category. We did not believe it would be equitable to allow MIPS eligible clinicians that attest to receive the maximum points for that performance category and then base the final score solely on the improvement activities performance category. Such a scenario may result in higher final score and MIPS adjustment factors for some MIPS eligible clinicians based solely on the improvement activities performance category, while other MIPS eligible clinicians are measured based on their

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance under the other performance categories. Therefore, we proposed that if a MIPS eligible clinician receives a score for only one performance category, we would assign the MIPS eligible clinician a final score that is equal to the performance threshold described in section II.E.7.c of the proposed rule (81 FR 28273), which means the eligible clinician would receive a MIPS payment adjustment factor of 0 percent for the year. We anticipated this proposal would affect very few MIPS eligible clinicians in year 1 and even fewer in future years as more eligible clinicians are able to report on and receive scores for more of the performance categories.

We requested public comment on this proposal.

The following is summary of the comments we received regarding our proposal to reassign performance category weights to the quality performance category when an eligible clinician cannot be scored in a category and has at least three scored measures in the quality performance category.

Comment: Multiple commenters supported CMS' proposal to distribute the weights for the advancing care information and cost performance categories to the quality performance category in cases where the category is not scored for an eligible clinician.

Response: We agree with the commenters. By redistributing weight to the quality performance category, we are providing a clear scoring approach for eligible clinicians who do not receive a score in another performance category. This approach is also in line with section 1848(q)(5)(E)(i) of the Act, which requires that we redistribute weight from the cost category to the quality category during the first 2 years of MIPS. We would like to note, that the cost performance category is weighted at 0 percent for the transition year (MIPS payment year 2019), so the cost performance category weight will not need to be redistributed.

Comment: Several commenters recommended that CMS implement the alternate reweighting proposal (the proportional reassignment of weights to the remaining performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

categories) for MIPS eligible clinicians that receive a zero weight in the advancing care information and cost performance categories and have at least three scored quality measures. Commenters who supported this approach did so because they were concerned about disproportionate weighting in the quality performance category.

Response: MIPS eligible clinicians have prior experience with quality reporting through PQRS and VM. Also, as discussed in section II.E.6.a.(3)(d) of this final rule with comment period, we are weighting the cost performance category at zero percent for the transition year of MIPS (MIPS payment year 2019) and assigning its weight to the quality performance category. As a result, for the transition year, there will be no need to redistribute the weight of the cost performance category if there are not sufficient measures applicable and available under that category. In the event that an eligible clinician does not receive a score for advancing care information, it would not be appropriate to allocate substantial additional weight to improvement activities in the transition year of MIPS before we have gained additional experience with the improvement activities performance category. While we understand commenter concerns about placing additional weight in the quality category, section 1848(q)(5)(E)(i) of the Act seems to favor an approach where quality is given substantial weight in the final score during the first 2 years of MIPS.

Comment: Several commenters expressed concern that both options for reweighting the remaining performance categories would increase the importance of the quality performance category in determining the final score. These commenters were concerned that allocating additional weight within the final score to the quality performance category could become detrimental to eligible clinicians who do not have a sufficient number of quality measures applicable to their practice.

Response: While we understand commenter concerns about allocating additional weight

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to the quality category, we believe our approach of redistributing the weight to quality is consistent with section 1848(q)(5)(E)(i) of the Act, which gives quality substantial weight in the final score during the first 2 years of MIPS. In addition, many eligible clinicians will have prior experience reporting quality measures to PQRS; while, on the other hand, improvement activities is a new performance category without any reporting history. With our transition year policies, we anticipate that the advancing care information performance category will be the one performance category that may need to be reweighted if there are not sufficient measures applicable and available to some MIPS eligible clinicians, as discussed in section II.E.5.g.(8) of this final rule with comment period. Therefore, reallocating additional weight to the quality performance category presents a clear option for rebalancing the final score when the advancing care information performance category is weighted at zero percent.

Comment: Several commenters suggested that CMS work with affected physicians who have insufficient measures and activities and with physician organizations to determine the best method of reweighting to accommodate the unique needs of various practices.

Response: We appreciate that developing a single reweighting approach may not satisfy all stakeholders. However, we are not prepared to develop specialty-specific reweighting schema at this time, and doing so prematurely would impair our ability to maintain simplicity and clearly articulate scoring expectations to MIPS eligible clinicians. We may reassess our approach in future years and do intend to continue our engagement with physician organizations and other stakeholders to incorporate their feedback as appropriate in future rulemaking.

Comment: Multiple commenters recommended that MIPS eligible clinicians who are unable to report performance categories other than improvement activities should have the option to increase the weight of the improvement activities performance category. These commenters believed that this approach would provide greater flexibility for MIPS eligible clinicians to be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measured on activities relevant to their practice.

Response: The weights for the performance categories are prescribed by statute in section 1848(q)(5)(E) of the Act or determined by the Secretary in accordance with section 1848(q)(5)(F) of the Act. The statute, as written, would not allow for an approach such as the commenters suggest.

Comment: Many commenters stated that when there are not sufficient measures and activities applicable and available for a MIPS eligible clinician in a performance category, the most appropriate action would be to score the physician as “meets performance standard”, and that the MIPS eligible clinician should be assigned the median score for the performance category. These commenters believed that reweighting may ultimately disadvantage MIPS eligible clinician types who may tend not to have an advancing care information performance category score.

Response: While we recognize the simplicity of the approach proposed by commenters, it would not be permissible under statute. Section 1848(q)(5)(F) of the Act stipulates the Secretary shall assign different scoring weights (including a weight of 0) if there are not sufficient measures and activities applicable and available to the MIPS eligible clinicians. We do not believe that assigning a MIPS eligible clinician a score of “meets performance standard” would be consistent with that statutory requirement. Redistributing final score weight to performance categories in which a MIPS eligible clinician has engaged allows us to produce a composite assessment between 0 and 100 and maintains and eligible clinician’s ability to reach 100 percent of the final score even when they cannot be scored in all categories.

Comment: We received comments from hospital-based eligible clinicians who did not agree with our proposal to reweight their advancing care information performance category to zero in their final score and to reallocate the performance category weight to the quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance category based upon the Secretary's authority under section 1848(q)(5)(F) of the Act. These commenters did not believe the resulting final score would be representative of their performance in MIPS. The commenters further stated that, in combination with reweighting the cost performance category to zero, doing so for the advancing care information performance category would shift a large and disproportionate amount of weight to the quality performance category. This would result in significant difference in total quality performance category scores for minor variances in quality measure performance, making it very difficult to earn a high score in the category and in the final score. For example, a score of 99.9 percent versus 100 percent for a quality measure would make a larger difference in the overall quality performance category score if the weight of that performance category is larger than for those MIPS eligible clinicians who also have the opportunity earn points in the advancing care information performance category. The commenter suggested that an alternate method of reweighting and redistributing the advancing care information performance category score be considered. For example, the commenter suggested that the score distribution be across multiple performance categories and not just quality.

Response: As discussed in section II.E.5.g.(8)(a)(i) of this final rule with comment period, we believe there may not be sufficient measures applicable and available to hospital-based MIPS eligible clinicians under the advancing care information performance category of MIPS.

The cost performance category is weighted at zero percent in the final score under our transition year policies. As discussed earlier in this section, we believe it would not be appropriate to allocate substantial additional weight to improvement activities in the transition year of MIPS before we have gained additional experience with the improvement activities performance category. Therefore, while we understand the commenters concerns about placing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

additional weight in the quality category, section 1848(q)(5)(E)(i) of the Act seems to favor an approach where quality is given substantial weight in the final score during the first 2 years of MIPS. We may revisit this policy in future years.

After consideration of the comments, we are codifying at §414.1380(c)(2) that we will assign different weights than the ones listed in §414.1380(c)(1) when we determine that there are not sufficient measures and activities applicable and available to MIPS eligible clinicians.

For the transition year (MIPS payment year 2019), we are codifying with modification our proposal to redistribute the weight of the cost and advancing care information performance categories to the quality performance category when there are not sufficient measures applicable and available to a MIPS eligible clinician under the cost and advancing care information performance categories and thus the clinician does not receive a score for those performance categories. We are not finalizing the requirement that the quality performance category have a minimum of three scored measures in order to redistribute the weight of the cost and advancing care information performance categories to the quality performance category. Maintaining a consistent quality performance category weight whenever at least one measure can be scored will increase simplicity and predictability of scoring for MIPS eligible clinicians while learning the program.

The following is a summary of the comments regarding our proposal to reduce the weight of the quality performance category and redistribute the amount by which it is reduced to the other performance categories, in the event a MIPS eligible clinician has fewer than three scored measures in the quality performance category.

Comment: Several commenters stated that if a MIPS eligible clinician lacks sufficient measures to report into the quality performance category, then CMS should assign a neutral final score that meets the performance threshold and thus a 0 percent update.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: If there are not sufficient measures applicable and available under the quality performance category, section 1848(q)(5)(F) of the Act directs the Secretary to assign different scoring weights for the performance categories. As stated above, we are not finalizing our proposal to reduce and redistribute the quality performance category weight to other categories if a MIPS eligible clinician has only one or two scored quality measures. We believe our final policies will reduce the instances where a MIPS eligible clinician does not receive any quality performance category score by applying a 3-point minimum score for all quality measures reported in the quality performance category (see section II.E.6.a.(2)(b) of this final rule with comment period). In event that a MIPS eligible clinician is not scored in the quality performance category because there are not sufficient measures applicable and available, for the transition year (MIPS payment year 2019), we will redistribute the 60 percent weight of the quality performance category so that the performance category weights are 50 percent for advancing care information and 50 percent for improvement activities.

Comment: Multiple commenters recommended that CMS simplify the final score scoring methodology and our proposals for reweighting to make it easier for MIPS eligible clinicians to understand how to maximize their score. Commenters recommended that CMS balance the value of requiring MIPS eligible clinicians to understand various reweighting scenarios versus clearly laying out the results for MIPS eligible clinicians reporting the data they have available. Commenters also recommended that CMS maintain the weight of the quality category at 50 percent, as MIPS eligible clinicians may be unfamiliar with the improvement activities and advancing care information performance categories. Finally, commenters believed that a streamlined weighting methodology will improve fairness in the absence of greater historical data for certain performance categories.

Response: We understand the commenters' concerns with complexity in our approach to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reweighting performance category weights when a MIPS eligible clinician cannot be scored in one or more categories. In response to these comments and other finalized policies, we are simplifying our approach in the first 2 years of MIPS to ensure clarity and to encourage MIPS eligible clinicians to report their quality data. As discussed in section II.E.5.e.(2) of this final rule with comment period, we are reducing the cost performance category weight to zero percent for the transition year (MIPS payment year 2019) only. We are also making adjustments to quality scoring by providing a 3-point floor for all reported quality measures (see II.E.6.a.(2) of this final rule with comment period). We are also not finalizing our proposal to reduce and redistribute the weight of the quality performance category if MIPS eligible clinicians have only one or two scored quality measures. For the transition year (MIPS payment year 2019), we will redistribute the 60 percent weight of the quality performance category so that the performance category weights are 50 percent for advancing care information and 50 percent for improvement activities in the event that a MIPS eligible clinician is not scored in the quality performance category because there are not sufficient measures applicable and available. All of these modifications will help provide stability and predictability in the MIPS final score methodology.

After consideration of the comments, and for the reasons discussed in our responses above, we are finalizing a modification of our proposal to reduce the weight of the quality performance category and redistribute the amount by which it is reduced to the other performance categories if the eligible clinician has fewer than three scored quality measures. MIPS eligible clinicians will receive a quality performance category score as long as they are scored on at least one quality measure. We believe it is unlikely that a MIPS eligible clinician will not receive a score for at least one quality measure as a result of our final policy for the transition year to provide a 3-point floor for all reported quality measure in the quality performance category (see II.E.6.a.(2) of this final rule with comment period). In the event a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinician is not scored on at least one measure in the quality performance category because there are not sufficient measures applicable and available, for the transition year (MIPS payment year 2019), we will redistribute the 60 percent weight of the quality performance category so that the performance category weights are 50 percent for advancing care information and 50 percent for improvement activities. We are finalizing this policy for the MIPS payment year 2019 and will revisit this approach for later years through future rulemaking. With the 3-point floor policy, we anticipate almost all MIPS eligible clinicians will have a quality performance category score. We believe that only in rare circumstances would a MIPS eligible clinician have no applicable and available quality measures. This approach is similar to our proposal but takes into account our final policy to weight the cost performance category at 0 percent in the transition year of MIPS and responds to commenter requests for additional simplicity in our policies for reweighting the performance categories. Table 30 summarizes these final policies.

The following is summary of the comments we received regarding our proposal to assign MIPS eligible clinicians with only one scored performance category a final score that is equal to the performance threshold.

Comment: Several commenters expressed agreement with CMS' proposal to assign a final score that is equal to the performance threshold, resulting in a zero percent adjustment, to MIPS eligible clinicians who receive a score for only one performance category.

Response: We agree with commenters and will finalize the proposal to define a final score as more than one performance category and to assign a final score at the performance threshold to a MIPS eligible clinician who has only one performance category score.

Comment: A few commenters suggested that the minimum number of performance categories for a final score should be based on the assumption that most participants will

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

complete the improvement activities performance category and the advancing care information performance category, and will be able to report on at least one of the remaining cost and quality performance categories.

Response: We agree that a large number of MIPS eligible clinicians will be able to participate in all performance categories. However, there are instances we have identified when MIPS eligible clinicians would not receive an advancing care information performance category score, or a cost performance category score; therefore, we believe it would be inappropriate to not have policies in place for those MIPS eligible clinicians that do not have measures applicable and available in all performance categories.

After consideration of the comments, we are finalizing our proposal to assign MIPS eligible clinicians with only one scored performance category a final score that is equal to the performance threshold. We note that with the scoring changes to the quality performance category, we do anticipate that almost all MIPS eligible clinicians will have performance category scores for both quality and improvement activities.

Based upon the policies we are finalizing; we summarize in Table 30 the potential reweighting scenarios for the transition year of MIPS (MIPS payment year 2019):

**TABLE 30: Performance Category Redistribution Policies for the Transition Year (MIPS payment year 2019)**

<b>Performance Category</b>	<b>Weighting for 2019 MIPS Payment Year</b>	<b>Reweight Scenario If No Advancing Care Information Performance Category Score</b>	<b>Reweight Scenario If No Quality Performance Category Score</b>
Quality	60%	85%	0%
Cost	0%	0%	0%
Improvement Activities	15%	15%	50%
Advancing Care Information	25%	0%	50%

We do not include a scenario where a MIPS eligible clinician does not receive an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

improvement activities performance category score. MIPS eligible clinicians that do not submit any improvement activities data receive a zero percent score for that performance category.

## 7. MIPS Payment Adjustments

### a. MIPS Payment Adjustment Identifier and Final Score Used in the MIPS Payment Adjustment Calculation

#### i. MIPS Payment Adjustment Identifier

As we described in section II.E.2. of the proposed rule (81 FR 28271), we proposed to allow MIPS eligible clinicians to measure performance as an individual, as a group defined by TIN, or as an APM Entity group using the APM scoring standard. However, for purposes of the application of the MIPS payment adjustment factors to payments in accordance with section 1848(q)(6)(E) of the Act (referred to as the MIPS payment adjustment), we proposed to use a single identifier, TIN/NPI, for all MIPS eligible clinicians, regardless of whether the TIN/NPI was measured as an individual, group or APM Entity group. In other words, a TIN/NPI may receive a final score based on individual, group, or APM Entity group performance, but the MIPS payment adjustment would be applied at the TIN/NPI level.

We proposed to use the single identifier, TIN/NPI, for the MIPS payment adjustment for several reasons. First, the final eligibility status of some clinicians would not be known until after the performance period ends. For example, the calculations determining which clinicians would be excluded from MIPS, such as identifying clinicians that are QPs or are below the low-volume threshold, occur after the performance period ends. Using TIN/NPI would allow us to correctly identify which TIN/NPIs are still MIPS eligible clinicians after the exclusion criteria have been applied.

Second, the identifiers for quality measurement are not mutually exclusive, and using TIN/NPI to apply the MIPS payment adjustment would allow us to resolve any inconsistencies

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that arise from the measurement identifiers. For example, a TIN may have 40 percent of its eligible clinicians participating in a MIPS APM and the remaining 60 percent are not participating in any APM. The TIN elects to submit performance information for all the eligible clinicians in the TIN, including those that are participating in the MIPS APM, so that it can ensure all of its eligible clinicians are being measured in MIPS. We cannot simply use the APM Entity and TIN identifiers because in this case, we either have eligible clinicians with duplicative data and overlapping scores, or we have portions of the measurement identifier carved out if we eliminate the overlap. In our example, the eligible clinicians participating in the MIPS APM would have data for two final scores (one based on the APM Entity group performance and one based on the group TIN performance). The eligible clinicians not participating in the MIPS APM would have only one final score (one based on the group TIN performance). Applying the MIPS payment adjustment at the TIN/NPI level provides us the flexibility to correctly identify and resolve the conflicts emerging when measurement identifiers overlap. The TIN/NPI identifier is mutually exclusive on all of our measurement identifier options; therefore, we believe this identifier can be consistently used for individual, group, or APM scoring standard identifiers. We refer readers to 81 FR 28271 for a discussion of identifiers and our proposals related to them.

The following is summary of the comments we received regarding our proposal to use the TIN/NPI combination as the MIPS payment adjustment identifier.

Comment: Some commenters opposed using the TIN/NPI as the MIPS payment adjustment identifier. They are concerned that TIN/NPI promotes individual achievement and undercuts a practice's ability to incentivize quality improvement behaviors through group or teamwork. Other commenters noted the administrative burden for group practices because they would have to track multiple MIPS payment adjustments within their TIN. They recommended applying the MIPS payment adjustment uniformly for each TIN.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We want the MIPS to encourage teamwork and coordination. We have finalized measurement at the group level (TIN) and the APM entity level to help encourage that goal. Generally, all TIN/NPIs that are measured as a group or an APM entity will have the same final score, and therefore have the same MIPS payment adjustment. We believe it would be challenging to apply the MIPS payment adjustment uniformly at the TIN level, because as noted earlier, we need to account for individuals who are excluded from MIPS and to resolve scenarios where there are overlapping or duplicative final scores. For MIPS eligible clinicians that report as a group, the low-volume threshold will be determined based on the group as a whole – in this case, the low volume threshold would be determined based on considering the volume across all NPIs billing within that TIN regardless of MIPS eligibility. Other exclusions, however, such as newly enrolled and QP, are applied at the NPI level. Therefore, some NPIs within a TIN may be excluded from MIPS individual reporting requirements and payment adjustments; however, if the TIN chooses to participate in MIPS as a group, data for those NPIs would be included when determining the group's performance. We refer readers to section II.E.3 of this final rule with comment period for the list of MIPS statutory exclusions. In response to concerns on administrative burden, we intend to work with stakeholders to develop tools to minimize the potential burden of tracking numerous MIPS eligible clinician's payment status.

Comment: One commenter believed that applying the MIPS payment adjustment at the TIN level also closes potential loopholes that would otherwise allow avoidance of payment reductions through switching NPIs. Another commenter expressed significant concerns related to our proposal to use multiple identifiers when assessing participation and performance in MIPS while relying solely on an eligible clinician's TIN/NPI for the purpose of the MIPS payment adjustment under certain circumstances, and requested clarification on how MIPS eligible clinicians would be scored across performance categories when they are a part of a group,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

whether this score is based on individual or group data, and whether the process is consistent across performance categories.

Response: The NPI is meant to be a lasting identifier, and is expected to remain unchanged even if a health care provider changes his or her name, address, provider taxonomy, or other information that was furnished as part of the original NPI application process.

Assignment of a unique NPI to each clinician is managed by the National Plan and Provider Enumeration System (NPPES) which only assigns a single NPI to each individual clinician. We will use the individual NPI, which cannot be changed when the clinician reassigns payment to a different TIN.

Eligible clinicians will be scored across the four performance categories either as an individual or through their group. It is our intent that an eligible clinician reporting through a group will be scored as part of that group for all performance categories, or conversely, that an eligible clinician reporting as an individual will be scored on their individual data for all performance categories.

We would also like to note that all TIN/NPIs participating in a group practice or APM Entity will have the same final score and the same MIPS payment adjustment. The only time the TIN/NPIs will vary across a group practice will be when a TIN/NPI: (1) is excluded from MIPS; (2) has multiple possible final score submissions (for example an APM Entity final score and a TIN final score); or (3) the TIN/NPI is new to a TIN or a TIN is new and therefore does not have historical data associated with the TIN/NPI.

Comment: Several commenters supported the TIN/NPI proposal. Reasons for support included that the TIN/NPI: holds MIPS eligible clinicians accountable for their own performance; could simplify how the MIPS payment adjustment is applied and creates a consistent set of rules. Commenters cautioned, however, that failing to ensure TIN accuracy and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

completeness and having a complicated and inaccessible process for rectifying errors undermines trust in the program.

Response: We agree with commenters that TIN/NPI simplifies how the MIPS payment adjustment is applied. We also note that MIPS eligible clinicians will have an opportunity to request a targeted review of their MIPS payment adjustment factor(s) for a year, which is described in more detail in section II.E.8, and we believe that process to be responsive to the commenters' requests.

After consideration of these comments, we are finalizing our proposal to adopt the TIN/NPI combination as the MIPS payment adjustment identifier.

#### ii. Final Score Used in MIPS Payment Adjustment Calculation

Because we proposed to use only TIN/NPI to apply the MIPS payment adjustments and because there is a gap between the performance period and the MIPS payment year, we believe we should assign the historical final score to each TIN/NPI that is subject to MIPS for the payment year.

In general, we proposed to use the final score associated with the TIN/NPI combination in the performance period. For groups submitting data using the TIN identifier, we proposed to apply the group final score to all the TIN/NPI combinations that bill under that TIN during the performance period. For individual MIPS eligible clinicians submitting data using TIN/NPI, we proposed to use the final score associated with the TIN/NPI that is used during the performance period. For eligible clinicians in MIPS APMs, we proposed to assign the APM Entity group's final score to all the APM Entity Participant Identifiers that are associated with the APM Entity. We refer readers to section II.E.5.h. of this final rule with comment period for more information about the process to identify participating APM Entities. For eligible clinicians that participate in APMs for which the APM scoring standard does not apply, we proposed to assign a final score

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

using either the individual or group data submission assignments described above.

In the case where a MIPS eligible clinician starts working in a new practice or otherwise establishes a new TIN that did not exist during the performance period, there would be no corresponding historical performance information or final score for the new TIN/NPI. Because we want to connect actual performance to the individual MIPS eligible clinician as often as possible, in cases where there is no final score associated with a TIN/NPI from the performance period, we proposed to use the NPI's performance for the TIN(s) the NPI was billing under during the performance period. If the MIPS eligible clinician has only one final score associated with the NPI from the performance period, then we proposed to use that final score. For example, if a MIPS eligible clinician worked in one practice (TIN A) in the performance period, but is working at a new practice (TIN B) during the payment year, then we would use the final score for the old practice (TIN A/NPI) to apply the MIPS payment adjustment for the NPI in the new practice (TIN B/NPI). This proposal most closely linked the MIPS eligible clinician's performance during the performance period to the MIPS payment adjustment. It also ensured that MIPS eligible clinicians that qualify for a positive MIPS payment adjustment are able to keep it, even if they change practices. For those who have a negative MIPS payment adjustment, this proposal also ensured MIPS eligible clinicians are still accountable for their performance.

In scenarios where the MIPS eligible clinician billed under more than one TIN during the performance period, and the MIPS eligible clinician starts working in a new practice or otherwise establishes a new TIN that did not exist during the performance period, we proposed to use a weighted average final score based on total allowed charges associated with the NPI from the performance period. This proposal would provide a final score that is based on all the services the NPI billed to Medicare during the performance period. Table 26 of the proposed rule (81 FR 28272), presents an example of how the weighted average proposed approach would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

work. If an NPI did not have any allowed charges in the performance period, then the clinician would not be included in MIPS due to the low-volume exclusion.

We also proposed an alternative policy where in lieu of taking the weighted average, we take the highest final score from the performance period. We believe the alternative approach rewards MIPS eligible clinicians for their prior performance and may be easier to implement in the transition year of MIPS. Our concern with this approach is that the highest final score may represent a relatively small portion of the MIPS eligible clinician's practice during the performance period.

We requested comment on the proposal to use the final score associated with the TIN(s) the NPI was billing under during the performance period when the TIN/NPI does not have a final score from the performance period. We also requested comment on our proposal to use a weighted average, and the alternative proposal to select the highest final score from the performance period.

We also considered, but did not propose, a policy to have the performance follow the group (TIN) rather than the individual (NPI). In other words, the MIPS eligible clinician's performance would be based on the historical performance of the new TIN that the MIPS eligible clinician moved to after the performance period, even though the MIPS eligible clinician was not part of this group during the performance period. This policy is consistent with the VM and would create incentives for MIPS eligible clinicians to move to higher performing practices (77 FR 69308). We also believe this policy would provide a lower burden for practice administrators as all MIPS eligible clinicians in the TIN would have the same MIPS payment adjustment. On the other hand, having performance follow the TIN creates some challenges. We are concerned that MIPS eligible clinicians who earned a positive MIPS payment adjustment based on their performance during the performance period would not retain the positive MIPS payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustment if the new TIN had a lower final score. Finally, we believe that having performance follow the TIN could create some unanticipated issues with budget neutrality if high-performing TINs expand. For all of these reasons, we did not propose to have performance follow the TIN, but rather have performance follow the NPI; however, we solicited comment on this option.

In some cases, a TIN/NPI could have more than one final score associated with it from the performance period, if the MIPS eligible clinician submitted duplicative data sets. In this situation, the MIPS eligible clinician has not changed practices, rather for example, a MIPS eligible clinician has a final score for an APM Entity and a final score for a group TIN. If a MIPS eligible clinician has multiple final scores, we proposed a multi-pronged approach to select the final score that would be used to determine the MIPS payment adjustment. First, we proposed that if a MIPS eligible clinician is a participant in MIPS APM, then the APM Entity final score would be used instead of any other final score (such as a group TIN final score or individual final score). We proposed that if a MIPS eligible clinician has more than one APM Entity final score for the same TIN (by participating in multiple MIPS APMs), we would apply the highest APM Entity final score to the MIPS eligible clinician. Second, if a MIPS eligible clinician reports as a group and as an individual, we would calculate a final score for the group and individual identifier and use the highest final score for the TIN/NPI. We requested comment on this proposed approach.

The following is summary of the comments we received regarding our proposals for the final score used in the MIPS payment adjustment calculation.

Comment: Some commenters did not support applying MIPS payment adjustments based on a previous employer's performance or use of prior TIN/NPI combinations if there is no historical information for the current TIN/NPI. Commenters noted it is unfair to base payments on the previous TIN/NPI combinations and supported awarding a neutral score when a MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

eligible clinician comes to a new practice. Commenters also expressed concerns about placing undue burden on the hiring entity and the potential to influence hiring decisions based on data that are 2 years old. Finally, some commenters expressed concerns that a new TIN would be adversely affected by having to accept a negative MIPS payment adjustment for a MIPS eligible clinician that was hired into that TIN after the performance period. These commenters also imply that calculating the MIPS payment adjustment for the individual based on their performance for that corresponding payment year does not recognize that the clinician may learn better compliance at the new practice. Many of these commenters recommended having the NPI inherit the final score of the TIN they moved to after the performance period, if that TIN was an existing TIN during the performance period, even though that NPI was not part of that TIN during that performance period.

Response: In the case where a MIPS eligible clinician starts working in a new practice or otherwise bills Medicare under a new TIN, we have no historical performance data for the TIN/NPI. We examined using either the TIN's historical performance or the NPI's historical performance. However, we do not always have a TIN's historical performance. For example, in cases where a TIN elected to have its MIPS eligible clinicians submit individual data, then we would not have a TIN score, only individual scores. In contrast, we would always have NPI historical performance if the TIN/NPI is subject to MIPS. Therefore, we proposed, and will finalize, using the NPI's performance for the TIN(s) the NPI was billing under during the performance period.

We do not believe it would be appropriate to assign a neutral score when performance data for the NPI is available.

In response to concerns that an undue burden would be placed on the hiring entity, we are not asking TINs to perform any of the calculations. We will apply the specific MIPS payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustment that needs to be applied for that specific TIN/NPI for the payment year. We seek feedback on ways to provide the necessary information to practices to minimize burden for them.

In response to concerns about the adverse effect on a new TIN that hires an individual that had a lower final score in the performance period, we want to reiterate that the MIPS payment adjustment is only being applied to that individual TIN/NPI and not all NPIs in that same hiring TIN and that in some cases the MIPS payment adjustment is positive. We believe that our policy tracks accountability to the clinician and will actually encourage all clinicians to seek high performance.

Comment: Some commenters generally supported our proposal that the score follows the clinician to the new practice if there is a change after performance period to a new practice in the payment year, acknowledging that this holds clinicians accountable, but questioned the reasonableness of tracking this for the new receiving practice. One commenter encouraged CMS to consider how to mitigate these problems.

Response: We will work with stakeholders to develop strategies to minimize the burden of tracking adjustments for MIPS eligible clinicians that change practices over time.

Comment: Some commenters supported CMS' proposal to use a weighted final score average of TIN/NPI combinations and apply it to a new TIN/NPI that did not exist during the performance period. One of these commenters stated this was a straightforward approach for handling MIPS eligible clinicians who have changed practice mid-year. Commenters that supported the TIN/NPI combination also supported using the final score associated with each TIN/NPI combination (not weighting across each TIN/NPI) if the clinician was in those TIN/NPIs in the performance period and still in those TINs/NPIs in the payment year. Some commenters supported the approach to use the highest TIN score in instances where a clinician has multiple MIPS scores rather than a weighted average. One commenter supported CMS's

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

alternative approach for eligible clinicians who bill under more than one TIN.

Response: We agree that performance should follow the clinician's NPI. We believe that a weighted average final score would provide a more accurate picture of the NPI's performance. We believe it is easier to communicate and operationalize a methodology that selects the highest final score available for a MIPS eligible clinician, particularly for the transition year. Therefore, we are finalizing our alternative policy to use the highest final score associated with an NPI from the performance period. We may revisit this policy in future rulemaking and consider whether we should require a certain percentage of billings by an NPI under a TIN before attributing the TIN's final score to the NPI.

Comment: One commenter proposed that CMS give eligible clinicians practicing in multiple TINs the option of being scored based on their performance across all TINs and did not recommend that CMS simply calculate a weighted average across all TINs.

Response: We are finalizing the policy that compares scores across all practices and takes the highest final score.

Comment: Some commenters did not support CMS' proposal to calculate a final score for both a group and individual identifier, taking the higher final score, in cases where a MIPS eligible clinician reported as both a group and as an individual. One commenter recommended CMS use a weighted final score average based on total allowed charges associated with the NPI because this approach takes into account the eligible clinician's entire performance during the period. One commenter specifically stated they did not support CMS' proposal to apply the highest APM entity final score to the eligible clinician in cases where a MIPS clinician has more than one APM entity final score for the same TIN.

Response: We are unclear as to how we would calculate a weighted score for the same TIN/NPI during the same performance period. For simplicity, we have elected to take the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

highest final score.

Comment: Another commenter stated the proposed process to determine which final score takes precedence (APM entity, group, or individual) for eligible clinicians is confusing and unnecessarily complicated, as it is currently possible for MIPS eligible clinicians to earn multiple final scores based on their unique reporting experience. The commenter suggested CMS assign only one score to each TIN/NPI.

Response: Each TIN/NPI will receive only one final score for purposes of the MIPS payment adjustment determination. However, since we allow each MIPS eligible clinician to decide how they want to report, either individually, through a group, or through an APM as a MIPS APM participant, we cannot completely control the number of submissions that one TIN/NPI may have. To address these types of circumstances, we have established policies in this section to clearly articulate the hierarchy for which of the final scores will take precedence for the MIPS payment adjustment.

After consideration of these comments, we are finalizing our policy to use the TIN/NPI's historical performance from the performance period associated with the MIPS payment adjustment, regardless of whether that NPI is billing under a new TIN after the performance period. In the event that an NPI bills under multiple TINs in the performance period and bills under a new TIN in the MIPS payment year, we are finalizing our alternative policy of taking the highest final score associated with that NPI in the performance period.

b. MIPS payment adjustment factors

Section 1848(q)(6)(A) of the Act requires the Secretary to specify a MIPS adjustment factor (referred to as a MIPS payment adjustment factor) for each MIPS eligible clinician for a year determined by comparing the final score of the MIPS eligible clinician for such year to the performance threshold established under paragraph (D)(i) for such year, in a manner such that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the adjustment factors specified for a year result in differential payments. Section

1848(q)(6)(A)(iii) of the Act provides that MIPS eligible clinicians with a final score at or above the performance threshold receive a zero or positive MIPS adjustment factor on a linear sliding scale such that a MIPS adjustment factor of 0 percent is assigned for a final score at the performance threshold and a MIPS adjustment factor of the applicable percent is assigned for a final score of 100. Positive MIPS adjustment factors may be increased or decreased by a scaling factor (not to exceed 3.0) to ensure the budget neutrality requirement is met.

Section 1848(q)(6)(A)(iv) of the Act provides that MIPS eligible clinicians with a final score below the performance threshold receive a negative MIPS adjustment factor on a linear sliding scale such that a MIPS adjustment factor of 0 percent is assigned for a final score at the performance threshold and a MIPS adjustment factor of the negative of the applicable percent is assigned for a final score of 0; further, MIPS eligible clinicians with final scores that are equal to or greater than zero, but not greater than one-fourth of the performance threshold, receive a negative MIPS adjustment factor that is equal to the negative of the applicable percent.

Section 1848(q)(6)(B) of the Act defines the applicable percent for each year as follows: (i) for 2019, 4 percent; (ii) for 2020, 5 percent; (iii) for 2021, 7 percent; and (iv) for 2022 and subsequent years, 9 percent.

Section 1848(q)(6)(C) of the Act provides for an additional positive MIPS payment adjustment factor for exceptional performance (referred to as an additional MIPS payment adjustment factor), for each of the years 2019 through 2024, for each MIPS eligible clinician with a final score for a year at or above the additional performance threshold under paragraph (D)(ii) for such year. The additional MIPS payment adjustment factor shall be in the form of a percent and determined in a manner such that MIPS eligible clinicians having higher final scores above the additional performance threshold receive higher additional MIPS payment adjustment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

factors.

We are codifying these requirements as follows:

At §414.1405(a), we are codifying that each MIPS eligible clinician receives a MIPS payment adjustment factor, and if applicable an additional MIPS payment adjustment factor for exceptional performance, for a MIPS payment year determined by comparing their final score to the performance threshold and additional performance threshold for the year.

At §414.1405(b)(1), we are codifying that MIPS eligible clinicians with a final score at or above the performance threshold receive a zero or positive MIPS payment adjustment factor on a linear sliding scale such that an adjustment factor of 0 percent is assigned for a final score at the performance threshold and an adjustment factor of the applicable percent is assigned for a final score of 100.

At §414.1405(b)(2), we are codifying that MIPS eligible clinicians with a final score below the performance threshold receive a negative MIPS payment adjustment factor on a linear sliding scale such that an adjustment factor of 0 percent is assigned for a final score at the performance threshold and an adjustment factor of the negative of the applicable percent is assigned for a final score of 0; further, MIPS eligible clinicians with final scores that are equal to or greater than zero, but not greater than one-fourth of the performance threshold, receive a negative MIPS payment adjustment factor that is equal to the negative of the applicable percent.

At §414.1405(c), we are codifying the applicable percent.

### c. Determining the Performance Thresholds

#### (1) Establishing the Performance Threshold

Under section 1848(q)(6)(D)(i) of the Act, for each year of the MIPS, the Secretary shall compute a performance threshold for which the final scores of MIPS eligible clinicians are compared for purposes of determining the MIPS payment adjustment factors under section

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

1848(q)(6)(A) of the Act for a year. The performance threshold for a year must be either the mean or median (as selected by the Secretary, and which may be reassessed every 3 years) of the final scores for all MIPS eligible clinicians for a prior period specified by the Secretary. Section 1848(q)(6)(D)(iii) of the Act outlines a special rule for the initial 2 years of MIPS, which requires the Secretary, prior to the performance period for such years, to establish a performance threshold for purposes of determining the MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act and an additional performance threshold for purposes of determining the additional MIPS payment adjustment factors under section 1848(q)(6)(C) of the Act, each of which shall be based on a period prior to the performance periods and take into account data available for performance on measures and activities that may be used under the performance categories and other factors determined appropriate by the Secretary.

We are codifying the definition of the term “performance threshold” at §414.1305 as the numerical threshold for a MIPS payment year against which the final scores of MIPS eligible clinicians are compared to determine the MIPS payment adjustment factors. Final scores above the performance threshold receive a positive MIPS payment adjustment factor and final scores below the performance threshold receive a negative MIPS payment adjustment factor. Final scores that are equal to or greater than 0, but not greater than one-fourth of the performance threshold receive the maximum negative MIPS payment adjustment factor for the MIPS payment year. Final scores at the performance threshold receive a neutral MIPS payment adjustment factor.

To establish the performance threshold for the 2019 MIPS payment year, we proposed to model 2014 and 2015 Medicare Part B allowed charges, 2014 and 2015 PQRS data submissions, 2014 and 2015 QRUR and sQRUR feedback data, and 2014 and 2015 Medicare and Medicaid EHR Incentive Program data to inform where the performance threshold should be. We would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

use this data to estimate the impact of the quality and cost scoring proposals. We would also use the EHR Incentive Program information to estimate which MIPS eligible clinicians are likely to receive points for the advancing care information performance category. Because of the lack of historical data for the improvement activities performance category, we would apply some sensitivity analyses to help inform where the performance threshold should be.

For the 2019 MIPS payment year, we proposed to set the performance threshold at a level where approximately half of the eligible clinicians would be below the performance threshold and half would be above the performance threshold, which we believe is consistent with the intent of section 1848(q)(6)(D)(i) of the Act which requires the performance threshold in year 3 and beyond to be equal to the mean or median of final scores from a prior period. We also considered other policy options when setting the performance threshold. For example, we considered setting the performance threshold so that the scaling factor (which is described in section II.E.7.b. of the proposed rule (81 FR 28273) is 1.0. We could set the performance threshold based on policy goals to ensure a minimum number of points are earned before an eligible clinician is able to receive a positive MIPS adjustment factor and potentially an additional adjustment factor for exceptional performance. We solicited comment on the policy options for setting the performance threshold.

The following is summary of the comments we received regarding our proposals for setting the performance threshold for the 2019 MIPS payment year.

Comment: One commenter stated that it is unreasonable to punish nearly half of clinicians in MIPS. Several commenters requested that CMS seek to establish a performance threshold that would ease the transition to MIPS by minimizing penalties under the program. One of those commenters noted that section 1848(q)(6)(D)(iii) of the Act provides the Secretary with a level of discretion in establishing the MIPS performance threshold during the first 2 years

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of the program and requested CMS adopt a threshold methodology for years 1 and 2 that would ease the transition to MIPS by minimizing penalties under the program. Several commenters recommended setting the performance threshold at a modest level for the initial performance year such that it would be readily attainable through data reporting alone (for example, no downward adjustment for those who report measures during the first 2 years). These same commenters suggested that if CMS insists upon setting the performance threshold such that the distribution of penalties and bonuses under MIPS would be expected to be roughly equal, then commenters recommended that CMS adopt the lower-bound estimate of the final score that would be needed to establish such a performance threshold. In other words, CMS should take the lowest possible performance threshold value from the different estimates it generates. According to one commenter, such an approach would be justified because (1) CMS has admitted that it is unclear how MIPS will impact small and solo practices and should therefore go with the threshold that is least likely to have negative impacts, (2) the scaling factor will help ensure budget neutrality in a case where the threshold is set too low, (3) the additional performance threshold will reward true exceptional performance even in cases where the threshold is too low. Other commenters recommended exercising caution in setting the initial performance threshold under MIPS.

One commenter referred to the estimate that half of eligible clinicians would fall below the performance threshold and recommended that CMS create a structure whereby fewer clinicians are penalized during the transition year of the program. Some commenters suggested various approaches to setting the performance threshold lower. One commenter suggests pushing a greater number of physicians into the category where no MIPS payment adjustment is made as one possible solution. Another commenter proposed identifying a threshold range, at least for 2017 performance, to hold clinicians harmless falling in that range. And another commenter

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

suggested to “flatten the curve” of negative MIPS payment adjustments and positive MIPS payment adjustments in the transition year so that more eligible clinicians fall in the middle of the curve and there will be fewer negative MIPS payment adjustments.

Response: We heard significant concern, as summarized above, that MIPS eligible clinicians will not have time to prepare for MIPS, that there is confusion about MIPS, and that the performance threshold should be set low so that the majority of MIPS eligible clinicians are not subject to a negative MIPS payment adjustment. Given the numerous concerns, we agree that year 1 of MIPS should be a transition year, and we have determined that it would be inappropriate to set a performance threshold that would result in downward adjustments to payments for many clinicians who may not have had time to prepare adequately to succeed under the MIPS. By providing a pathway for many clinicians to succeed under MIPS, we believe that we will encourage early participation in the program, which would enable more robust and thorough engagement with the program over time. We agree with the commenters that setting the performance threshold at an appropriately low number will provide MIPS eligible clinicians an opportunity to achieve a minimum level of success under the program, while gaining experience with reporting on the measures and activities and becoming familiar with other program policies and requirements. By contrast, if we set the threshold too high, using a new formula that is unfamiliar and confusing to clinicians, many could be discouraged from participating in the first year of the program, which may lead to lower participation rates in future years. We believe that active participation of MIPS eligible clinicians in MIPS will improve the overall quality, cost, and care coordination of services provided to Medicare beneficiaries.

Section 1848(q)(6)(D)(iii) of the Act includes a special rule to establish the performance threshold and the additional performance threshold for the first 2 years of MIPS. Specifically,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the Secretary shall, prior to the performance period for such years, establish a performance threshold for purposes of determining the MIPS payment adjustment factors under section 1848(q)(6) (A) of the Act and an additional performance threshold for purposes of determining the additional MIPS payment adjustment factors under section 1848(q)(6)(C) of the Act, each of which shall be based on a period prior to the performance periods and take into account data available for performance on measures and activities that may be used under the performance categories and other factors determined appropriate by the Secretary.

We are relying on the special rule under section 1848(q)(6)(D)(iii) of the Act to establish the performance threshold and the additional performance threshold for the 2019 MIPS payment year to create a transition year policy that encourages participation and provides an opportunity for MIPS eligible clinicians to become familiar with MIPS and other aspects of the Quality Payment Program.

We considered available data regarding performance on measures and activities that may be used under the MIPS performance categories. With regard to the quality performance category, we took several steps to identify PQRS participation rates for MIPS eligible clinicians. First, we identified the TIN/NPIs who billed a Medicare Part B service in 2015. We used clinician type and specialty information from NPES to establish a subset of those clinician types who are eligible for MIPS as described in section II.E.1 of this rule. We then used 2015 Part B data to exclude those who did not exceed the low-volume threshold as defined in section II.E.3 of this rule. We used 2015 PQRS data to assess whether to apply the low-volume at the individual (TIN/NPI) or group (TIN) level. We assumed all Shared Savings Program participants would exceed the low volume threshold because the Shared Savings Program has a requirement that the ACOs be attributed a minimum number of patients.

Due to data limitations, we had to proxy new enrollment by identifying NPIs who billed

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

PFS services in 2015 and not in 2014. We also excluded 2015 Pioneer ACO participants and CPC participants as we estimated they might represent QPs in the future. We were not able to specifically identify the exact number of QPs or Partial QPs. We refer readers to the regulatory impact analysis in section V.C. of this final rule with comment period for more details on this analysis. We estimate between 592,119-642,119 MIPS eligible clinicians, but due to the model limitations to identify QP and Partial QPs, we included 676,722 MIPS eligible clinicians in our model.

We used the 2015 PQRS data to create benchmarks for our model based on our final policies and assign points under the quality performance category based on performance. For the readmission measure we used the 2014 VM analytic file, which was the most recent data available. We then estimated final scores using the quality performance category scores. We did not include cost measures because the cost performance category has 0 percent weight in the 2019 final score. We did not include data for improvement activities or advancing care information because we did not have detailed performance data available for all MIPS eligible clinicians. While we have some performance data for the Medicare EHR Incentive Program, we do not have detailed performance data for the Medicaid EHR Incentive Program. Having performance data for only a portion of MIPS eligible clinicians would have skewed the analysis; therefore, we restricted our analysis to the quality performance data only.

Using 2015 PQRS data, we determined which of these MIPS eligible clinicians participated and calculated participation rates for the MIPS quality performance category, the performance category that accounts for a minimum of 60 percent of the transition year final score. For our participation counts, we did not include other data files because 2015 information was either not available or would not have impacted the participation score. We noted that 87.2 percent of the estimated MIPS eligible clinicians submitted data to PQRS, but the participation

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

rate is lower for solo practitioners and practices with 2-9 clinicians at 58.2 percent. As mentioned in this final rule with comment period, we want to create a scenario where many MIPS eligible clinicians have the ability to participate while transitioning to the MIPS.

We are setting the performance threshold at 3 points for the 2019 MIPS payment year taking into account the data available as described above, but also based on other factors we believe are appropriate, such as encouraging participation in the first year of MIPS. We want to ensure that MIPS eligible clinicians are allowed time to gain understanding of the MIPS and pick their pace as they report on the MIPS performance categories. We believe that setting the performance threshold at 3 points will encourage more MIPS eligible clinicians to participate in the MIPS during the transition year and provide a structure for eligible clinicians to gain experience in order to successfully participate in the future years of the MIPS. With a 3 point performance threshold, an eligible clinician could meet or exceed the performance threshold through a minimal level of performance during the transition year. For example, under the quality performance category, the 3-point floor for any submitted quality measure would result in a neutral or positive MIPS payment adjustment for most MIPS eligible clinicians submitting a single measure. A MIPS eligible clinician, including solo practitioner or small practice, that submits one quality measure with low performance, and no improvement activities or measures specified for the advancing care information performance category (assuming advancing care information performance category measures are available and applicable to the MIPS eligible clinician) would have the following performance category scores: the quality performance category score is 3 points out of a possible 60 points (the total possible points is 10 points for each of the six required measures) or 5 percent; improvement activities is 0 points out of a possible 40 points or 0 percent; and advancing care information is 0 percent out of 100 percent. The final score would equal the performance category scores times the performance category

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

weights ( $([5 \text{ percent} * 60 \text{ percent}] + [0 \text{ percent} * 15 \text{ percent}] + [0 \text{ percent} * 25 \text{ percent}]) * 100$ ), which totals 3 points. This MIPS eligible clinician would receive a neutral MIPS payment adjustment because the performance threshold is set at 3 points. Similarly, any MIPS eligible clinician reporting as a group of 16 or more clinicians would receive at least 3.75 points for submitting at least one improvement activity (10 points out of a possible 40 points x 15 percent (improvement activities performance category weight)). Solo practitioner clinicians and those in groups of 15 or less would receive at least 7.5 points (20 points out of a possible 40 points x 15 percent (improvement activities performance category weight)). We provide further details of these calculations in the examples listed at the end of this section. The exception that should be noted is under the advancing care information performance category. For a MIPS eligible clinician to receive a neutral or positive MIPS payment adjustment based solely on the advancing care information performance category, the MIPS eligible clinician must report on all of the measures in the base score, for the reasons discussed in section II.E.5.g.(6)(b) of this final rule with comment period. Finally, we note that if a group of 16 or more, does not report any quality performance category data, the group would be scored on the all-cause readmission measure (assuming the group meets the readmission measure minimum case size requirements) even if they did not submit any other quality performance category measures if they submitted information in other performance categories. If a group of 16 or more did not report any information in any of the performance categories, then the readmission measure would not be scored. A group will never have a final score based on the readmission measure alone.

As commenters note above, the lower performance threshold will “flatten the curve” in that relatively fewer MIPS eligible clinicians would receive a negative MIPS payment adjustment which would lower the scaling factor required by budget neutrality. In other words, the amount of the positive MIPS payment adjustment from the adjustment factor on a per-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinician basis will be less than under our initial proposal as more MIPS eligible clinicians would qualify for a positive MIPS payment adjustment; however, we believe this is necessary in order to achieve our transition year goals.

While we have lowered the performance threshold as part of our transition year policies, we do not think it would be appropriate to lower the additional performance threshold, as the additional performance threshold is the point at which MIPS eligible clinicians can receive an additional adjustment factor for exceptional performance. As we discuss in the next section, we will decouple the performance threshold and the additional performance threshold and set the additional performance threshold at 70 points. The lower performance threshold of 3 points will meet our policy goal to increase participation in the first year of MIPS and transparency in the scoring methodology; however, we believe that MIPS eligible clinicians must demonstrate exceptional performance to receive an additional adjustment factor.

We intend to increase the performance threshold in year 2 and beginning in year 3 we will use the mean or median final score from a prior period as required by section 1848(q)(6)(D)(i) of the Act. The performance threshold and other transition year policies provide an opportunity for MIPS eligible clinicians to pick their pace in participation. This encourages MIPS eligible clinicians to participate and become familiar with the MIPS requirements.

Also, while we are finalizing a performance threshold of 3 and an additional performance threshold of 70 in this rule, in future years we may not publish the numerical performance threshold and additional performance threshold in a final rule. We would finalize our methodology for calculating these thresholds via notice and comment rulemaking and then utilize that methodology to calculate and announce the performance threshold and additional performance threshold for a MIPS payment year on a website prior to the performance period,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

rather than publishing the numerical thresholds within a final rule.

Comment: Several commenters expressed support for our proposal to set the performance threshold as the median of all expected final scores. Another commenter expressed support for CMS' proposal to set the performance threshold for 2019 such that half of eligible clinicians would be below the performance threshold and half would be above it.

Response: As described in this final rule with comment period, we are not finalizing our proposal to set the performance threshold at a level where approximately half of the MIPS eligible clinicians would be below the threshold and half would be above the performance threshold; rather, we are relying on the special rule under section 1848(q)(6)(D)(iii) to set the performance threshold at 3 points for the 2019 MIPS payment year to encourage participation by MIPS eligible clinicians. We will take these commenter's support into consideration as we monitor the MIPS scoring system over time.

Comment: One commenter requested CMS to clarify in the final rule with comment period how the performance thresholds will be set each year. Another commenter questioned the use of the term "approximately" in defining the performance threshold, asking why it would be approximate, rather than precise. One commenter recommended that CMS allow stakeholders to provide input on how the methodology is applied to calculate the 2019 performance threshold, since the description in the proposed rule on the proposed methodology, and alternative methodologies, is not sufficiently detailed. Another commenter is concerned that performance data from 2019 could yield a less equal distribution if CMS chooses to move towards a mean for the performance threshold because if half of MIPS eligible clinicians are above and half are below the performance threshold, this could lead to MIPS eligible clinicians receiving a penalty in 2021 after 2 years of increases, even if their performance did not objectively change. One commenter advised the creation of a policy to mitigate instability in MIPS payment adjustments

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

as the MIPS transitions to its own data. Another commenter expressed concern that CMS' proposal to set the performance threshold at the 50th percentile of national MIPS eligible clinician performance could have disparate impacts on different types of clinicians, particularly those in small practices.

Response: To inform our policies we performed data modeling based on available data. Please see description of our model to assess participation described earlier in this section. We took into account this data to set the additional performance threshold, which we have decoupled from the performance threshold and will set at 70 points. As we noted in this final rule with comment period, for future MIPS payment years, we intend to publish the numerical performance threshold and additional performance threshold on a website prior to the performance period. These thresholds will be specific numbers, not approximations.

Beginning with the third MIPS payment year (2021), we must set the performance threshold according to section 1848(q)(6)(D)(i) of the Act at the mean or median of the final scores for all MIPS eligible clinicians for a prior period.

Comment: Several commenters opposed the use of pre-MACRA data for setting performance thresholds. One commenter did not favor using non-MIPS historical data to set performance thresholds during the first 2 years of MIPS. Another commenter did not support CMS proposal to use existing quality and cost data to set MIPS performance thresholds as this data did not align exactly with MIPS. Another commenter proposed withdrawing the use of 2014 data and using 2016 data in the establishment of the thresholds and noted that using 2016 data will more accurately reflect clinical practice improvements as a result of PQRS. A commenter requested, to the extent that CMS is using 2014 and 2015 PQRS data submissions in setting the initial performance threshold, that CMS exclude data submitted via Measure Groups reporting, which requires only a non-random sample of 20 patients per measure. Additionally,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

one commenter suggested that thresholds should be determined by clinicians and clinician practices in MIPS. Another commenter requested that CMS devise an approach to use 2017 data to set thresholds for both 2017 and 2018 performance periods. One commenter recommended that CMS not rely only on existing data, but to apply lessons learned from previous legacy reporting programs and changes that have been incorporated into MIPS and build those into future performance thresholds.

Response: We disagree with commenters on using prior data from PQRS, VM, and the EHR Incentive program. Section 1848(q)(6)(D)(iii)(II)(aa) of the Act requires us to consider data available with respect to performance on measures and activities that may be used under the performance categories and we believe this data to be the most comparable. As described earlier in this section, we have used data from 2015 PQRS and the 2014 Physician Feedback Program and VM to inform our models, which is the most recent data available. We excluded the PQRS measures group submissions as that option is no longer available in MIPS. In addition, we have used 2015 CMS enrollment files and administrative claims to estimate who is a MIPS eligible clinician.

Comment: One commenter recommended CMS conduct additional analyses assessing the differences in requirements between the preexisting reporting programs and the MIPS performance categories, and use this analysis as the basis for adjusting performance thresholds in the MIPS performance categories.

Response: PQRS, VM, and EHR Incentive Program are different programs than MIPS; however, many of the measures used in the MIPS performance categories are drawn from these programs. In addition, we are unaware of other data sources that would be more appropriate. We have used the source data and tried to replicate the MIPS requirements to create the most informed models possible. For example, we created benchmarks using PQRS data based on the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

finalized MIPS policies. We created group scores for PQRS group practice reporting options and individual scores for individual submissions. The VM and QRUR data from the Physician Feedback Program data is only available at the TIN level, so we applied the group score to individuals when individuals were reporting. While this is not an exact replication of the MIPS methodology, we believe this is a close approximation and we used these data to inform our policies. The performance threshold is set at 3 points to encourage MIPS eligible clinicians to pick their pace as they participate under the Quality Payment Program.

Comment: One commenter requested that CMS clarify how it plans to calculate the MIPS performance threshold for the 2019 payment year by providing detail about the “sensitivity analyses” used to account for the improvement activities performance category. Another commenter recommended that CMS publish this methodology and include a public comment period prior to the start of MIPS.

Response: We elected to not use sensitivity analyses for the creation of the performance threshold. Rather, we used PQRS data to estimate participation and our scoring policies to set the performance threshold at 3 points, and the additional performance threshold at 70 points. As noted above we intend to finalize our methodology for calculating these thresholds for future years via notice and comment rulemaking.

Comment: A commenter disagreed with CMS’s alternative proposal that would require a clinician to earn a minimum number of points above the performance threshold before receiving a positive MIPS adjustment factor, and believed clinicians performing above the established threshold have shown a high level of performance and should be able to immediately begin earning incentives.

Response: We are explaining that our alternative proposal would not have required a MIPS eligible clinician to earn a minimum number of points above the performance threshold to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

achieve a positive MIPS payment adjustment. Rather, we would set the performance threshold where clinicians would be required to meet a certain number of points. As described above, we believe it is important to set transition year policies that encourage participation while allowing the flexibility for MIPS eligible clinicians to pick their pace with the MIPS and other provisions of the Quality Payment Program. Therefore, we are establishing the performance threshold at 3 points.

Comment: A commenter did not believe MIPS eligible clinicians should be rewarded or penalized for scores that do not reflect significant statistical differences from their peers. One commenter stated that given that previous CMS performance analyses were unable to distinguish between large majorities of clinicians, the commenter recommended that performance adjustments be made only the high and low end with clinicians in the middle areas receiving adjustments of a de minimis amount. The commenter understood there were statutory questions involved in this decision by CMS, but the commenter believed that CMS can operate within the text of the statute and employ an adjusted linear structure that recognized the reality that most physicians' performance will be indistinguishable from one another. One commenter suggested incentivizing high-performers and suggested that eligible clinicians under the national performance threshold that improve score by a certain percentage would be eligible to have their penalty decreased by 0.5 percent. Another commenter suggested that CMS apply MIPS payment adjustments based on aggregated MIPS scores that are one standard deviation above (incentive) or one standard deviation below (penalty) the mean or median.

Response: We would like to emphasize that the MIPS payment adjustment a MIPS eligible clinician receives is determined by the final score and how it relates to the performance threshold. Once the linear sliding scale that is described in section II.E.7.b. of this final rule with comment period is established, we will not modify the amount of the MIPS payment adjustment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

based on factors such as improvement or standard deviations. In our scoring policies described in section II.E.6. of this final rule with comment period, we have discussed in detail how we are differentiating performance for the different performance categories and how those performance categories scores are combined into a final score. All MIPS eligible clinicians with the same final score will receive the same MIPS payment adjustment. We also note that with our transition policies that we anticipate most MIPS eligible clinicians that submit data will receive a neutral to small positive MIPS payment adjustment in the transition year. We anticipate the slope of the positive MIPS payment adjustment due to budget neutrality to be relatively flat, which will minimize differences based on the adjustment factor, although there will be more MIPS payment adjustments for the additional adjustment factor for exceptional performance.

Comment: Numerous commenters expressed concern about the negative impact the Quality Payment Program would have on small and rural practices. One commenter recommended that small practices have lower reporting thresholds and adjusted scoring mechanisms throughout the MIPS program. Another commenter recommended that CMS set the performance threshold at 15 points in the transition year of implementation to reduce the negative impact on small practices. One commenter noted that CMS estimates that 87 percent of solo practices will face a negative MIPS payment adjustment in 2019, causing them disproportionate hardship as a result of this system of evaluation.

Response: We recognize the particular challenges faced by small and rural practices. We agree with the commenter that a reduced performance threshold should ease participation burden for small practices, therefore as noted above we are lowering the performance threshold for the transition year to 3 points. We did consider creating different performance criteria for small practices, but determined that these different performance criteria levels would create additional confusion and additional burden for administrators to have to track towards. Rather we believe

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

our approach of modifying the low volume threshold exclusion in combination with the modified performance threshold has created a path for solo and small practices to participate in MIPS. In addition, we will provide additional technical assistance to these practices.

Comment: Several commenters disagreed with the MIPS negative MIPS payment adjustment proposal because they believed it will penalize small practices while subsidizing larger practices. Another commenter requested that small physician practices be exempted from negative MIPS payment adjustments so that they can continue to participate in Medicare. One commenter recommended that CMS reduce the proposed MIPS payment adjustments for 2019, which would result from the 2017 performance period, especially for small practices of 2-9 clinicians. Another commenter hoped there was a reasonable penalty for zero percent compliance for small FFS practices. A few commenters expressed concern that the adjustment factors would exacerbate distortions between well-resourced and less resourced practices. Another commenter requested that CMS take into consideration practice size and location in determining overall MIPS incentives or payment reductions, so that rural clinicians and practices are not penalized at greater levels than urban clinicians and practices. One commenter stated the adverse effects to small and solo practices of the estimated negative MIPS payment adjustments would jeopardize patient care.

Response: We appreciate the commenters concerns and want MIPS to be an equitable program regardless of practice size. We do recognize that many solo and small practices did not participate in the sunseting programs and therefore have less experience with the requirements under the MIPS. To ease the participation burden, we have reduced the performance threshold to 3 points for year 1, which provides a pathway for solo and small practices to engage in MIPS. We do not have the statutory authority to exempt solo practitioners and small practices from MIPS. We have however increased the low-volume exclusion to exclude groups and individuals

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

with less than or equal to \$30,000 in Part B charges or less than or equal to 100 beneficiaries, which will exclude more small groups and solo practices from being MIPS eligible clinicians. Lastly, we note the applicable percent for the MIPS payment adjustments are established in section 1848(q)(6)(B) of the Act and we are not able to modify that amount.

Comment: Several commenters suggested that the scoring system may need special rules for IHS, Tribal, and Urban Indian health programs. These commenters suggested that these clinicians should have their own performance threshold that accounts for the government's responsibility to provide quality health care to AI/ANs and the chronic underfunding of their health care systems.

Response: We appreciate the unique challenges that face MIPS eligible clinicians that are part of IHS, Tribal, and Urban Indian health programs. We considered creating different performance criteria for certain types of clinicians, however, we believe that approach would create more confusion and burden than a cohesive set of criteria. Rather, to ease the participation burden, we have reduced the performance threshold to 3 points for the transition year only, which provides a pathway for MIPS eligible clinicians to engage in MIPS. We are also committed to continuing to work with IHS and its partners to streamline and coordinate programs where possible.

Comment: A few commenters were concerned with the proposed notification of the performance threshold. One commenter was concerned that the threshold for the MIPS final score had not been identified, which would make it difficult for a practice to assess what changes may need to occur. Another commenter was concerned clinicians will not know where they stand relative to the performance threshold on an annual basis until after the close of the reporting period. A commenter proposed that CMS make the MIPS adjustment information available to each eligible clinician at least 2 months prior to when the MIPS payment adjustment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

is applied each year.

Response: We will publish the performance threshold in advance of each performance period. We also intend to provide performance feedback as discussed in section II.E.8.a. of the final rule with comment period to provide eligible clinicians with meaningful information regarding their performance trends. We also intend to develop toolkits and educational materials which will allow MIPS eligible clinicians to estimate their total score and the associated adjustment percentage they could receive.

Comment: Another commenter believed the development of more "real-time" feedback mechanisms would greatly increase the impact of the published performance threshold.

Response: We appreciate the desire for "real-time" feedback and the impact it may have on eligible clinicians' performance. We refer readers to section II.E.8.a. of this final rule with comment period for detailed policies on the performance feedback. . We have also established performance standards so that MIPS eligible clinicians will be able to estimate their performance throughout the performance period.

After consideration of the public comments, we are finalizing at §414.1405(b) that a performance threshold will be specified for each MIPS payment year. Specifically, we are finalizing a performance threshold of 3 points for the 2019 MIPS payment year in accordance with the special rule set forth in section 1848(q)(6)(D)(iii) of the Act. We believe this approach to establishing the performance threshold will enable more robust and thorough engagement with the program over time consistent with our goal for a transition year. As noted above, however, we intend to increase the performance threshold in year 2, and beginning in year 3 we will use the mean or median final score from a prior period as required by section 1848(q)(6)(D)(i) of the Act.

(2) Additional Performance Threshold for Exceptional Performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

In addition to the performance threshold, section 1848(q)(6)(D)(ii) of the Act requires the Secretary to compute, for each year of the MIPS, an additional performance threshold for purposes of determining the additional MIPS payment adjustment factors for exceptional performance under paragraph (C). For each such year, the Secretary shall apply either of the following methods for computing the additional performance threshold: (1) the threshold shall be the score that is equal to the 25th percentile of the range of possible final score above the performance threshold determined under section 1848(q)(6)(D)(i) of the Act; or (2) the threshold shall be the score that is equal to the 25th percentile of the actual final score for MIPS eligible clinicians with final score at or above the performance threshold for the prior period described in section 1848(q)(6)(D)(i) of the Act.

For each year of the MIPS, we will compute an additional performance threshold for purposes of determining the additional MIPS payment adjustment factors under section 1848(q)(6)(C) of the Act. We proposed at §414.1405(e) the following methods for computing the additional performance threshold: the threshold shall be equal to the 25th percentile of the range of possible final score above the performance threshold; or it shall be equal to the 25th percentile of the actual final score for MIPS eligible clinicians with final scores at or above the performance threshold for the prior period used to determine the performance threshold.

As discussed above, section 1848(q)(6)(D)(iii) of the Act outlines a special rule for establishing the additional performance threshold for the initial 2 years of MIPS. Because 2019 is the first MIPS payment year, we do not have any actual final score for MIPS eligible clinicians to use for purposes of defining an additional performance threshold under the methodology proposed above. Therefore, we proposed to establish the additional performance threshold at the 25<sup>th</sup> percentile of the range of possible final scores above the performance threshold. For example, if the performance threshold is 60, then the range of possible final scores above the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance threshold would be 61-100. The 25<sup>th</sup> percentile of those possible values is 70. We intended to publish the additional performance threshold with the performance threshold prior to the performance period.

The following is a summary of the comments we received regarding our proposal to establish the additional performance threshold at the 25<sup>th</sup> percentile of the range of possible final scores above the performance threshold for exceptional performance.

Comment: One commenter expressed support for CMS's proposal to set the additional performance threshold in 2019 at the 25th percentile of the range of possible scores above the performance threshold.

Response: As we discussed in section II.E.7.c.(1) of this final rule with comment period, we are relying on the special rule under section 1848(q)(6)(D)(iii) of the Act to establish the performance threshold at 3 points for the transition year of MIPS (2019 MIPS payment year).

As a result, we are not finalizing our proposal to establish the additional performance threshold at the 25th percentile of the range of possible final scores above the performance threshold.

With a performance threshold set at 3 points, the range of total possible points above the performance threshold is 4 to 100 points. The 25<sup>th</sup> percentile of that range is 27.3 points, which is less than one third of the possible 100 points in the MIPS final score. We do not believe it would be appropriate to lower the additional performance threshold to 27.3 points, as we do not believe a final score of 27.3 points demonstrates exceptional performance by a MIPS eligible clinician. Under section 1848(q)(6)(C) of the Act, a MIPS eligible clinician with a final score at or above the additional performance threshold will receive an additional MIPS payment adjustment factor and may share in the \$500,000,000 available for the year under section 1848(q)(6)(F)(iv) of the Act. We believe these additional incentives should only be available to those clinicians with very high performance on the MIPS measures and activities. Therefore, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

are relying on the special rule under section 1848(q)(6)(D)(iii) of the Act to set the additional performance threshold at 70 points for the transition year (MIPS payment year 2019), which is higher than the 25<sup>th</sup> percentile of the range of the possible final scores above the performance threshold as proposed. We took into account the data available and the modeling described in section II.E.7.c.(1) to estimate final scores based on 2015 PQRS data and used the distribution of quality performance category scores to determine an appropriate additional performance threshold for the transition year (MIPS payment year 2019). In our model using historical 2015 PQRS participation, a final score of 70 points was higher than the mean, but less than the median final score. We believe 70 points is appropriate because it requires a MIPS eligible clinician to submit data for and perform well on more than one performance category (except in the event the advancing care information measures are not applicable and available to a MIPS eligible clinician). Generally, a MIPS eligible clinician could receive a maximum score of 60 points for the quality performance category, which is below the 70-point additional performance threshold. In addition, 70 points is at a high enough level that MIPS eligible clinicians have to submit quality data in order to achieve this target. For example, if a MIPS eligible clinician gets a perfect score for the improvement activities and advancing care information performance categories, but does not submit quality measures data, then the MIPS eligible clinician will only receive 40 points (0 points for quality + 15 points for improvement activities + 25 points for advancing care information), which is below the additional performance threshold. We believe the additional performance threshold at 70 points maintains the incentive for excellent performance while keeping the focus on quality performance.

Comment: One commenter requested clarification on how IHS/Tribally-operated facilities can qualify for an additional positive MIPS payment adjustment for exceptional performance.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: MIPS eligible clinicians that are part of IHS/Tribally-operated facilities are able to earn an additional MIPS payment adjustment factor if their final score is at or above the additional performance threshold of 70 points. These clinicians are subject to the same rules for MIPS participation that apply to other MIPS eligible clinicians.

Comment: One commenter recommended that CMS provide exceptional performance bonuses to MIPS eligible clinicians who demonstrate improvement, not just high achievement, in subsequent performance periods after the first performance period.

Response: We do not have authority to distribute the \$500 million available under section 1848(q)(6)(F)(iv) of the Act for exceptional performance for any reason other than for final scores at or above the additional performance threshold.

After consideration of the public comments, we are codifying at §414.1305 the definition of additional performance threshold as the numerical threshold for a MIPS payment year against which the final scores of MIPS eligible clinicians are compared to determine the additional MIPS payment adjustment factors for exceptional performance. We are also finalizing at §414.1405(d) that an additional performance threshold will be specified for each of the MIPS payment years 2019 through 2024. Specifically, the additional performance threshold for the 2019 MIPS payment year is 70 points.

#### d. Scaling/Budget Neutrality

Section 1848(q)(6)(F)(i) of the Act provides, for positive MIPS payment adjustment factors for MIPS eligible clinicians whose final score is above the performance threshold under paragraph (D)(i) for such year, the Secretary shall increase or decrease such adjustment factors by a scaling factor (not to exceed 3.0) to ensure that the budget neutrality requirement of clause (ii) is met. Stated generally, budget neutrality as required by section 1848(q)(6)(F)(ii) of the Act means the estimated increase in the aggregate allowed charges resulting from the application of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

positive MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act (after application of the scaling factor) is equal to the estimated decrease in the aggregate allowed charges resulting from the application of negative MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act. Under section 1848(q)(6)(F)(iii) of the Act, budget neutrality requirements shall not apply if all MIPS eligible clinicians receive final scores for a year that are below the performance threshold under paragraph (D)(i) for such year, or if the maximum scaling factor (3.0) is applied for a year. We are codifying at §414.1405(b)(3) that a scaling factor not to exceed 3.0 may be applied to positive MIPS payment adjustment factors to ensure budget neutrality such that the estimated increase in aggregate allowed charges resulting from the application of the positive MIPS payment adjustment factors for the MIPS payment year equals the estimated decrease in aggregate allowed charges resulting from the application of negative MIPS payment adjustment factors for the MIPS payment year.

e. Additional Adjustment Factors

Section 1848(q)(6)(C) of the Act requires, for each of the years 2019 through 2024, the Secretary to specify an additional MIPS payment adjustment factor for each MIPS eligible clinician whose final score for a year is at or above the additional performance threshold established under paragraph (D)(ii) for that year. This additional adjustment factor is required to take the form of a percentage and to be determined by the Secretary such that MIPS eligible clinicians with higher final scores above the additional performance threshold receive higher additional MIPS payment adjustment factors. Section 1848(q)(6)(F)(iv)(I) of the Act provides, in specifying the additional adjustment factors under paragraph (C) for each applicable MIPS eligible clinician for a year, the Secretary shall ensure that the estimated aggregate increase in payments under Medicare Part B resulting from the application of such additional adjustment factors shall be equal to \$500,000,000 for each year beginning with 2019 and ending with 2024.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We refer to the \$500,000,000 increase in payments as aggregate incentive payments. Section 1848(q)(6)(F)(iv)(II) of the Act provides that the additional adjustment factor for each applicable MIPS eligible clinician shall not exceed 10 percent, which may result in an aggregate increase in payments that is less than \$500,000,000 as described in subclause (I).

To be consistent with the MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act, we proposed to apply a linear sliding scale where MIPS eligible clinicians with a final score at the additional performance threshold would receive 0.5 percent additional adjustment factor and MIPS eligible clinicians with a final score equal to 100 would receive a 10 percent maximum additional adjustment factor. Similar to the adjustment factor, we would apply a scaling factor that is greater than 0 and less than or equal to 1.0 if needed to ensure distribution of the \$500,000,000 increase in payments. The scaling factor must be greater than 0 to ensure that MIPS eligible clinicians with higher final scores receive a higher additional adjustment factor. The scaling factor cannot exceed 1.0; the 10 percent maximum additional adjustment factor could only decrease and not increase because section 1848(q)(6)(F)(iv)(II) of the Act provides that the additional adjustment factor shall not exceed 10 percent. We proposed the starting point for the additional adjustment factor at 0.5 percent for a final score at the additional performance threshold because this would provide a large enough incentive for MIPS eligible clinicians to strive for the additional performance threshold, while still providing the opportunity for a positive slope on the linear sliding scale. If we are unable to achieve a linear sliding scale starting at 0.5 percent (because the estimated aggregate increase in payments for a year would exceed \$500 million), then we proposed to lower the starting percentage for a final score at the additional performance threshold until we are able to create the linear sliding scale with a scaling factor greater than 0 and less than or equal to 1.0. A MIPS eligible clinician with a final score that is below the additional performance threshold would not be eligible for an additional

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustment factor. We requested comments on these proposals.

The following is summary of the comments we received regarding the additional adjustment factor.

Comment: One commenter expressed support for CMS's proposal to set the starting point for the additional adjustment factor at 0.5 percent; however, a couple commenters did not believe this should be considered a large enough incentive for eligible clinicians to strive to reach the additional threshold, particularly for physicians without a significant amount of Medicare business. One of the commenters requested an explanation for why CMS would use a 0.5 percent adjustment factor for MIPS clinicians above the additional performance threshold.

Response: We would like to note that the additional adjustment factor could range from 0.5 percent up to 10 percent, depending on the scaling factor. As the final score increases, the additional adjustment factor increases. We started at 0.5 percent as that is the annual update for the PFS for 2019 and we believed this was a reasonable starting point that would allow a positive slope for the additional adjustment factor.

Comment: One commenter was concerned with funding bonuses for the Quality Payment Program given that the program needs to be budget neutral.

Response: Under section 1848(q)(6)(F) of the Act, budget neutrality is only required with respect to the MIPS payment adjustment factors under section 1848(q)(6)(A), not the additional MIPS payment adjustment factors for exceptional performance under section 1848(q)(6)(C) of the Act.

After consideration of the public comments, we are finalizing our proposal at §414.1405(d)(1), MIPS eligible clinicians with a final score at or above the additional performance threshold receive an additional MIPS payment adjustment factor for exceptional performance on a linear sliding scale such that an additional adjustment factor of 0.5 percent is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assigned for a final score at the additional performance threshold and an additional adjustment factor of 10 percent is assigned for a final score of 100, subject to the application of a scaling factor as determined by CMS, such that the estimated aggregate increase in payments resulting from the application of the additional MIPS payment adjustment factors for the MIPS payment year shall not exceed \$500,000,000 for each of the MIPS payment years 2019 through 2024.

f. Application of the MIPS payment adjustment factors

Section 1848(q)(6)(E) of the Act provides that for items and services furnished by a MIPS eligible clinician during a year (beginning with 2019), the amount otherwise paid under Part B for such items and services and MIPS eligible clinician for such year, shall be multiplied by 1 plus the sum of the MIPS payment adjustment factor determined under section 1848(q)(6)(A) of the Act divided by 100, and as applicable, the additional MIPS payment adjustment factor determined under section 1848(q)(6)(C) of the Act divided by 100. We would apply the adjustment factors in accordance with section 1848(q)(6)(E) of the Act.

We requested comment on our proposals.

The following is summary of the comments we received regarding our proposal to apply the MIPS payment adjustment factors for items and services furnished by a MIPS eligible clinician during a year in accordance with section 1848(q)(6)(E) of the Act.

Comment: One commenter requested clarification as to how the MIPS payment adjustment will be made, either in a lump sum at the end of the year or reflected in each claim paid. Another commenter suggested the payment be one lump sum.

Response: MIPS payments will not be made in a lump sum, but applied as an adjustment on a per claim basis.

Comment: A few commenters requested further clarification on whether the base rate factored into the MIPS adjustment calculation includes the MIPS adjustment rate.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: The adjustment will be based upon the amount otherwise paid for the item or service under Part B.

Comment: One commenter requested that CMS clarify whether Part B drug payments will be affected by MIPS payment adjustments. Commenter observed that in previous programs (PQRS, EHR Incentive Program (Meaningful Use), and Value-based Payment Modifier) the payment adjustments were only made to the services paid under the Medicare PFS, which included administration of Part B drugs, but not the cost of the actual drugs. Commenter would like verification that this policy will continue under the Quality Payment Program.

Response: We appreciate the comment and note that we did not address this issue in the proposed rule. We will consider this issue and intend to provide clarification in the future.

Comment: Commenter requested guidance on whether Medicare Advantage plans would build in MIPS adjustments to their payment rates to non-contracted providers, as MA plans are currently required to pay non-contracted providers the same rates as they receive under FFS. Commenter stated that if adjustments must be factored in to non-contracted provider payment rates, it will be critical for CMS to provide plans with timely and complete data on adjustments to ensure payment accuracy.

Response: Medicare Advantage rates are set through a separate process, and payment policies will be addressed in the Advance Notice and Rate Announcement for that program.

After consideration of the public comments, we are finalizing our proposed application of the MIPS payment adjustment factors at §414.1405(e). For each MIPS payment year, the MIPS payment adjustment factor, and if applicable the additional MIPS payment adjustment factor, are applied to Medicare Part B payments for items and services furnished by the MIPS eligible clinician during the year.

g. Example of Adjustment Factors

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Figure A of the proposed rule, provided an example of how various final scores would be converted to an adjustment factor and potentially an additional adjustment factor, using the statutory formula. We direct readers to 81 FR 28276 for an illustration of the proposed policies.

Figure A in this final rule with comment period shows an illustrative picture based on the final policies. In Figure A, the performance threshold is 3 points. The applicable percentage is 4 percent for 2019. The adjustment factor is determined on a linear sliding scale from zero to 100, with zero being the lowest negative applicable percentage (negative 4 percent for 2019), and 100 being the highest positive applicable percentage. However, there are two modifications to this linear sliding scale. First, there is an exception for a final score between 0 and  $\frac{1}{4}$  of the performance threshold (0 and 0.75 for the 2019 payment year). All MIPS eligible clinicians with a final score in this range would receive the lowest negative applicable percentage (negative 4 percent for 2019). Second, the linear sliding scale line for the positive MIPS adjustment factor is adjusted by the scaling factor (which is determined by the formula described in section II.E.7.d. of this final rule with comment period.). If the scaling factor is greater than 0 and less than or equal to 1.0, then the adjustment factor for a final score of 100 would be less than or equal to 4 percent. If the scaling factor is above 1.0, but less than or equal to 3.0, then the adjustment factor for a final score of 100 would be higher than 4 percent. Only those MIPS eligible clinicians with a final score equal to 3 points (which is the performance threshold in this example) would receive a neutral MIPS payment adjustment. Because our final policies have set the performance threshold at 3 points, we anticipate that the scaling factor would be less than 1.0 and the payment adjustment for MIPS eligible clinicians with a final score of 100 points would be less than 4 percent.

Figure A of this final rule with comment period illustrates an example slope. In this example, the scaling factor for the adjustment factor is 0.214, which is much lower than 1.0.

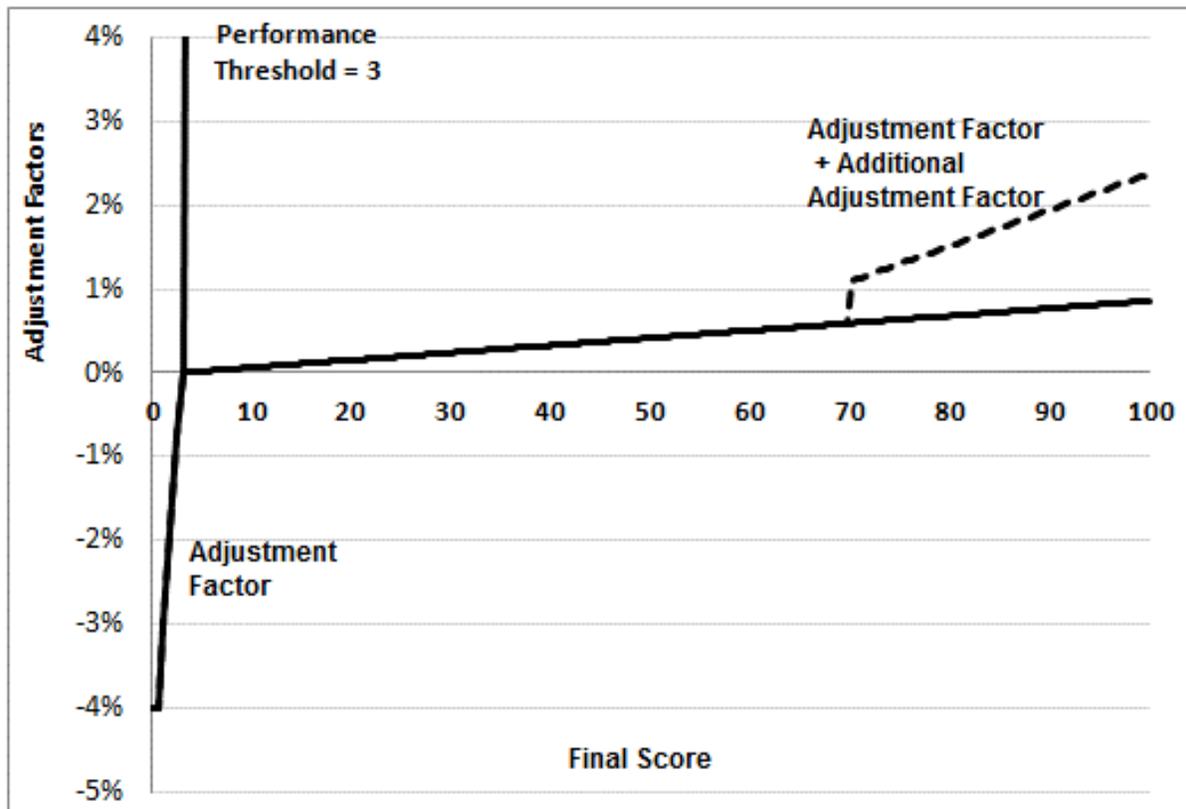

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinicians with a final score equal to 100 would have an adjustment factor of 0.856 percent (4.0 percent x 0.214).

The additional performance threshold is 70 points. An additional adjustment factor of 0.5 percent starts at the additional performance threshold and increases on a linear sliding scale up to 10 percent times a scaling factor that is greater than 0 and less than or equal to 1.0. In Figure A of this final rule with comment period, the example scaling factor for the additional adjustment factor is 0.1523. Therefore, MIPS eligible clinicians with a final score of 100 would have an additional adjustment factor of 1.523 percent (10 percent x 0.1523). The total adjustment for a MIPS eligible clinician with a final score equal to 100 would be  $1 + 0.00856 + 0.01523 = 1.02379$ , for a total positive MIPS payment adjustment of 2.379 percent. Note that in calculating payment adjustments, we will not round any numbers until the final step of the process. After we have calculated the total adjustment for a MIPS eligible clinician, we will round the percentage upward or downward to one decimal point. Thus, a total adjustment of 1.02379 will be rounded to a positive payment adjustment of 2.4 percent.

**FIGURE A: Illustrative Example of MIPS Payment Adjustment Factors Based on Final Scores and Final Performance Threshold and Additional Performance Threshold for the 2019 MIPS Payment Year**

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Note: The adjustment factor for final score values above the performance threshold is illustrative. For MIPS eligible clinicians with a final score of 100, the adjustment factor would be 4 percent times a scaling factor greater than 0 and less than or equal to 3.0. The scaling factor is intended to ensure budget neutrality, but cannot be higher than 3.0. The additional adjustment factor is also illustrative. The additional adjustment factor starts at 0.5 percent and cannot exceed 10 percent. MIPS eligible clinicians at or above the additional performance threshold will receive the amount of the adjustment factor plus the additional adjustment factor.

The final MIPS payment adjustments would be determined by the distribution of final scores across MIPS eligible clinicians and the performance threshold. More MIPS eligible clinicians above the performance threshold means the scaling factors would decrease because more MIPS eligible clinicians receive a positive MIPS payment adjustment. More MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians below the performance threshold means the scaling factors would increase because more MIPS eligible clinicians would have negative MIPS payment adjustments and relatively fewer MIPS eligible clinicians receive positive MIPS payment adjustments.

We requested comment on these examples, but we did not receive any comments on them. We have however provided in Table 31 a summary of the MIPS payment adjustments based on different final scores.

**TABLE 31: Illustration of Point System and Associated Adjustments in Transition Year**

<b>Final Score Points</b>	<b>MIPS Adjustment</b>
0-0.75	Negative 4 percent (Note: We anticipate that this range will comprise mostly of MIPS eligible clinicians with a final score of 0.)
0.76-2.9	Negative MIPS payment adjustment greater than negative 4 percent and less than 0 percent on a linear sliding scale. (Note: We do not anticipate many MIPS eligible clinicians to fall into this range.)
3.0	0 percent adjustment
3.1-69.9	Positive MIPS payment adjustment ranging from greater than 0 percent to 4 percent $\times$ a scaling factor to preserve budget neutrality, on a linear sliding scale
70.0-100	Positive MIPS payment adjustment AND additional MIPS payment adjustment for exceptional performance. (Additional MIPS payment adjustment starting at 0.5 percent and increasing on a linear sliding scale to 10 percent multiplied by a scaling factor.)

We have provided the following examples to demonstrate to readers how the MIPS calculations and performance threshold of 3 points will operate for various performance scenarios.

Example 1: A solo practitioner is a low performer who reports one measure/activity in each performance category. For quality scoring, the MIPS eligible clinician submits 1 quality measure instead of the required 6 measures. Under our finalized scoring approach, we allow all MIPS eligible clinicians to receive a three-point floor per measure in the quality performance category. Under this scenario, the MIPS eligible clinician receives the three-point floor for the one measure submitted and the quality performance category is weighted at 60 percent of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

final score. The MIPS eligible clinician's total quality performance category score is 3: (1 measure x 3 points each /total possible points of 60 points) x 60 = 3. We note that we did not include the all-cause hospital readmissions measure in the above quality performance category calculation since it is not applicable to groups of 15 or fewer clinicians, nor to MIPS eligible clinicians reporting as individuals due to reliability concerns.

As discussed in section II.E.6.a.(4) of this final rule with comment period, different improvement activities scoring rules apply to a solo practitioner (or small group) than apply to groups of 16 or more clinicians. Under these special scoring rules, a solo practitioner who performs one medium-weighted activity receives 20 out of 40 potential points in the improvement activities performance category score, and one who performs one high-weighted activity receives 40 out of 40 of the improvement activities performance category score. The improvement activities performance category score is weighted as 15 percent of the final score. In this example, the MIPS eligible clinician that is a solo practitioner who performs only one medium-weighted activity, which equals 20 out of the 40 possible points, or 50 percent, for the improvement activities performance category score, which has a weight of 15 percent of the final score. The MIPS eligible clinician's total improvement activities performance category score is 7.50 (50 percent x 15 = 7.50).

For advancing care information performance category scoring, the eligible clinician submits the required elements of the base for advancing care information only which is worth 50 percent of the advancing care information performance category score. The advancing care information performance category is worth 25 percent of the final score. In this scenario, the eligible clinician would receive an advancing care information score of (50 percent x 25) = 12.5.

As a result, the total final score = 3 + 7.5 + 12.5 = 23.0 points which is above the performance threshold of 3 points.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Example 2: A MIPS eligible clinician, who is a solo practitioner, receives a 0 for all performance categories except the quality performance category. The MIPS eligible clinician submits four quality measures, instead of the required six measures. Under the finalized scoring approach, we allow all MIPS eligible clinicians to receive a three-point floor per submitted measure in the quality performance category. Under this scenario, the MIPS eligible clinician receives the three-point floor for each of the four measures submitted and the quality performance category is weighted at 60 percent of the final score. Since the MIPS eligible clinician has received 0 in each of the other categories. The MIPS eligible clinician's total final score is: (four measures x 3 points each /total possible points of 60 points) x 60 percent performance category weight = 12 points. The final score = 12 points (12 points for quality + 0 points for improvement activities + 0 points advancing care information) which is above the performance threshold. We note that we did not include the all-cause hospital readmissions measure in the above calculation since it is not applicable to groups 15 or fewer clinicians, nor MIPS eligible clinicians reporting as individuals due to reliability concerns.

Example 3: A MIPS eligible clinician, a high performer who is a solo practitioner, performs two medium-weighted activities in improvement activities and submits five measures with high performance and one measure with slightly above average performance. This clinician does not report in the advancing care information performance category and receives a 0 score for the category. For quality scoring, under this scenario, we assume for purposes of illustration and ease of understanding that the MIPS eligible clinician receives 10 points for each of the measures submitted with high performance, and 6 points for the other measure submitted. The quality performance category is weighted at 60 percent of the final score. The MIPS eligible clinician's quality score is: (five measures x 10 points each + 1 measure x 6 points each / total possible points of 60 points) x 60 = 56 points. We note that we did not include the all-cause

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

hospital readmissions measure in the above calculation since it is not applicable to groups with 15 or fewer clinicians and MIPS eligible clinicians reporting as individuals due to reliability concerns.

As discussed in section II.E.6.a.(4) of this final rule with comment period, different improvement activities scoring rules apply to a solo practitioner (or small group) than apply to groups of 16 or more clinicians. Under these special scoring rules, a solo practitioner who performs one medium-weighted activity receives 20 out of 40 potential points in the improvement activities performance category score, and one who performs one high-weighted activity receives 40 out of 40 of the improvement activities performance category score. The improvement activities performance category score is weighted as 15 percent of the final score. In this example, the MIPS eligible clinician performs two medium-weighted activities, which equals 40 out of 40 points or 100 percent for the improvement activities performance category score, which has a weight of 15 percent of the final score. The MIPS eligible clinician's total improvement activities performance category score is 15 ( $40/40 \times 15=15$ ).

Under this scenario, the MIPS eligible clinician's final score is 56 for the quality performance category score +15 for the improvement activities performance category score + 0 for advancing care information performance category score = 71 points which is above the additional performance threshold of 70.

Example 4: A MIPS eligible clinician in a group with 20 MIPS eligible clinicians, reports as a group, and only submits data for the improvement activities performance category. This group also has sufficient case volume to be measured for the readmission measure and in our hypothetical example, has poor performance and receives 3 points for the readmission measure. In this scenario, the improvement activities special scoring rules do not apply since the MIPS eligible clinician is in a group of 20 MIPS eligible clinicians and is reporting as a group. The

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinician performs only one high activity for the improvement activities performance category. For improvement activities scoring for groups of more than 15 clinicians, all groups who perform one medium activity receive 10 out of 40 points for the improvement activities score, and those who perform each high activity receive 20 points toward the improvement activities score. The improvement activities score is weighted as 15 percent of the final score. In this example, the MIPS eligible clinician performs only one high activity, achieves 20 out of 40 possible points of the improvement activities score, which has a weight of 15 percent of the final score. In addition, even though the group did not submit quality measures to the quality performance category information, the group is measured on the readmission measure because the group has submitted improvement activities as a group. As explained above, the group achieves only 3 points on the readmission measure and therefore has a quality score equal to 3 out 70 points. The group has 0 for the advancing care information category. The eligible clinician's total final score is  $(3/70 \text{ quality performance category score} \times 60 \text{ percent for quality performance category weight}) + (20/40 \text{ improvement activities performance category score} \times 15 \text{ percent improvement activities performance category weight}) + (0 \text{ advancing care information quality score} \times 25 \text{ percent advancing care information performance category weight}) = [(4.3 \text{ percent} \times 60 \text{ percent}) + (50 \text{ percent} \times 15 \text{ percent}) + (0 \text{ percent} \times 25 \text{ percent})] \times 100 = 10.1$  points, which is above the performance threshold of 3.

We cannot guarantee that establishing the performance threshold of 3 for the transition year will always provide a positive MIPS payment adjustment for MIPS eligible clinicians; however, it does provide more opportunities for MIPS eligible clinicians to participate and become familiar with MIPS. In addition, the additional adjustment factor provides incentives for MIPS eligible clinicians to strive for good performance.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

## 8. Review and Correction of MIPS Final Score

### a. Feedback and Information to Improve Performance

Through the MIPS and APMs RFI, we solicited comment on various questions related to performance feedback under section 1848(q)(12) of the Act, such as what type of information should be contained in the performance feedback data, how often the feedback should be made available, and who should be able to access the data. Several commenters stated that it would be beneficial if the performance feedback under MIPS contained all the data that contributes to an EP's final score and any MIPS adjustment. Further, several commenters suggested that performance feedback allow for interactive use of the data. Commenters supported frequent availability of such data and many noted that a minimum of quarterly feedback data would be preferred. Commenters also noted that access to PQRS feedback reports currently was a challenge and some suggested that the EPs should be able to control who can access the feedback reports.

#### (1) Performance Feedback

##### (a) MIPS Eligible Clinicians

Under section 1848(q)(12)(A)(i) of the Act, as added by section 101(c)(1) of the MACRA, we are at a minimum required to provide MIPS eligible clinicians with timely (such as quarterly) confidential feedback on their performance under the quality and cost performance categories beginning July 1, 2017, and we have discretion to provide such feedback regarding the improvement activities and advancing care information performance categories.

Beginning July 1, 2017, we proposed to include information on the quality and cost performance categories in the performance feedback. Within these performance categories, we proposed to use fields similar (that is, quality and cost) to those currently available in the Quality and Resource Use Reports (QRURs). Since the QRURs already provide information on quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

and cost we believe this is a good starting point for the data fields to be included in the

performance feedback. Additional information on the current QRURs can be found

at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service->

[Payment/PhysicianFeedbackProgram/2015-QRUR.html](https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeedbackProgram/2015-QRUR.html).

The first performance feedback is due on July 1, 2017. As this is prior to us having received any MIPS data, we proposed to initially provide feedback to MIPS eligible clinicians who are participating in MIPS using historical data set(s), as available and applicable. For example, these historical data set(s) could be a baseline report, using data based off performance that occurred in CY 2015 or CY 2016 for applicable and available quality and cost data. Since 2017 is the first MIPS performance period (as finalized in section II.E.8.a.), we do not anticipate receiving the first set of data for MIPS until 2018 (see 81 FR 28181). At a minimum for the transition year, we proposed to provide performance feedback on an annual basis since the first performance feedback, required on July 1, 2017 would be based on historic data set(s). As the program evolves, and we can operationally assess/analyze the MIPS data, we may consider in future years providing performance feedback on a more frequent basis, such as quarterly. Section 1848(q)(12)(A)(i) of the Act requires the performance feedback to be provided “timely” (such as quarterly), which is our goal as MIPS evolves. In addition, we solicited comments on whether we should include first year measures in the performance feedback, meaning new measures that have been in use for less than 1 year, regardless of submission methods. The reasoning behind first-year measures potentially not being reported is we need to review the data from the measures before these data are incorporated into performance feedback, as we want to ensure the data we are providing in the performance feedback is useful and actionable for our stakeholders. We requested comments on these proposals.

In future years and as the program evolves, we intend to seek comment on the template,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

including but not limited to the data fields, for performance feedback. While section 1848(q)(12)(A)(i) of the Act only requires us to provide performance feedback for the quality and cost performance categories, we understand that the improvement activities and advancing care information performance categories are important MIPS data. Commenters to the MIPS and APMs RFI noted that CMS should consult with stakeholders to ensure this performance feedback is useful before these data are provided to MIPS eligible clinicians. Therefore, we may consider including feedback on the performance categories of improvement activities and advancing care information in future years. Further, before we consider adding improvement activities and advancing care information data to the performance feedback we would like to engage in stakeholder outreach to understand what data fields might be helpful and actionable for MIPS eligible clinicians. Regarding the MIPS final score, this is something we are targeting to provide annually as part of the performance feedback as the program evolves. As technically feasible, we are also planning to provide data fields such as the final score and each of the four performance categories in future performance feedback once MIPS data become available. In addition, we plan to explore the possibility of including the MIPS payment adjustment factor (and, as applicable, the additional MIPS payment adjustment factor) in future performance feedback. We solicited comment on the frequency with which this performance feedback should be provided, considerations for including improvement activities and advancing care information, and data fields that should be included in the performance feedback as this program evolves.

The following is a summary of the comments we received regarding our proposal to provide annual performance feedback on the quality and cost performance categories starting July 1, 2017, which would be based on historic/baseline information and include fields similar to QRURs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Some commenters were not in support of providing performance feedback.

However, the majority of commenters supported providing performance feedback. Some commenters agreed with the proposal to provide initial feedback starting on July 1, 2017 based on historical data for the quality and cost performance categories.

With regard to the frequency of providing performance feedback, commenters' suggestions ranged from annually to 6 weeks of the performance period. The majority of commenters stated that annual feedback would not provide timely information or frequent feedback, due to the long look-back periods hindering the ability for improvements of care. Many commenters supported real-time feedback to eligible clinicians and groups, and suggested making feedback available during the performance periods so clinicians could correct errors in a timely fashion. The majority of comments supported quarterly feedback from CMS, some commenters noting this should begin in 2017. One commenter requested that CMS adopt a requirement that eligible clinicians be furnished quarterly feedback on the advancing care information performance category during the performance period.

One commenter stated that 6 months is the ideal target to provide feedback, to allow for unavoidable claim run-out and review processes. While some commenters supported a monthly performance feedback so adjustments could be made in workflow to improve performance. Another commenter noted that performance feedback should be provided no later than 45 days following the end of a performance period. One commenter requested that performance feedback be available and accessible upon request. One commenter recommended that CMS allow eligible clinicians to choose if they want to receive more current feedback, such as quarterly.

Another commenter recommended that performance feedback be provided prior to the end of the performance period. Other commenters suggested that the final performance feedback is provided no later than October 1 of the reporting year. Another commenter expressed that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance feedback to eligible clinicians would only be effective if it would come in time to make meaningful changes to the practice, and that subsequently July 1 was too late in the year for feedback.

Some commenters believed there is value in submitting data more frequently (for example, an iterative process where practices and vendors submit data routinely); but if CMS intends to provide feedback after eligible clinicians submit their data and not on a frequent basis, then eligible clinicians should not be required to submit data more frequently.

Another commenter recommended an approach that allows for timely, actionable feedback, such as the Bundled Payments for Care Improvement (BPCI) model, which offers monthly data files and quarterly reconciliation reports with subsequent true-ups.

Response: As we indicated in the proposed rule, our goal is to provide even more timely feedback under MIPS as the program evolves. We do note that there are a number of challenges with providing feedback more frequently than annually, namely that for the MIPS performance period, under our final policies in this rule data will be received on an annual basis for the majority of submission mechanisms. However, as noted in section II.E.4., we will, if technically feasible, allow for submissions during the performance period. In that section we note that having more frequent data submissions is a preliminary step on being able to issue more timely feedback. We will provide the first performance feedback on the quality and cost performance categories by July 1, 2017. We believe that additional steps need to be taken both internally by CMS and through external stakeholder outreach/engagement to move towards a more frequent data submission process, which will enable CMS to provide more timely or real-time feedback. Additionally, we do not currently have the ability to provide feedback more frequently than annually as data will be submitted to CMS by clinicians and their third party intermediaries on an annual basis. However we will take this comment into future consideration as we develop the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

processes to provide more frequent feedback, including what frequency requirements should be placed around the submission requirements.

Comment: Some commenters requested clarification on whether CMS would provide clinician and/or TIN specific feedback about quality during the reporting year.

Response: We can only provide feedback on performance as often as data are reported to us; for MIPS, this will be an annual basis for all quality submission mechanisms except for claims and administrative claims. As noted in section II.E.4. we will, if technically feasible, allow the submission of data more frequently throughout the year which would allow us to enable the generation of additional feedback that is accurate and meaningful to MIPS eligible clinicians.

Comment: One commenter requested that CMS expand the type of data available to clinicians on the cost performance category. One commenter believed that cost data should be provided to eligible clinicians on a rolling quarterly basis. A few commenters requested more frequent performance feedback for cost, and that cost information be available to clinicians as soon as possible during the performance period, and to keep the attribution process transparent.

One commenter noted that clinicians need real-time information, including attribution for cost to perform well and achieve the Quality Payment Program's goals. One commenter requested that CMS provide attributed cost beneficiary lists and other data to eligible clinicians that can provide timely and actionable insights to organizations on a quarterly basis. Another commenter recommended making available information about cost in local specialists in performance feedback to inform referral decisions which can impact the cost measure performance. Some commenters recommended CMS to provide patient-level claims data for each cost performance measure so clinicians can understand specific care pathways and referral patterns that drive unnecessary expenditures. Another commenter suggested allowing clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to drill down to the un-aggregated patient level for performance feedback for cost.

Some commenters recommended that CMS provide the ability for eligible clinicians and organizations to run real-time cost measure reports on the CMS Web site, as waiting for CMS to publish mid-year or even quarterly reports does not provide sufficient time to design and implement improvement interventions.

One commenter encouraged CMS to provide cost performance feedback that makes it possible for the data to be incorporated into other reporting and analytics tools the clinician might be using and allows the clinician to monitor their scores throughout the reporting period.

Response: We do intend to provide performance feedback on cost measures, as further described in section II.E.5.e. of this final rule with comment period. As technically feasible, we will provide performance feedback on the measures specified for the cost performance category. We also plan to provide feedback on episode-based measures, as we believe this information will be useful to eligible clinicians, even though some of these episode-based measures have not been adopted for the cost performance category for the CY 2017 performance period, but could be used in future years if proposed through rulemaking (see II.E.5.e. of this rule). Additionally, some of these measures will be released in the 2015 S-QRURs that will be available in October 2016. We are still determining the formatting and details of that data. We will publish the cost measures specifications and attribution methodology on our website. We also agree the goal of performance feedback will be to provide as frequently-as-is-meaningful feedback to MIPS eligible clinicians regarding the cost performance category, and this is what we are working toward in the future as we build the web-based application for performance feedback distribution.

Additionally, section 1848(q)(12)(B)(i) of the Act, states that beginning July 1, 2018, the Secretary shall make available to MIPS eligible clinicians information about the items and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

services for which payment is made under Title 18 that are furnished to individuals who are patients of MIPS eligible clinicians by other suppliers and providers of services. This information may be made available through mechanisms determined appropriate by the Secretary. We agree this information would be useful to eligible clinicians, and are therefore targeting to include this information in the performance feedback beginning July 1, 2018.

Comment: One commenter indicated that CMS needs to create performance feedback that shows quality and cost at the measure level and change in performance over time in order for information to be used in performance improvement. Another commenter suggested that CMS provide transparency on quality measurement data at both the individual and group level.

Response: We agree providing performance feedback that shows quality and cost at the measure level would be useful to MIPS eligible clinicians, and we plan to include this data beginning July 1, 2018. As technically feasible we intend to incorporate improvement information into the performance feedback, when available.

Comment: One commenter requested clarification on if the QRUR would still be utilized under MIPS in the same way it is being utilized for PQRS now. Some commenters were concerned about using the QRURs as the template for MIPS performance feedback, expressing their belief that QRURs were not clear in the feedback being provided, actionable on the eligible clinician's behalf, or inclusive of data that would allow the eligible clinician to compare and improve against the performance thresholds. One commenter recommended improvements to the content and accessibility of supplemental QRURs to encourage familiarity with cost performance data and the clinical episodes that will be attributed to a clinician or group. One commenter suggested the QRUR be supplemented with additional information on topics such as beneficiary attribution characteristics. Another commenter requested that CMS encourage clinicians to access performance feedback to supplement the information they receive from CMS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

on their Medicare Fee for Services claims.

One commenter requested that CMS continue to provide timely mid-year and end-of-year QRURs to eligible clinicians in order for them to receive timely feedback about their performance and payment adjustments under MIPS. Some commenters supported quicker and broader access to performance scores and “feedback reports” such as those provided to clinicians as part of the Physician Feedback Program (QRURs), and the Medicare Shared Savings Program for ACOs for quality improvement purposes. One commenter suggested the QRURs be provided on a quarterly basis moving forward with the Quality Payment Program so the information is timely for performance feedback.

One commenter noted concerns with the implementation feasibility of getting performance feedback out for mid-year performance given past experience with the PQRS and QRURs, and urged CMS to make the investments needed in resources and systems to ensure timely feedback.

Response: Under section 1848(n)(11) of the Act, as added by section 101(d)(3) of the MACRA, reports under the Physician Feedback Program (in other words, the QRURs) shall not be provided after December 31, 2017, and will be succeeded by the MIPS performance feedback under section 1848(q)(12) of the Act. The QRURs have provided information on quality and cost measure performance as well as the beneficiary and clinician-level data underlying and driving the measures; therefore, while we believe this is a good starting point for performance feedback under the MIPS, we do not anticipate using the same format as the QRURs for future years of the Quality Payment Program. We will continue to engage in user research with front-line clinicians and other stakeholders to ensure we are providing the performance feedback data in a user-friendly format, and that we are including the data most relevant to clinicians.

Comment: Many commenters suggested feedback be included on all four performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

categories, so eligible clinicians could know how they are doing in each performance category.

Some commenters recommended that CMS use its discretion to expand the performance feedback to relay information on improvement activities and advancing care information.

Response: We agree that all four performance categories may be beneficial to include in performance feedback. For the first performance feedback, as we proposed, only quality and cost will be provided. We will continue to work with stakeholders on the best way to include all four performance categories in performance feedback. A summary of comments received regarding future considerations for including improvement activities and advancing care information, and data fields that should be included in the performance feedback as this program evolves can be found below in section II.E.8.a.(7) of this final rule with comment period.

Comment: One commenter expressed support for providing more frequent real-time feedback to eligible clinicians on administrative claims-based measures. Another commenter believed that CMS should make claim-level data for all potential beneficiaries available to practices with MIPS eligible clinicians.

Response: We will be providing performance feedback on these types of measures, as applicable. We also agree the goal of performance feedback will be to provide as frequently-as-is-meaningful feedback to clinicians, and this is what we are working toward in the future as we build the web-based application and work with registries, EHRs, and QCDRs for performance feedback.

Comment: One commenter believed that CMS does not need to create a new feedback reporting system, but should instead focus on improving the current system.

Response: We agree, and will continue working with stakeholders to improve the future performance feedback for the Quality Payment Program.

Comment: Some commenters requested that eligible clinicians who are not required, but

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

who report voluntarily, receive the same access to performance feedback as MIPS eligible clinicians.

One commenter requested that CMS expedite the performance feedback process so that partial-year data on performance in the transition year of the MIPS is available to physicians prior to July 1, 2018—and preferably prior to January 1, 2018.

Response: We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

After consideration of the comments, we are finalizing that we will use the QRUR released on September 26, 2016 (referred to as the 2015 Annual QRUR) as the first MIPS performance feedback provided under section 1848(q)(12)(A)(i) of the Act, which will contain quality and cost data. The September 2016 QRURs are available and can be accessed at <https://portal.cms.gov/wps/portal/unauthportal/home/>. We encourage physicians and physician groups to access their report and review the quality and cost information to prepare for the Quality Payment Program. To note, this report will not contain data regarding the final score or payment adjustment for the Quality Payment Program, that information is not yet available and therefore will be provided in future performance feedback. Further, we may have MIPS eligible clinicians that will not have historical data available, through the September 2016 QRUR, to produce performance feedback. For those eligible clinicians we will not be able to produce performance feedback, until these eligible clinicians submit data through the Quality Payment Program. Additionally, to note for MIPS eligible clinicians and groups, the Quality Payment Program will produce performance feedback as long as quality data is submitted or at least one patient and is attributed to a MIPS eligible clinician or group for cost or quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measurement.

Lastly, we note that these QRURs are produced at the TIN level, which is the level for applying adjustments under the VM program. We recognize that assessments under MIPS may be conducted at either the individual or group level, and that payment adjustments will be made at the TIN/NPI level; therefore, QRURs may not provide sufficient detail for those clinicians who are currently assessed at the TIN level under the VM, but who may choose to be assessed at the individual level under the Quality Payment Program. To address this issue, we intend, prior to the 2018 performance period, to provide as much feedback as technically possible to clinicians at the individual level. Since at this time CMS will not have performance data for the 2017 performance period (as that data is not yet available), we will not be able to provide feedback on that data. We intend to look into providing feedback to clinicians on the data it does have available, for instance, on claims based cost data or claims based outcome measures.

The September 26, 2016 QRURs show how physician groups and physician solo practitioners performed in 2015 on quality and cost measures relative to national benchmarks and indicate whether physicians will receive an upward, neutral or downward adjustment under the VM in 2017. The QRURs also contain important information about care delivered to Medicare beneficiaries that can be used to better understand and improve quality and cost performance under the VM including information about hospitalizations and other providers that can be used to improve quality and better coordinate care.

By utilizing an already existing report, that provides quality and resource use (for example, cost) feedback, we intend to focus resources on continued user testing with front-line clinicians and other stakeholders and development of new and improved methods and mechanisms for performance feedback, including but not limited to those suggested in these comments. We are utilizing an existing report because it does not make sense for us to create a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

duplicative report containing the same information and provide it to clinicians beginning July 1, 2017, which would only confuse clinicians by continuing to use the same data as provided in the September 26, 2016 QRUR. Additionally, no clinicians would have submitted data for the Quality Payment Program to us before July 1, 2017. Therefore, we intend to invest our resources in creating an easy to understand and meaningful performance feedback for the Quality Payment Program beginning July 1, 2018.

We note, however, that we expect to provide the 2016 annual QRUR in early fall 2017 that will show how groups and solo practitioners performed in 2016 on the quality and cost measures used to calculate the 2018 VM, as well as their 2018 VM payment adjustment. The 2016 annual QRUR will be the last annual QRUR provided to groups and solo practitioners, as the VM program is sunsetting. We believe the 2016 annual QRUR is important to provide ongoing feedback to clinicians and groups to support their successful transition to the Quality Payment Program.

Further we note that in the next performance feedback, we intend to provide performance feedback for MIPS data collected in 2017. This data could potentially include all applicable data reflecting CY 2017 performance, including data on the quality and cost performance categories; as well as, data regarding the final score and payment adjustment. This reflects our commitment to providing as timely information as possible to eligible clinicians in order to help them predict their performance in MIPS. CMS intends for this performance feedback to be available in the new format for the 2017 performance period by summer 2018, after the 2017 reporting closes. For updates and more information, please see [QualityPaymentProgram.cms.gov](http://QualityPaymentProgram.cms.gov).

In addition, we solicited comments on whether we should include first year measures in the performance feedback, meaning new measures that have been in use for less than 1 year, regardless of submission methods. We also solicited comments on including the final score in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance feedback as the program evolves. The following is a summary of the comments we received.

Comment: Some commenters encouraged CMS to provide information on its performance feedback on first year MIPS measures, so that eligible clinicians can determine their performance on these measures before they are scored on them. The commenter stated that whether or not feedback on first year QCDR measures should be reported may have to take into consideration such factors as the number of clinicians reporting on a measure and other concerns, and should be resolved in conjunction with the QCDR sponsor. Another commenter noted that while CMS may be unsure how to analyze first year measures, it is important for CMS to provide as much data as possible in the performance feedback, as long as such data are not shared publically or used to evaluate performance.

Response: We understand the rationale that by providing first year measures in performance feedback, MIPS eligible clinicians may get a better sense of how they are performing on those measures. We need to review the data from the first year measures before these data are incorporated into performance feedback, as we want to ensure the data we are providing in the performance feedback is useful and actionable for our stakeholders. After reviewing data submitted for the first MIPS performance period and working with stakeholders on user experience testing, we will consider including first year measures in the performance feedback.

For detailed information regarding first year measures and public reporting on Physician Compare, we refer commenters to section II.E.10. of this final rule with comment period.

Comment: One commenter believes that CMS should provide feedback every 45 days instead of every 6 months in regard to negative, zero, or positive MIPS payment adjustment status.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: As noted in the proposed rule (81 FR 28277), regarding the MIPS final score, this is something we are targeting to provide annually as part of the performance feedback as the program evolves. As technically feasible, we are also planning to provide data fields such as the final score and each of the four performance categories in future performance feedback once MIPS data becomes available. We note that we have not committed to providing feedback every 6 months, though we are working to increase the frequency of feedback we can provide.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

#### (b) MIPS APM Entities

In the proposed rule, we proposed that MIPS eligible clinicians who participate in MIPS APM Entities would receive performance feedback, as technically feasible (81 FR 28247). A summary of comments on those proposals can be found in section II.E.5.h.(16) of this final rule with comment period.

#### (2) Mechanisms

Under section 1848(q)(12)(A)(ii) of the Act, the Secretary may use one or more mechanisms to make performance feedback available, which may include use of a web-based portal or other mechanisms determined appropriate by the Secretary. For the quality performance category, described in section 1848(q)(2)(A)(i) of the Act, the feedback shall, to the extent an eligible clinician chooses to participate in a data registry for purposes of MIPS (including registries under sections 1848(k) and (m) of the Act), be provided based on performance on quality measures reported through the use of such registries. For any other performance category (that is, cost, improvement activities, or advancing care information), the Secretary shall encourage provision of feedback through qualified clinical data registries (QCDRs) as described in sections 1848(m)(3)(E) of the Act.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We understand that the PQRS and VM programs have employed various communication strategies to notify health care clinicians of the availability of their PQRS feedback reports and QRURs, respectively, through the CMS portal. However, many health care clinicians are still unaware of these reports and/or have difficulty accessing their reports in the portal. Further, we are aware that some health care clinicians perceive the current reports as complex and often difficult to understand; while others find the QRURs, and the drill down data included in them on the Medicare beneficiaries they serve, very useful. We are continuing to work with stakeholders to improve the usability of these reports. As we transition to MIPS, we are committed to ensuring that eligible clinicians are able to access their performance feedback, and that the data are easy to understand while providing information that will help drive quality improvement. We proposed to initially make performance feedback available using a CMS designated system, such as a web-based portal; and if technically feasible perhaps an interactive dashboard. As further discussed in the proposed rule (81 FR 28280), we also proposed to leverage additional mechanisms such as health IT vendors, registries, and QCDRs to help disseminate data/information contained in the performance feedback to eligible clinicians, where applicable. At this time, we believe that these additional mechanisms will only be able to provide information on the quality performance category for MIPS in regard to performance feedback.

We plan to coordinate with third party intermediaries such as health IT vendors and QCDRs as MIPS evolves to enable additional feedback to be sent on the cost, advancing care information and improvement activities performance categories. We solicited comment on this for future rulemaking.

Comments received through the MIPS and APMs RFI noted issues associated with access to the current feedback reports for PQRS. Specifically, comments were received noting issues

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

with Enterprise Identity Management (EIDM) and access to the portal to view PQRS feedback reports. Commenters also noted the need for a mechanism to be put in place to notify EPs when their PQRS feedback report is available. We proposed to use the information contained in the provider or supplier's Medicare enrollment records, and stored in the Provider Enrollment, Chain, and Ownership System (PECOS), as the system of records for eligible clinicians' contact information that should be used when the MIPS performance feedback is available. It is therefore critical that eligible clinicians ensure that their Medicare enrollment records (especially in regard to phone and email contact information) are updated, meaning current, on a consistent basis in PECOS. If more than one email address is listed, then the email address that should be used for communication should be designated. We also intend to provide education and outreach on how to access performance feedback. We solicited comment on additional means that could be used to notify or contact MIPS eligible clinicians and groups when their performance feedback is available.

The following is a summary of the comments we received regarding our proposal to provide performance feedback through a CMS designated system (such as a web-based portal or interactive dashboard), and to leverage additional mechanisms such as health IT vendors, registries, and QCDRs to help disseminate data/information contained in the performance feedback to eligible clinicians, where applicable.

Comment: Commenters stated the feedback should be easy/clear to understand and easy to access, with helpful education and outreach. Some commenters suggested the process to access feedback should be streamlined and less complicated.

Many commenters recommended an interactive web-based dashboard for feedback delivery that provides data in real-time to eligible clinicians, at least on a quarterly basis. Some commenters recommended the display of such a dashboard show performance feedback through

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

graphics. A few commenters recommended to not implement performance feedback for the quality and cost performance categories until CMS has had a chance to bring online a web portal where MIPS eligible clinicians can log in and see their final score. The commenters explained that without understanding how they are scoring versus their peers under MIPS, many may fall inadvertently to the bottom of the quality or cost performance categories.

One commenter recommended that CMS work with health IT vendors to develop a real-time feedback dashboard that can be incorporated into health IT products, such as EHRs, as eligible clinicians will not know where they are relative to the performance threshold on an annual basis until after the close of the performance period. While another commenter recommended that, to the extent it is feasible, CMS consider partnering with registry vendors to integrate reports in registry interfaces, enabling those eligible clinicians reporting via an EHR or QCDR to view performance feedback in a dashboard setting that is familiar to them.

Some commenters suggested that CMS create an electronic interactive tool for eligible clinicians to quickly gauge their progress by calculating scores, which can help eligible clinicians identify measures that are applicable to their practice. Another commenter noted that an important aspect for clinicians and groups in small, rural and underserved areas are intuitive tools to easily calculate their MIPS score, whether this tool is embedded within the health IT vendor, registry, or available on the CMS website. The commenter also stated that this must be a robust tool which would allow clinicians and groups the ability to securely visualize external data such as aggregate claims data used to calculate episode measures.

One commenter recommended performance feedback be available online and in a timely fashion, ideally in the way that the same information would be available to the public, but well in advance of publication. One commenter suggested CMS leverage the My Quality Net Web site to provide performance feedback to clinicians, since hospitals and other clinicians are already

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

accustomed to using it for federal quality reporting programs.

Another commenter recommended that CMS create a clinician portal that will allow eligible clinicians and other clinicians to estimate their payment adjustment.

Some commenters requested that performance feedback provide the ability to drill down for use by individual physicians.

Response: We agree performance feedback should be clear, easy to understand, and provided to eligible clinicians in a user-friendly format (for example, web-based interactive dashboard). In the future, we intend to provide functionality for an interactive experience for performance feedback. As we build the web-based application for performance feedback, we will continue working with stakeholders (for example, as part of usability testing) to ensure the user experience is accounted for when building this system. If technically feasible, we will work toward incorporating a means to drill down by individual clinicians for performance feedback. We will take all of these commenters' recommendations into consideration as we develop performance feedback mechanisms. While we cannot speak to the plans of health IT vendors, registries, or other third party intermediaries; we expect to continue working with them, as well as clinicians, specialty organizations, and other stakeholders to promote continued growth in the availability of timely, easy-to-use performance feedback for clinicians through these mechanisms in complement to the feedback that will be available from CMS. Further, since we have not required advance registration for reporting, we note that participation in MIPS will be at the level at which data is submitted to CMS. Thus, if individual data is submitted, feedback will be on the individual level; if group data is submitted, feedback will be at the group level.

Comment: Some commenters suggested a process be included for physicians to request and implement revisions when performance feedback data are incorrect. Another commenter suggested being allowed to resubmit claims that were incorrectly submitted, as by the time

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

feedback was provided historically in the PQRS and VM programs it was too late and the practice was subject to downward adjustments to payments.

Response: We intend to build in a process for updates/revisions needed for performance feedback, which would be separate from the targeted review process as described in further detail in section II.E.8.c. of this final rule with comment period. We note that as described in section II.E.5. of this rule we do not have the ability to allow for claims to be resubmitted only for the reason of appending a quality data code.

Comment: One commenter recognized that while the goal is to provide quarterly performance feedback, the feedback might not be issued until the first half of a year because historically in the PQRS program most registries do not open or accept data submission until the second quarter of the performance period.

Another commenter agreed with utilizing vendors, such as registries, to communicate performance feedback in real-time so that performance can be monitored at any time. While another commenter recommended that CMS continue to evaluate and work with vendors to determine how health IT vendors and QCDRs can be leveraged to provide more ongoing performance feedback to clinicians, as the goal being an agile method of analyzing performance without manual entry or mistake. One commenter requested that CMS leverage advanced electronic reporting mechanisms to reduce the long feedback turnaround time in claims-based systems and to provide performance data on improvement activities and advancing care information in addition to quality and cost.

One commenter recommended that CMS provide third party intermediaries access to clinician performance feedback for the clinicians for whom they are submitting information for in order to allow third party intermediaries to validate and troubleshoot any issues with the data.

One commenter suggested that CMS allow clinicians to elect to receive their performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

feedback through a Regional Healthcare Innovative Collaborative (RHIC) that are able to provide a multi-payer perspective.

Response: In future years of the program, we plan to leverage additional pathways such as collaborative efforts with health IT vendors, registries, and QCDRs to help disseminate data/information contained in the performance feedback to eligible clinicians, where applicable. We will look to increase feedback to third party intermediaries in the Quality Payment Program; and will continue working with stakeholders as we move toward implementing this functionality. We also direct these commenters to the third party data submission section (II.E.9.) of this final rule with comment period.

Comment: Some commenters suggested individual eligible clinicians should be able to access their performance feedback independently, instead of having to access through a group. One commenter suggested performance feedback also be available to practice administrators (to view all NPIs at the TIN level, as opposed to each individual eligible clinician) and related staff. Some commenters suggested that the performance feedback also be available to practice staff designated by the eligible clinician. Some commenters believed that the EIDM process to access performance feedback should be re-evaluated, noting practices of all sizes (solo and 2+ for eligible clinicians) only should need one EIDM account to view performance feedback, as well as, be allowed to submit data for the practice. Another commenter requested that CMS make the log-in process for accessing performance feedback more user-friendly; as currently it is overly complicated with cumbersome password requirements that reset at short intervals; which limit access to the current PQRS feedback reports and QRURs.

One commenter agreed with offering clinicians the option to receive performance feedback through one channel, and requested that CMS make this a priority for future

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance feedback years. The commenter also recommended that as part of this initiative, CMS work with stakeholders toward creating a channel for eligible clinicians to view their performance on both quality and cost measures across all (or multiple) payers. The commenter also noted that it is critical for eligible clinicians to have access to a resource that provides them with a complete picture of their practice across all payers.

Other commenters stated that many clinicians are unaware of the current QRURs or have had trouble accessing them, noting difficulty with the login process which they believed was being unnecessarily complicated, not always clear who has access, and those that have access are not usually front-line clinicians. The commenter strongly encouraged CMS to push performance feedback out to clinicians as opposed to waiting for clinicians to access the feedback.

Response: We agree the process to access performance feedback should be easy and streamlined. While we have taken steps to streamline the current PQRS feedback reports and QRURs, more could be done. We intend for MIPS eligible clinicians to be able to access their performance feedback independently through a web-based application. Since performance feedback will contain secure data, we recognize the need to balance access with maintaining security. We intend to continue the efforts made under the VM program, to engage physicians and encourage and assist them to access their performance feedback. We will take the comments into account and continue working with stakeholders as we build the CMS designated system for performance feedback.

Comment: One commenter requested that performance feedback data be provided without charge.

Response: As is done currently with the PQRS feedback reports and QRURs, performance feedback will also be provided through a CMS designated system, with no charge to the eligible clinician.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

After consideration of the comments we are finalizing these polices as proposed. In future years of the program, performance feedback will continue to be available through a CMS designated system, which we intend to be a web-based application. The intent is that in the next performance feedback, anticipated to be released around July 1, 2018, this feedback will be the first in the anticipated new dashboard format. It will be provided via the new Quality Payment Program portal and we intend to leverage additional mechanisms such as health IT vendors, registries, and QCDRs to help disseminate data/information contained in the performance feedback to eligible clinicians, where applicable. As we have stated previously, we will continue to engage in user research with front-line clinicians to ensure we are providing the performance feedback data in a user-friendly format, and that we are including the data most relevant to clinicians. For updates and more information, please see [QualityPaymentProgram.cms.gov](http://QualityPaymentProgram.cms.gov).

Additionally, we did not receive comments on our proposal to use the information contained in the provider or supplier's Medicare enrollment records, and stored in the Provider Enrollment, Chain, and Ownership System (PECOS), as the system of records for eligible clinicians' contact information that should be used when the MIPS performance feedback is available. Therefore, we are finalizing this policy as proposed.

We also sought comment for future rulemaking on coordinating with third party intermediaries such as health IT vendors and QCDRs as MIPS evolves to enable additional feedback to be sent on the cost, advancing care information and improvement activities performance categories. We did not receive comments on additional feedback that could be sent through third party intermediaries. We plan to work with third party intermediaries as we continue to develop the mechanisms for performance feedback, to see where we may be able to develop and implement efficiencies for the Quality Payment Program. Any regulatory changes would be made through future notice-and-comment rulemaking.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

### (3) Use of Data

Under section 1848(q)(12)(A)(iii) of the Act, for purposes of providing performance feedback, the Secretary may use data, for a MIPS eligible clinician, from periods prior to the current performance period and may use rolling periods in order to make illustrative calculations about the performance of such professional. We believe “illustrative calculations” means an interim, snap shot in time of performance, or perhaps a “dry-run” of the data including measure rates. This would provide an indication of how a MIPS eligible clinician might be performing, but would not be conclusive. Since MIPS will not likely have comparable data until year 3 of the program, these “illustrative calculations” could be based on historical data sets available to CMS until actual data for MIPS is available.

We did not request comments in this section, but did receive a comment which is summarized below.

Comment: One commenter believes that if CMS is able to make “illustrative calculations” in advance of a performance year, then CMS should be able to provide eligible clinicians with performance feedback quarterly in advance of the performance year for all four performance categories.

Response: As we noted in the proposed rule (81 FR 28277-28278), we believe “illustrative calculations” means an interim, snap shot in time of performance, or perhaps a “dry-run” of the data including measure rates, based on historical data available. This would provide an indication of how a MIPS eligible clinician might be performing, but would not be conclusive. Since MIPS will not likely have comparable data until year 3 of the program, these “illustrative calculations” could be based on historical data sets available to us until actual data for MIPS is available. Also, as noted previously in this section of this final rule with comment period the goal is to provide future performance feedback on a quarterly basis, and once

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

technically feasible to include all four performance categories in the performance feedback.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

#### (4) Disclosure Exemption

As stated under section 1848(q)(12)(A)(iv) of the Act, feedback made available under section 1848(q)(12)(A) of the Act shall be exempt from disclosure under 5 U.S.C. 552 (the Freedom of Information Act) (FOIA).

We did not request comments in this section, but we received the following comment:

Comment: One commenter expressed support for the disclosure exemption for MIPS performance feedback under the Freedom of Information Act.

Response: As noted in the proposed rule (81 FR 28278), section 1848(q)(12)(A)(iv) of the Act provides that feedback made available under section 1848(q)(12)(A) of the Act shall be exempt from disclosure under FOIA.

#### (5) Receipt of Information

Section 1848(q)(12)(A)(v) of the Act, states that the Secretary may use the mechanisms established under section 1848(q)(12)(A)(ii) of the Act to receive information from professionals. This allows for expanded use of the feedback mechanism to not only provide feedback on performance to eligible clinicians, but to also receive information from professionals.

We intend to explore the possibility of adding this feature to the CMS designated system, such as a portal, in future years under MIPS. This feature could be a mechanism where MIPS eligible clinicians can send their feedback (that is, if they are experiencing issues accessing their data, technical questions about their data, etc.) to us. We appreciate that MIPS eligible clinicians may have questions regarding the information contained in their performance feedback. To

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assist MIPS eligible clinicians, we intend to establish resources, such as a helpdesk or offer technical assistance, to help address questions with the goal of linking these resource features to the CMS designated system, such as a portal.

Additionally, we solicited comment on the types of information eligible clinicians would like to send to us via this mechanism.

The following is a summary of the comments we received.

Comment: Some commenters recommended a prompt and transparent notification process when errors or inconsistencies are identified on the performance feedback so that errors can be remedied or targeted review requests may occur in a timely manner. Another commenter suggested that a mechanism would be created for eligible clinicians to receive comprehensive periodic feedback or updates from CMS as to how they are performing before each performance period ends.

Other commenters requested that CMS guarantee firm turnaround times for performance feedback, and offer teleconferences to work with eligible clinicians in reviewing the patient data. While some commenters urged CMS to devote the necessary resources, including staff, to help clinicians and administrators interpret the performance feedback (for example, helpdesk).

One commenter recommended that CMS provide technical assistance to eligible clinicians to help understand performance feedback (for example, more practical and specific tips in the help documents for education and outreach, especially as this is a new program).

Response: We appreciate that MIPS eligible clinicians may have questions regarding the information contained in their performance feedback. To assist MIPS eligible clinicians, we intend to establish resources, such as the Quality Payment Program Service Center (for example, helpdesk) or offer technical assistance, to help address questions with the goal of linking these resource features to the CMS designated system, such as a web-based application. We also

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

intend to explore the possibilities of adding a mechanism to receive information from eligible clinicians, to a web-based application. These suggestion will be taken into consideration for the future development of performance feedback.

Comment: Some commenters suggested using the IHS/Tribal/Urban Indian list serve to notify MIPS eligible clinicians and groups when their performance feedback is available.

Response: We agree and will implement this suggestion into the education and outreach planned for performance feedback.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

#### (6) Additional Information – Type of Information

Section 1848(q)(12)(B)(i) of the Act, states that beginning July 1, 2018, the Secretary shall make available to MIPS eligible clinicians information about the items and services for which payment is made under Title 18 that are furnished to individuals who are patients of MIPS eligible clinicians by other suppliers and providers of services. This information may be made available through mechanisms determined appropriate by the Secretary, such as the proposed CMS designated system that would also provide performance feedback. Section 1848(q)(12)(B)(ii) of the Act specifies that the type of information provided may include the name of such providers, the types of items and services furnished, and the dates items and services were furnished. Historical data regarding the total, and components of, allowed charges (and other figures as determined appropriate by the Secretary) may also be provided. We solicited comment on the type of information MIPS eligible clinicians would find useful and the preferred mechanisms to provide such information, as well as, arrangements that should be in place regarding these data (that is, eligible clinicians sharing data). We also solicited comment as to whether additional information regarding beneficiaries attributed to a MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinician under the cost performance category or information about which MIPS eligible clinician(s) beneficiaries to whom a given MIPS eligible clinician provides services were attributed would be useful feedback in regards to quality improvement efforts.

The following is a summary of the comments we received.

Comment: Some commenters suggested performance feedback should include patient-level data in order to aid eligible clinicians to improve quality and cost. One commenter stated it would be easier to provide timely performance feedback to eligible clinicians if smaller statistically relevant sample sizes were reported instead of all Medicare patient data.

Response: As stated above, section 1848(q)(12)(B) of the Act does require patient information to be made available to MIPS eligible clinicians starting July 1, 2018. These suggestions will be taken into consideration as we implement this provision through future rulemaking.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

#### (7) Performance Feedback Template

The performance feedback under section 1848(q)(12)(A) of the Act is meant to be meaningful and usable to eligible clinicians. In an effort to ensure these data are tailored to the needs of eligible clinicians, we solicited comment through the MIPS and APMs RFI and received numerous comments regarding overall format of the performance feedback template. Suggestions were made on what this feedback should include for MIPS. We intend to collaborate with stakeholders outside of notice-and-comment rulemaking on how the performance feedback should look for MIPS; as well as, what data elements would be useful for eligible clinicians.

We solicited comment on the fields that should be included in the performance feedback

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

template for MIPS eligible clinicians. The following is a summary of the comments we received.

Comment: Some commenters supported the idea of a standardized performance feedback template, and encouraged CMS to engage with stakeholders and non-physician practitioners to obtain feedback about the template. One commenter suggested that CMS should consider a number of mechanisms to receive input from stakeholders and provide opportunities to learn about the performance feedback tools in development—for example, the Agency should consider hosting Open Door Forums (ODFs), and ensuring that detailed, comprehensive instructional materials are easily available online. One commenter suggested CMS revisit the MIPS LEAN Design Team materials from the CMS Quality Summit in December 2015. Commenters also suggested that CMS should include clear disclaimers about the limitations of the data.

One commenter suggested that other information could be used in performance feedback by providing data on alternatives to the items or services provided that would have been more cost effective while delivering the same quality of care. Some commenters requested that CMS provide individual eligible clinician and group performance feedback in order to help eligible clinicians determine whether to continue reporting with the group or change to individual reporting.

Another commenter recommended that performance feedback include improved transparency, and additional data points for each reported measure. One commenter recommended that the performance feedback would show both scoring and decile placement for individual eligible clinicians across the areas scored. One commenter believes that all reported measures should be included in performance feedback, and every field that contributed to the score should be included as well. Some commenters suggested performance feedback include data fields that would assist with identification of patients served, costs, outcomes, where and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

what type of care was provided, quality of care for patients, and care coordination activities and needs; and functionality to compare (for example, regionally and nationally) directly against other eligible clinicians. One commenter suggested more relevant non-patient facing specialties be included in performance feedback.

Some commenters suggested performance feedback include the place of service (POS) codes, geography (including state and Medicare locality), health system NPI, the subpart NPI where the services were delivered, and the NPI of the entity receiving assignment for professional services; as well as the ability to include additional identifiers if needed in the future to account for specialties. While another commenter recommended performance feedback include information for suggested areas where the eligible clinician can improve, which promotes quality and helps eligible clinicians avoid penalties. Other commenters recommended that the cause for a penalty be clearly articulated.

Some commenters suggested performance feedback include as much data as possible as long as it is easy to understand, and recommended options for the format of performance feedback. Some commenters recommended a basic report containing the following information: performance threshold to date, where the clinician stands in performance, current possible payment adjustments (with exact reasoning for negative payment adjustment in order to improve for future reporting), and a roadmap to improve performance and avoid a downward adjustment. Some commenters recommended CMS use one comprehensive document for the MIPS performance feedback. Some commenters suggested a second report be included in the performance feedback on a more granular level, and contain MIPS specific components. Commenters also suggested that CMS put certain data in supplemental materials (for example, advancing care information) or appendices so that it does not detract from the main report for performance feedback.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

One commenter suggested that CMS issue an advancing care information experience report similar to the annual PQRS Experience Report with as much information as possible, including reporting experiences by specialty. The commenter noted that CMS could include information on whether each objective was met/not met for the base score; performance data on the objectives being assessed for the performance score; and whether an eligible clinician or group earned bonus points for each measure reported under the Public Health and Clinical Data Registry Reporting objective other than the Immunization Registry Reporting measure. Another commenter recommended that feedback for the advancing care information category include the objectives in which the practice attested for the previous reporting period and the points attributed to those objectives for purposes of calculating the composite score.

A commenter recommended that CMS provide aggregate information by specialty to medical societies, as specialty societies do not have access to QRUR information at the individual clinician level or in aggregate, so they cannot provide meaningful analysis of current cost measures and assistance to clinician members. Another commenter requested that CMS provide additional data to support performance improvement efforts, because while the QRUR provides some ability to drill down into the data, the reports only provide patient-level expenditure data at the aggregate level compared to national benchmarks. While another commenter noted that performance feedback should include sufficient details on what patients and care have been attributed to the clinician and what other clinicians have partnered in that care.

One commenter requested detailed performance feedback highlighting options for improvement activities, discussing incorrect reporting, and include geographical components to allow eligible clinicians to review geographical variations in care processes to acclimate eligible clinicians to this new reporting category. Another commenter recommended that performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

feedback for improvement activities categories be provided as soon as possible, and that the feedback from CMS should confirm that eligible clinicians have met the requirement by using a nationally accredited, certified patient-centered medical home or the degree to which they have met the improvement activities requirement through high- and medium-weighted improvement activities. One commenter believed that for improvement activities performance feedback, CMS could include information on how many and which activities were completed; the method of data submission used to submit improvement activities information; and, in the future, information on improvement relative to prior years. In addition, the commenter suggested that CMS should provide cumulative data about which improvement activities are being reported across MIPS as well as within each specialty designation. Another commenter recommended that electing to receive the performance feedback should also count as an improvement activity.

Some commenters suggested that CMS should make available performance feedback to eligible clinicians on their high-utilization patients in as close to real time as possible or provide practices with reports similar to the Hospital Readmission Reductions Program. Another commenter requested that CMS provide files to clinician practices similar to what are provided to hospitals for the Medicare Spend Per Beneficiary measure that is part of Hospital Value-Based Purchasing.

Some commenters suggested that performance feedback be available via paper reports. Another commenter suggested that performance feedback be provided in an importable form such as a worksheet as opposed to a PDF file, which would allow the eligible clinician more options when reviewing with other tools already in use by the eligible clinician. While other commenters noted performance feedback should be provided in a format that allows eligible clinicians to sort, analyze, and review.

Response: We agree with commenters about continually improving the usability of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance feedback, and will continue doing stakeholder outreach with the goal that the template for performance feedback will be available in a usable and user-friendly format, and different options are considered before the performance feedback is displayed in a web-based application to MIPS eligible clinicians. We will work with stakeholders to consider the best means for providing improvement activities and advancing care information in future performance feedback.

We intend to do as much as we can of the development of the template for performance feedback by working with the stakeholder community in a transparent manner. We think this will both encourage stakeholder commentary and make sure we end up with the best possible format(s) for feedback. CMS intends for this performance feedback to be available in the new format on the 2017 performance period by summer 2018, after the 2017 reporting closes.

We have considered the comments received and will take them into consideration in the future development of performance feedback through separate notice-and-comment rulemaking.

#### b. Announcement of Result of Adjustments

Section 1848(q)(7) of the Act requires that under the MIPS, the Secretary shall, not later than 30 days prior to January 1 of the year involved, make available to MIPS eligible clinicians the MIPS payment adjustment factor (and, as applicable, the additional MIPS payment adjustment factor) applicable to the MIPS eligible clinician for items and services furnished by the professional for such year. The Secretary may include such information in the confidential feedback under section 1848(q)(12) of the Act.

If technically feasible, we proposed to include the MIPS payment adjustment factor and, as applicable, the additional MIPS payment adjustment factor (collectively referred to as the “MIPS payment adjustment factors”) in the performance feedback for eligible clinicians provided under section 1848(q)(12)(A) of the Act. If it is not technically feasible to provide this

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

information in the performance feedback, we proposed to make it available through another mechanism as determined appropriate by the Secretary (such as a portal or a CMS designated Web site) and solicited comment on mechanisms that might be appropriate. The first announcement will be available no later than December 1, 2018 to meet statutory requirements. We requested comment on these proposals.

The following is summary of the comments we received regarding our proposal to include the MIPS payment adjustment factors in the performance feedback, if technically feasible.

Comment: One commenter suggested that performance feedback should include a potential MIPS payment adjustment factor based on current performance or alternatively a tool to run "what if" scenarios regarding the clinician's adjustment.

Response: If technically feasible, we proposed (81 FR 28164) to include the MIPS payment adjustment factors in the performance feedback for eligible clinicians. We appreciate these suggestions, and we will take this into consideration in the development of performance feedback.

Comment: A few commenters expressed concern that 30 days would not be enough time to respond to the announcement of the result of adjustments. One commenter requested a minimum of 90 days instead, while other comments suggested a 120 day notice to allow clinicians the ability to plan financially.

Response: We agree with the commenters and would like to publish this information as early as possible to allow clinicians more time to review and understand the adjustments that will be applied to their payments. We will take this into consideration as we plan for the first announcement, which will be available no later than December 1, 2018 to meet statutory requirements.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter recommended that CMS notify clinicians as soon as feasible regarding payment adjustments to allow practices to prepare for downward adjustments to payments. Commenter recommended that CMS consider providing the adjustment results via letter and through the performance feedback if possible, especially in the beginning years of the program.

Response: As noted in the proposed rule (81 FR 28278), the first announcement will be available no later than December 1, 2018 to meet statutory requirements. We will take these suggestions into consideration as we prepare for the first announcement for the adjustment factors.

After consideration of the comments we are finalizing the policy as proposed that if technically feasible we will include the MIPS payment adjustment factors in the performance feedback. If it is not technically feasible to include the MIPS payment adjustment factors in the performance feedback, we will notify MIPS eligible clinicians through guidance documents or other program communication channels as to when and how this information will be announced prior to the statutory deadline of December 1, 2018. As discussed above, in future years of the program, performance feedback will be available via a CMS designated system, which we intend to be a web-based application. We also anticipate the announcement of the adjustment factors will be available via a web-based application as well. Additionally, please see section II.E.8.c. for final policies for requesting a targeted review.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

### c. Targeted Review

Section 1848(q)(13)(A) of the Act requires the establishment of a process under which a MIPS eligible clinician or group may seek an informal review of the calculation of the MIPS payment adjustment factor (or factors) applicable to such MIPS eligible clinician or group for a year.

We recognize that a principled approach to requesting and conducting a targeted review is required under the MACRA to minimize burdens on MIPS eligible clinicians or groups and ensure transparency under MIPS. We also believe it is important to retain the flexibility to modify MIPS eligible clinicians' or groups' final score or MIPS payment adjustment based on the results of targeted review. This will lend confidence to the determination of the final score and MIPS payment adjustments, as well as, providing finality for the MIPS eligible clinician or group after the targeted review is completed. It will also minimize the need for claims reprocessing. We proposed an approach below that outlines the factors that we would use to determine if a targeted review may be conducted. In keeping with the statutory direction that this process be "informal," we have attempted to minimize the associated burden on the MIPS eligible clinician to the extent possible.

In accordance with section 1848(q)(13)(A) of the Act, we proposed at §414.1385 to adopt a targeted review process under MIPS wherein a MIPS eligible clinician or group may request we review the calculation of the MIPS payment adjustment factor under section 1848(q)(6)(A) of the Act and, as applicable, the calculation of the additional MIPS payment adjustment factor under section 1848(q)(6)(C) of the Act applicable to such MIPS eligible clinician or group for a year. Because this review will be limited to the calculation of the MIPS payment adjustment factor and, as applicable, the additional MIPS payment adjustment factor, we anticipate we may find it necessary to review data related to the measures and activities and the calculation of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

final score according to the defined methodology. The following are examples of circumstances under which a MIPS eligible clinician or group may wish to request a targeted review. This is not a comprehensive list of circumstances:

- The MIPS eligible clinician or group believes that measures or activities submitted to us during the submission period and used in the calculations of the final score and determination of the adjustment factors have calculation errors or data quality issues. These submissions could be with or without the assistance of a third party intermediary; or

- The MIPS eligible clinician or group believes that there are certain errors made by us, such as performance category scores were wrongly assigned to the MIPS eligible clinician or group (for example, the MIPS eligible clinician or group should have been subject to the low-volume threshold exclusion and should not have received a performance category score).

We believe that a fair targeted review request process requires accessibility to all MIPS eligible clinicians or groups within a reasonable period of time and provides electronic and telephonic communication for questions regarding the targeted review process, as well as for the actual request for review and receipt of the decision on that request. The targeted review process will use the same Quality Payment Program Service Center (referred to as the “help desk” in the proposed rule) support mechanism as is provided for MIPS as a whole.

We further proposed at §414.1385 to adopt the following general process for targeted reviews under section 1848(q)(13)(A):

- A MIPS eligible clinician or group electing to request a targeted review may submit their request within 60 days (or a longer period specified by us) after the close of the data submission period. All requests for targeted review must be submitted by July 31 after the close of the data submission period or by a later date that we specify in guidance.

- We will provide a response with our decision on whether or not a targeted review is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

warranted. If a targeted review is warranted, the timeline for completing that review may be dependent on the number of reviews requested (for example, multiple reviews versus a single review by one MIPS eligible clinician or group) and general nature of the review.

- As this process is informal and the statute does not require a formal appeals process, we will not include a hearing process. The MIPS eligible clinician or group may submit additional information to assist in their targeted review at the time of request. If we or our contractors request additional information from the MIPS eligible clinician or group, the supporting information must be received from the MIPS eligible clinician or group by us or our contractors within 10 calendar days of the request. Non-responsiveness to the request for additional information will result in the closure of that targeted review request, although another review request may be submitted if the targeted review submission deadline has not passed.

- Since this is an informal review process and given the limitations on review under section 1848(q)(13)(B) of the Act, decisions based on the targeted review will be final, and there will be no further review or appeal.

If a request for targeted review is approved, the outcome of such review may vary. For example, we may determine that the clinician should have been excluded from MIPS, re-distribute the weights of certain performance categories within the final score (for example, if a performance category should have been weighted at zero), or recalculate a performance category score in accordance with the scoring methodology for the affected category, if technically feasible.

We requested comments on these proposals.

The following is summary of the comments we received regarding our proposals for a targeted review process.

Comment: Several commenters supported the inclusion of a targeted review process for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinicians and groups who believe that CMS has assigned them an incorrect final score or MIPS payment adjustment. Another commenter believed that it is critical that MIPS eligible clinicians have a means to request a review of their MIPS payment adjustment factor. The commenter suggested that CMS put into place a process that is physician friendly and does not automatically assume that the physician is incorrect.

Response: We agree with the commenters that the process should be “physician friendly.” To accomplish this, we have worked to make our process for submitting a targeted review simple and not overly burdensome on the MIPS eligible clinician and groups or their practices. The request for a targeted review will be based on the MIPS eligible clinician’s or group’s MIPS payment adjustment factor(s) for a year. We recommend that MIPS eligible clinicians and groups review this information prior to submitting a request for targeted review. For CMS to perform a full review, supporting documentation from the MIPS eligible clinician or group demonstrating why they believe their MIPS payment adjustment factor(s) is inaccurate is critical.

Comment: A few commenters requested that CMS provide a mechanism where a MIPS eligible clinician or group can contest a negative MIPS payment adjustment if the MIPS eligible clinician believes he or she was inappropriately scored under any given MIPS performance category.

Response: We agree with the commenter and note that for instances where a MIPS eligible clinician believes the underlying data used to calculate a performance category score is inaccurate due to data quality or calculation errors, a targeted review may be requested. MIPS eligible clinicians and groups may submit a request for targeted review if they believe their negative MIPS payment adjustment factor for a year is inaccurate.

Comment: A few commenters requested that CMS establish a meaningful review and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

appeals processes. One commenter noted that the proposed targeted review process does not include a hearing or an opportunity for reconsideration.

Response: We agree and believe the targeted review process we proposed and are finalizing would allow for meaningful review. We note however that section 1848(q)(13)(A) of the Act describes the review process as “targeted” and “informal,” and on that basis, we do not believe a hearing or a second level of review/appeals process is warranted; therefore all decisions under the targeted review process will be final.

Comment: A few commenters proposed that CMS should establish an appeals process through which MIPS eligible clinicians or groups can challenge measures’ applicability if the MIPS eligible clinician or group does not agree that the measures identified by CMS as being applicable to their practice are appropriate.

Response: We intend to provide detailed performance feedback to the MIPS eligible clinicians or groups that will identify which measures were calculated as part of their final score, as well as which measures were calculated for informational purposes only. We do not anticipate that MIPS eligible clinicians or groups would have their final score derived based on measures that were not applicable to them, however in circumstances where, after reviewing the feedback provided, if the MIPS eligible clinician or group believes there is an error made by CMS they may file a targeted review request. We refer the commenter to the performance feedback section at section II.E.8.a. of this final rule with comment period, and the MIPS final score methodology in section II.E.6. of this final rule with comment period for more information related to our final policies.

Comment: One commenter requested an improved targeted review process under MIPS as compared to the current informal review processes under PQRS. The commenter also noted that the communication from CMS notifying clinicians and practices of their payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustments under PQRS has been vague and needs to be customized to each MIPS eligible clinician and group. The commenter recommended that notifications informing MIPS eligible clinicians and groups of a MIPS payment adjustment or low final score should also contain information on the reason for the determination. Another commenter requested that CMS work with stakeholders to identify ways to improve the timeliness of the review process by automating processes, providing additional guidance, and seeking additional resources if necessary.

One commenter stated that clinician experiences with the informal review processes in PQRS and the physician value-based payment modifier have been frustrating. Further, it has been difficult to understand why requests for review were denied. The commenter suggested that CMS create a transparent, effective review process.

Response: We agree with the commenters that to the fullest extent possible the communications to MIPS eligible clinicians or groups should be customized to each MIPS eligible clinician or group wherever possible. We also agree that the targeted review process should be as streamlined and automated as possible. We do note however that all targeted review determinations will be made on a case by case basis, which significantly limits the potential automation of the process. We appreciate the recommendation for improvements to the targeted review process and will take the recommendations into consideration as we further develop the targeted review processes.

Additionally, we regret the frustrations stakeholders have had under the PQRS and VM informal review processes. Under those processes, we provided reasons for our decisions about the requests for informal review we received. Under the MIPS targeted review process, we intend to continue to provide MIPS eligible clinicians or groups with our reasons for granting or denying a request for review, and we will make an effort to provide additional clarifications of our reasons, if needed.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter noted that improvements in Quality Payment Program Service Center support must be made for high quality support. The commenter stated that under PQRS the Help Desk was responsive; however, often times they could not provide comprehensive information as they had limited data available. Commenters also requested that CMS adequately staff the Quality Payment Program Service Center during the review period to respond to questions and direct MIPS eligible clinicians and groups through the process. Another commenter requested providing a mechanism other than calling the Quality Payment Program Service Center to obtain answers to potential targeted review questions in order to reduce the number of targeted reviews that will be filed.

Response: We appreciate requests for improvements to the Quality Payment Program Service Center. We would also like to note that we will continuously review and implement improvements in the future, such as the commenters' recommendations for increases in staffing levels during surge periods such as the targeted review timeframe. In addition to contacting the Quality Payment Program Service Center, we anticipate that the Quality Payment Program website ([QualityPaymentProgram.cms.gov](https://QualityPaymentProgram.cms.gov)) will allow MIPS eligible clinicians or groups to receive additional information concerning their targeted reviews such as the ability to receive status updates. Lastly, in regard to other mechanisms available to obtain additional information, we would encourage the commenter to review all applicable information available on the Quality Payment Program website [QualityPaymentProgram.cms.gov](https://QualityPaymentProgram.cms.gov) (for example, contact information for the Quality Payment Program Service Center, FAQs for targeted review, etc.), as well as join relevant education and outreach meetings, such as the National Provider Calls.

Comment: Several commenters suggested that CMS increase the time period for MIPS eligible clinicians or groups to respond to CMS's or its contractors' requests for additional information. The commenters noted the current 10 calendar day proposal does not account for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the time it takes to process such a request, understand the required actions, and gather requested supporting evidence. Further the commenters noted that it does not provide room for error and would result in a closed targeted review request. Several commenters suggested that CMS give MIPS eligible clinicians or groups at least 60 days to respond to requests if CMS or its contractors request additional information from the MIPS eligible clinician. A few commenters recommended that CMS allow at least 20 business days for submission of additional information. While another commenter requested CMS allow 30 business days to respond to requests for additional information. One commenter requested that exceptions be allowed where this timeline may not be feasible. The commenter acknowledged CMS may not be able to broaden these timelines for the first performance period if CMS implements a later start date, but requested that CMS consider if other program modifications--such as lowering the data submission thresholds, removing certain problematic measures, assessing the number of appeals, and streamlining program requirements--will help reduce the number of delays in processing requests for targeted review.

Response: We note that when we refer to “days,” we generally mean “calendar days” unless otherwise indicated. We appreciate the commenters’ concerns and based on public comments received we will modify this timeframe from 10 days to 30 days. This response timeframe is designed to create open communication between us and the MIPS eligible clinician or group during the targeted review period, while ensuring that we receive all appropriate supporting documentation available to ensure a timely decision can be rendered. We would like to note that this 30 day timeframe for responding to requests for additional information from CMS is not intended for clarifying questions between CMS and the requestor, rather this response timeframe is for requests for additional supporting documentation such as copies of claims, supporting extracts from the MIPS eligible clinicians’ EHR, etc. We also may grant

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

extensions for responding to requests for additional information on a case by case basis if we believe there are extenuating circumstances.

Comment: A few commenters asked for more information to be made available for the targeted review process. The commenters requested a timeframe in which CMS would complete these reviews. One commenter requested clarity on whether these reviews would be completed on a rolling basis, as requests were received, or whether all reviews would take place after the July 31 deadline. The commenters recommended the process for MIPS eligible clinicians or groups to dispute the MIPS final score attributed to them should be straightforward including a point of contact, rubric for reviewing performance, supporting documentation to facilitate reviews, estimated timeframes, and identification of the responsibilities of each party. Further, the commenters stated the burden on MIPS eligible clinicians or groups to collect and present the information needed to dispute a final score should be mitigated. Another commenter also suggested CMS explore multiple strategies for disseminating this information, including FAQs, flowcharts and dedicated Quality Payment Program Service Center personnel.

Response: We appreciate the request for more information. Requests for targeted reviews will be processed on a first come first served basis as requests are received. We agree with the commenters that the process for filing a request for targeted review should be a straightforward process. We intend to publish additional materials such as timelines and toolkits to ease the burden on the targeted review process. Additional information on the targeted review process will be available at [QualityPaymentProgram.cms.gov](https://QualityPaymentProgram.cms.gov).

Comment: One commenter recommended that MIPS eligible clinicians or groups have a formalized mechanism by which they can dispute erroneous information in areas such as reported data for measures, performance scores for MIPS categories, and the final score.

Response: The targeted review process is the mechanism whereby MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians can request a review of their MIPS payment adjustment factor, and as applicable their additional MIPS payment adjustment factor. The MIPS payment adjustment factor is determined based on the final score, which includes the scores for each of the MIPS performance categories. Perceived errors related to the MIPS payment adjustment factor calculations can be addressed in the request for targeted review.

Comment: A few commenters suggested that CMS provide a fair and transparent process for MIPS eligible clinicians or groups to appeal findings in performance feedback. One commenter noted that in general, the power is far greater for CMS to audit and potentially recover money than it is for a MIPS eligible clinician or group to seek an informal review. The commenter believed there should be a more equal power balance between CMS and MIPS eligible clinicians with regard to targeted review.

Response: We refer readers to section II.E.8.a. of this final rule with comment period for information on policies we are finalizing in regard to performance feedback. We believe the relative performance that we provide through performance feedback will provide MIPS eligible clinicians the fair and transparent process and information they need to track performance and to learn about their quality and resource utilization performance. Our goal is to provide stakeholders with a fair and transparent process for requesting a targeted review. The Quality Payment Program website, [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram), will allow MIPS eligible clinicians or groups to get additional information concerning their targeted reviews.

Furthermore, we would like to note that for the MIPS, targeted review, data validation, and audits are separate and distinct processes. Request for targeted reviews are an optional process available to MIPS eligible clinicians and groups, and a request for targeted review has no bearing on the initiation of a data validation and audit request. Lastly, data validation and audit requests do not initiate targeted reviews.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Commenters recommended CMS and its contractors coordinate with third party intermediaries when contacting MIPS eligible clinicians or groups for information under a targeted review. Commenters recommended that CMS continue to allow MIPS eligible clinicians and groups to submit information for informal review without the fear of an additional penalty by CMS or its contractors.

Response: We agree with the commenters that if a MIPS eligible clinician or group uses a third party intermediary for data submission, the third party intermediary should be able to provide any necessary supporting documentation with the consent of the MIPS eligible clinician or group. We also would like to note that MIPS eligible clinicians or groups will not be penalized for filing a request for targeted review. Depending on the findings of the targeted review, it is possible that MIPS eligible clinicians' or groups' final score may be adjusted, which could potentially lead to a modification to their MIPS payment adjustment.

Comment: One commenter requested that CMS clarify that a representative of a group may request a targeted review for the entire group and that reviews do not need to be evaluated at the MIPS eligible clinician or group level since MIPS eligible clinicians reporting under the MIPS group reporting option will have the same final score and adjustment factors.

Response: We agree with the commenter. Authorized representatives of groups may file targeted reviews on behalf of their group members.

Comment: One commenter requested that CMS, through the notice and comment rulemaking process, work with MIPS eligible clinicians or groups to define what other circumstances would merit a targeted review.

Response: In the proposed rule (81 FR 28279), we have provided examples of instances where a MIPS eligible clinician or groups may want to request a targeted review, but as we noted, it was not a comprehensive list of circumstances. We would encourage all MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians or groups who believe a targeted review of their MIPS payment adjustment factor or additional MIPS payment adjustment factor is warranted to submit a request for review.

Comment: A few commenters requested that for the first few years of MIPS the scope of what would be considered an appropriate issue for targeted review should be broadened, and recommended that requests for targeted reviews should be approved for all MIPS eligible clinicians or groups who request them. Another commenter suggested that CMS should not have the ability to deny requests for targeted review.

Response: Section 1848(q)(13)(A) of the Act constrains the scope of the targeted review process to the calculation of the MIPS payment adjustment factor and the additional MIPS payment adjustment factor. We will not broaden the scope of review beyond what is described in the statute. Additionally, we cannot automatically approve targeted review requests, we must review each request to make a decision based on the information received. We may also deny requests for targeted review if the request is duplicative of another request or if the request for targeted review is outside the statutory parameters or limitations mentioned in this rule.

Comment: One commenter recommended that CMS provide MIPS eligible clinicians or groups who request a targeted review and are denied a justification for the denial. The commenter further recommended that there should be a second level of review for requests that are denied, and information regarding the number of reviews requested and the number of reviews that are granted each year should be made public.

Response: If a request for review is denied, we intend to provide a reason for the denial in our communication to the MIPS eligible clinician or group who submitted the request. An example of why a request may be denied is if it is filed after the close of the targeted review period. Section 1848(q)(13)(A) of the Act describes the review process as “targeted” and “informal,” and on that basis, we do not believe a second level of review or an appeals process is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

warranted. Additionally, since this is a targeted review process and given the limitations on review under section 1848(q)(13)(B) of the Act, decisions based on the targeted review will be final, and there will be no further review or appeal.

Additionally, we will continue to review the consideration to publically post information regarding the number of reviews requested and number of reviews that are granted each year.

Comment: One commenter noted that while MIPS eligible clinicians or groups are able to request a targeted review of their MIPS reporting, it is entirely up to CMS's discretion as to whether such a request is granted. The commenter stated that this discretion should not be permitted, especially since, according to the proposed rule, if a MIPS eligible clinician or group is found to have submitted inaccurate data, CMS would reopen, revise, and recoup any resulting overpayment.

Response: Section 1848(q)(13)(A) of the Act constrains the scope of targeted review to the calculation of the MIPS payment adjustment factor and the additional MIPS payment adjustment factor. We will not grant requests for review outside of the scope specified by the statute. As previously mentioned in this section of the final rule with comment, for the MIPS, targeted review, data validation, and audits are separate and distinct processes. We refer readers to section II.E.8.e. and II.E.9.f. of this final rule with comment period for more information regarding data validation and audits and auditing of third party intermediaries submitting MIPS data, respectively.

Comment: One commenter recommended that CMS adjust its appeals process for organizations that serve underserved populations.

Response: We assume that the commenter is referring to the targeted review process and appreciate the recommendation to adjust the targeted review process for organizations that serve underserved populations. We also recognize that many of the MIPS eligible clinicians or groups

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

who service these populations may have limited resources.

Comment: Numerous commenters believe a formal appeals process is needed because an informal review process may not be protective enough to ensure MIPS eligible clinicians and groups have the opportunity to correct misinformation that may adversely impact their Medicare payments. One commenter noted that an appeals process is needed in situations where MIPS eligible clinicians or groups are unfavorably scored at no fault of their own. Another commenter requested that CMS institute a formal appeals process through which MIPS eligible clinicians can submit information to a contractor during a 30-day window. Commenters also recommended an appeals process with two levels of appeal, an expedited informal review and a final reconsideration. Commenters urged CMS to develop automated and streamlined appeals process.

Response: We believe the targeted review process affords MIPS eligible clinicians a sufficient opportunity to identify errors related to the calculation of their MIPS payment adjustment factor. Section 1848(q)(13)(A) of the Act describes the review process as “targeted” and “informal,” and on that basis, we do not believe a second level of review or an appeals process is warranted. Additionally, as noted previously we agree with the commenters that the MIPS targeted review process should be as streamlined and automated as possible. We do note however that all targeted review determinations will be made on a case by case basis, which significantly limits the potential automation of the process. Lastly, in regards to the commenters’ request for two levels of review, while we can appreciate the advantages that a two-level review process provides, we believe that the two-level review process would significantly delay the timing of decisions rendered to MIPS eligible clinicians.

Comment: Several commenters requested clarification on the time period for informal review and receipt of scores. The commenters stated that 60 days is too short to review,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

understand, and test/audit the data. Some commenters noted that within 60 days after the close of the data submission period, most MIPS eligible clinicians will not know if they should request a review until they receive information about what their MIPS payment adjustment will be. Instead, the commenters recommended a minimum of 90 days after the close of the data submission period.

Several commenters proposed that the timeframe to request a targeted review should be based on when the MIPS eligible clinician or group receives performance feedback and MIPS payment adjustment factors from CMS, not 60 days from the close of the data submission period. Another commenter suggested that most MIPS eligible clinicians or groups would prefer to request targeted reviews after performance feedback is released or at the beginning of a MIPS payment adjustment year. The commenter further suggested that CMS develop a timeline for targeted review that anticipates the needs of MIPS eligible clinicians or groups.

A few commenters noted that the 60-day deadline to submit a targeted review request may be inadequate, because MIPS eligible clinicians or groups may not have the data necessary to determine whether a targeted review is needed until performance feedback is received and analyzed. One commenter requested that MIPS eligible clinicians or groups get as much time as needed to submit to the targeted review process.

Several commenters had concerns about the targeted review process timeline and urged CMS to allow for review requests on rolling basis from data submission deadline until a minimum 90 days after performance feedback and MIPS payment adjustment information is provided. Another commenter believed that CMS should allow MIPS eligible clinicians or groups at least 45 days to review its reports before requesting a targeted review. In addition, the commenter stated that CMS should allow test submissions in order for MIPS eligible clinicians or groups and third party intermediaries to identify any issues prior to final submission.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: Based on numerous commenters' feedback we are modifying our proposed July 31<sup>st</sup> deadline for submission of a targeted review request. We are finalizing a 60-day period to submit a request for targeted review, which begins on the day CMS makes available the MIPS payment adjustment factor, and if applicable the additional MIPS payment adjustment factor, for the MIPS payment year and ends on September 30 of the year prior to the MIPS payment year or a later date specified by CMS. We agree with the commenters that prior to submitting a request for targeted review, MIPS eligible clinicians should have the opportunity to review their MIPS payment adjustment factor(s), their performance feedback, and make an informed decision about whether they want to request a targeted review. As noted prior, we intend to publish additional information such as timelines and toolkits on the targeted review process at [QualityPaymentProgram.cms.gov](http://QualityPaymentProgram.cms.gov).

In regards to the request to allow for "test submissions," as noted in section II.E.9. of this final rule with comment period, we intend to provide testing tools prior to the beginning of the submission process to reduce any data errors associated with data submissions.

Comment: A few commenters stated that CMS should provide MIPS eligible clinicians or groups with two separate deadlines for informal review requests: an initial deadline whereby MIPS eligible clinicians can submit the request in time to have the error corrected before it affects payments, as well as a February 28th final deadline, which would both provide MIPS eligible clinicians or groups with an incentive to resolve a majority of payment issues in advance of claims processing, while still allowing MIPS eligible clinicians or groups adequate time to correct any inaccurate adjustments noticed in the first few payment periods of a new calendar year. Another commenter recommended that CMS give MIPS eligible clinicians or groups as much time as possible to submit targeted review requests since the adjustments will take time to understand and MIPS eligible clinicians or groups will simultaneously be working to report data

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for the subsequent performance period. Further, CMS should amend the informal review request forms to include fields that allow MIPS eligible clinicians to provide unique situational details, as well as upload supporting documentation. No requests for review should be rejected “automatically.” Rather, CMS should consider all review requests on a case-by-case basis, taking into account the unique circumstances of each request. Finally, the agency should make the targeted review decisions in a much more transparent manner.

Response: We appreciate the detailed suggestions for modifications to any request forms and will incorporate as feasible and appropriate. We do note however, that it is not feasible to allow for two targeted review periods, nor is it feasible to allow for the period to occur through February 28 of the MIPS payment year. We are required to begin adjusting MIPS eligible clinicians or groups’ claims for items and services furnished beginning January 1 of the MIPS payment year and cannot hold claims processing, nor is it desirable to re-process a large volume of claims. If we were to have multiple reviews, it would mean significant amounts of claims re-processing for MIPS eligible clinicians and ultimately disrupts their practice and creates confusion to their patients. Rather, as discussed above, we believe that a 60-day period to request targeted review is sufficient. We also appreciate the recommendations to provide as much time as possible for MIPS eligible clinicians or groups submitting targeted review requests. We believe that the targeted review period of 60 days after the MIPS payment factors are available provides sufficient opportunities for MIPS eligible clinicians or groups to request a targeted review.

Comment: Several commenters noted that MIPS eligible clinicians or groups should not be penalized due to data errors outside their control. Further, commenters stated that circumstances when third party intermediaries fail to successfully submit data completely or accurately need to be considered, and MIPS eligible clinicians should not be penalized.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Commenters also stated, based on previous informal review processes, MIPS eligible clinicians or groups were unfairly penalized due to third party intermediary errors. Commenters urged consideration for a two-fold approach to allow groups and MIPS eligible clinicians, who in good faith tried to submit data but were unsuccessful due to third party intermediary issue, to participate in MIPS. The two-fold approach includes: (1) the ability to resubmit correct data within a reasonable timeframe with evidence of good faith attempt; and (2) if resubmission is not feasible, a hold harmless policy from any penalty. Another commenter suggested that MIPS eligible clinicians or groups should not be unfairly penalized due to inactions or errors of external parties, including third party intermediaries and CMS itself, and should have the right to file an informal review request for reasons beyond their control at any point throughout the payment year and be retroactively reimbursed for all improper adjustments.

Response: We understand the concerns regarding third party intermediaries. As a general matter, the contractual agreement or other arrangement between a MIPS eligible clinician or groups and a third party intermediary is not within our control. We suggest that MIPS eligible clinicians or groups work with their third party intermediaries to ensure data is submitted timely and accurately. MIPS eligible clinicians or groups may be able to seek recourse against their third party intermediaries if significant issues or problems arise. We would like to note that at this time, we do not allow for resubmission of data. Rather, we use the original submitted data to evaluate a request for targeted review. We continue to express that MIPS eligible clinicians or groups are ultimately responsible for the data that are submitted by their third party intermediaries and expect that MIPS eligible clinicians or groups are ultimately holding their third party intermediaries accountable for accurate reporting. We will continue to explore the operational feasibility of allowing data resubmissions for subsequent years of the MIPS through future notice and comment rulemaking.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

After consideration of the comments, we are finalizing policies as proposed, except for changes specifically discussed to reflect the modified policy for the submission deadline to request a targeted review from July 31 to September 30 of the year prior to the MIPS payment year or a later date specified by CMS, as well as the change for the timeframe whereby MIPS eligible clinician or group may submit additional information to assist in their targeted review at the time of request from 10 days to 30 days.

Specifically, we are finalizing at §414.1385(a) that MIPS eligible clinicians or groups may request a targeted review of the calculation of the MIPS payment adjustment factor under section 1848(q)(6)(A) of the Act and, as applicable, the calculation of the additional MIPS payment adjustment factor under section 1848(q)(6)(C) of the Act applicable to such MIPS eligible clinician or group for a year. The process for targeted reviews is:

(1) MIPS eligible clinicians and groups have a 60-day period to submit a request for targeted review, which begins on the day CMS makes available the MIPS payment adjustment factor, and if applicable the additional MIPS payment adjustment factor, for the MIPS payment year and ends on September 30 of the year prior to the MIPS payment year or a later date specified by CMS.

(2) CMS will respond to each request for targeted review timely submitted and determine whether a targeted review is warranted.

(3) The MIPS eligible clinician or group may include additional information in support of their request for targeted review at the time the request is submitted. If CMS requests additional information from the MIPS eligible clinician or group, it must be provided and received by CMS within 30 days of the request. Non-responsiveness to the request for additional information may result in the closure of the targeted review request, although the MIPS eligible clinician or group may submit another request for targeted review before the deadline.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(4) Decisions based on the targeted review are final, and there is no further review or appeal.

#### d. Review Limitation

Section 1848(q)(13)(B) of the Act, as added by section 101(c)(1) of the MACRA, provides there shall be no administrative or judicial review under sections 1869 and 1878 of the Act, or otherwise of the following:

- The methodology used to determine the amount of the MIPS payment adjustment factor and the amount of the additional MIPS payment adjustment factor and the determination of such amounts;
- The establishment of the performance standards and the performance period;
- The identification of measures and activities specified for a MIPS performance category and information made public or posted on the Physician Compare Internet Web site of the CMS; and
- The methodology developed that is used to calculate performance scores and the calculation of such scores, including the weighting of measures and activities under such methodology.

We proposed at §414.1385 to implement these provisions as written in the statute.

We would reject any requests for targeted review under section 1848(q)(13)(A) of the Act that focus on the areas precluded from review under section 1848(q)(13)(B) of the Act. We requested but did not receive any comments on this proposal.

Therefore, we are finalizing §414.1385 as proposed.

#### e. Data Validation and Auditing

Our experience with the PQRS, VM and Medicare EHR Incentive Programs, has demonstrated the value of data validation and auditing as an important part of program integrity,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

which is necessary to ensure valid, reliable data. The current voluntary data validation process for PQRS and the audit process for the Medicare EHR Incentive Program are multi-step processes. We communicate the types of data elements that may be included for data validation across multiple Web sites and our documents. This includes defining specific data that may be abstracted from the CEHRT, as well as other documented records.

As we begin the MIPS, our strategy is to combine our past program integrity processes of the data validation process used in PQRS, and the auditing process used in the Medicare EHR Incentive Program into one set of requirements for MIPS eligible clinicians and groups, which we refer to as “data validation and auditing.” Based on our need for valid and reliable data on which to base a MIPS eligible clinician’s or group’s payment, we proposed certain requirements for MIPS eligible clinicians and groups submitting data for the 2017 performance period (see section II.E.4. of the proposed rule) under MIPS. Further, we proposed at §414.1390 to selectively audit MIPS eligible clinicians on a yearly basis, and that if a MIPS eligible clinician or group is selected for audit, the MIPS eligible clinician or group would be required to do the following in accordance with applicable law:

- Comply with data sharing requests, providing all data as requested by us or our designated entity. All data must be shared with us or our designated entity within 10 business days or an alternate timeframe that is agreed to by us and the MIPS eligible clinician or group. Data would be submitted via email, facsimile, or an electronic method via a secure Web site maintained by us.

- Provide substantive, primary source documents as requested. These documents may include: copies of claims, medical records for applicable patients, or other resources used in the data calculations for MIPS measures, objectives and activities. Primary source documentation also may include verification of records for Medicare and non-Medicare beneficiaries where

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

applicable.

We proposed that we would monitor MIPS eligible clinicians and groups on an ongoing basis for data validation, auditing, program integrity issues and instances of non-compliance with MIPS requirements. If a MIPS eligible clinician or group is found to have submitted inaccurate data for MIPS, we proposed that we would reopen, revise, and recoup any resulting overpayments in accordance with the rules set forth at §405.980 (re-opening rules), §450.982 and §450.984 (revising rules); and §405.370 and §405.373 (recoupment rules). It is important to note that at §405.980(b)(3) there is an exception whereby we have the authority to re-open at any time for fraud or similar fault. If we re-open the initial determination we must revise it, and send out a notice of the revised determination under §450.982. We also proposed that we would recoup any payments from the MIPS eligible clinician by the amount of any debts owed to us by the MIPS eligible clinician and likewise, we would recoup any payments from the group by the amount of any debts owed to us by the group. We also note that we would need to limit each such data validation and audit request to the minimum data necessary to conduct validation.

We proposed all MIPS eligible clinicians and groups that submit data to us electronically must attest to the accuracy and completeness to the best of their knowledge of any data submitted to us. This attestation would occur prior to any electronic data submissions, via a Web site maintained by us.

We requested comments on these proposals, and the following is a summary of the comments we received.

Comment: CMS received several comments regarding the details for audit. Commenters believed the proposed rule provided insufficient detail regarding payer responsibility and recommended that CMS provide greater detail and clarity around the auditing of contracts and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

any obligations or responsibilities payers will have as part of the auditing process. Other commenters requested that CMS, through the rulemaking process, address additional details about audits such as how audit contractors are compensated, how samples are chosen, and frequency of audits.

Response: We appreciate the requests to address details of the audit process; however, the process will be addressed through subregulatory guidance and, as noted in the proposed rule, we will selectively audit on an annual basis.

Comment: Commenters supported CMS' adding an independent audit with an appeals process to ensure due process is upheld.

Response: We appreciate commenters' support. However, we do want to note that there will not be a separate appeals for MIPS eligible clinicians outside of the targeted review process described in the preceding section of this final rule with comment period.

Comment: One commenter believed that it is important to institute rigorous independent (third party) validation and verification procedures to ensure accuracy and completeness of self-reported data. The commenter requested that validation requirements be similar to the requirements placed on Medicare Advantage plans and other government healthcare programs.

Response: Validation requirements will be provided to a MIPS eligible clinician or group in advance of an audit.

Comment: One commenter expressed concern that data validation processes will not address key systematic flaws in medical data collection reporting and evaluation such as honest data entry errors or intentional misrepresentation of a MIPS eligible clinician's performance. The commenter further recognized that the volume of data in MIPS may make it difficult to achieve accuracy in the data collection and reporting processes as well.

Response: We are concerned about data entry errors and its contribution to MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians' performance. We intend to thoroughly review all errors that are identified during data validation with careful consideration given to inadvertent and episodic data entry errors.

Comment: Commenters supported CMS's proposal to use only one set of auditing requirements for the MIPS program, as commenters believed this would reduce administrative burden and provide a unified approach to MIPS. Commenters also stated support for streamlining the auditing process.

Response: We thank the commenters and appreciate the support for a singular set of audit requirements and streamlining the auditing process.

Comment: Commenters believed that direct onsite auditing would be too burdensome for single MIPS eligible clinicians, small, and many midsize primary care organizations. Commenters proposed that no onsite auditing be performed for the first 2 performance periods until CEHRT developers and CMS can publish the details of how such audits will be conducted. Commenter suggested that (1) within these first 2 years, MIPS eligible clinicians or groups could volunteer to participate in 'beta' site testing of the proposed audit methodology and be given 'bonus' MIPS points added to their final score; or (2) Single solo practitioner organizations could be exempt from the onsite auditing requirement indefinitely, providing they show they have current support contracts in effect with both the CEHRT developer and/or third party quality organizations that assist the MIPS eligible clinician or group in maintaining compliance within the MIPS program requirements.

Response: Consistent with upholding the public trust in stewarding the Medicare Trust Fund, all MIPS eligible clinicians and groups that are scored under MIPS are required to respond to all audit requests and audit requirements will be provided in advance to selected MIPS eligible clinicians and groups. Since exemptions and other testing or audit methodologies suggested by the commenters are not consistent with equitable scoring, CMS has identified distinct audit

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

requirements for third party entities and auditing of eligible clinicians and groups. The audits of third party entities or intermediaries, if employed by an eligible clinician or group, are defined separately at §414.1400(j). MIPS eligible clinicians or groups will be audited on the provisions of care that contributed to their ability to report on an activity or measure. CMS will further make every effort to reduce reporting burdens for MIPS eligible clinicians and groups during audits.

Comment: A few commenters suggested that CMS clarify whether it or another entity will be the primary lead on data validation and auditing and the specific documents and data that must be available to pass an audit. Further, commenters requested CMS provide additional details regarding their methods for conducting audits, including what instructions or requirements other entities conducting the audits will be provided.

Response: Data validation and auditing remain under our control and authority, although as we have done for other programs, we may engage a contractor for certain aspects of the data validation and audit processes. Additional information identifying CMS contracted auditing entities and instructions regarding data validation and auditing will be provided through subregulatory guidance.

Comment: One commenter strongly recommended that CMS provide significant education to physicians about how the program operates, including the review and auditing procedures.

Response: We appreciate the recommendation and will provide education to MIPS eligible clinicians or groups about the data validation and audit processes. We will provide audit notices, audit instructions, and examples of data and charts needed for the validation of the provision of care attributable to the measures, objectives, and activities on which the MIPS eligible clinicians or group submitted data.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter stated that they share provider concerns related to validation of data from other payers.

Response: We appreciate the concern about data from other payers. Please note that validating data will be reviewed on a case by case basis and additional information will be provided through subregulatory guidance. During the transition year, data from other payers will be used for informational purposes to improve future validation efforts. Data from other payers will not be the only source of data used to make final determinations on whether an eligible clinician or group passes or fails an audit in the transition year. As noted previously, data sources for validation and audits include any primary source documents such as medical charts and other documents that are attributable to any measure or activity reported by an eligible clinician or group.

Comment: One commenter agreed that reporting patient data across all payers is important and believes that more time should be given to clinicians to synchronize data for non-Medicare patients.

Response: We appreciate comments identifying time needed to synchronize data and the potential reporting burden it may have on MIPS eligible clinicians or groups. We will review time requirements and extensions on a case by case basis for MIPS eligible clinicians or groups that require additional time during audits covering non-Medicare patients.

Comment: One commenter encouraged CMS to be consistently transparent in communicating with groups and in verification of their status. The commenter recommended that groups be able to address any inaccuracies or other issues in a transparent, timely fashion.

Response: Any MIPS eligible clinicians or groups that are subject to data validation and audits will have the ability to have any questions regarding their status addressed. We will make every effort to communicate the status of any audits conducted with the affected MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinician or group in a transparent, and timely fashion.

Comment: One commenter supported attestation of data submission accuracy and completeness and suggested that attestation be incorporated into the submission process, rather than through a separate portal.

Response: We proposed all MIPS eligible clinicians and groups that submit data to us electronically must, to the best of their knowledge, attest to the accuracy and completeness of any data submitted to us (81 FR 28280). We also proposed that this attestation would occur prior to any electronic data submissions, via a Web site maintained by us (81 FR 28280). However, after review of the comments, we are not finalizing this policy as proposed. We agree with the commenter and intend to build any attestation requirements related to data accuracy into the submission process, as technically feasible. We believe building any attestation requirements into the submission process will ease the burden for the MIPS eligible clinicians and groups to submit this type of data to us.

Comment: One commenter agreed with the strategy to combine the data validation process used in PQRS and the auditing process used in the Medicare EHR Incentive Program. The commenter agreed that MIPS eligible clinicians and groups must attest to the accuracy and completeness of any data submitted to CMS prior to any electronic data submissions to CMS.

Response: Thank you for your support to combine the data validation process used in PQRS and the auditing process used in the Medicare EHR Incentive Program. We intend to establish a unified data validation process across the performance categories for MIPS to conserve time and efforts for eligible clinicians and groups.

Comment: Several commenters requested that CMS release an audit guide to create more specific guidance prior to the beginning of the performance period so that MIPS eligible clinicians or groups know what documents and what formats would be required for auditing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

purposes. Further, commenters requested that CMS provide detailed information about how to be prepared for an audit, with descriptions of evidence. Commenters also recommended that CMS have sufficient resources to staff a Quality Payment Program Service Center and develop support materials to guide MIPS eligible clinicians and practice administrators through the review and audit process.

One commenter expressed concern that audit documentation requirements are not specified in the proposed rule because commenter believed such requirements in the past were not published until after the beginning of the performance year.

Response: Audit specifications will be provided through subregulatory guidance and MIPS eligible clinicians or groups selected for data validation and audits will be provided instructions and examples of documents required. Please note that documents that should be retained for data validation and audit would be primary source data and files, such as medical records and charts, demonstrating the provision of care consistent with what is reported during the performance period that is being validated or audited. Written communication documents that identify CMS contracted auditing entities, and audit response instructions will be provided through subregulatory guidance to assist eligible MIPS eligible clinicians and groups through the review and audit process. Please note, the Quality Payment Program Service Center is not the appropriate resource for MIPS eligible clinicians, groups or any staff, such as practice administrators, undergoing data validation and audits. CMS intends to utilize contracted auditing entities with sufficient staff to support and assist any eligible clinician, group, or staff, responding to an audit.

Comment: Commenters suggested a clear delineation of the expected audit and oversight of the program for both MIPS eligible clinicians or groups and third party intermediaries to ensure that everyone is prepared with the proper documentation for audits. Commenters were

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not able to identify how specifications on reporting are to be conducted.

Response: Specifications for reporting requirements during the audit will be provided to MIPS eligible clinicians and groups in advance of an audit. Please note that audits of third party intermediaries, if employed by an eligible clinician or group, are defined separately at §414.1400(j). MIPS eligible clinicians or groups will be audited on the provisions of care that contributed to their ability to report on an activity or measure.

Comment: A few commenters requested that CMS clearly define audit documentation for each of the MIPS measures and provide specific guidance regarding what data will be required and acceptable for attestation and audit purposes. The commenters suggested that specific audit guidelines and audit preparation instructions be a part of this implementation.

Response: Since the MIPS measures and activities have numerous and well defined requirements, we do not believe specific audit documentation requirements for each measure and activity would be useful. Audit documentation will be addressed with MIPS eligible clinicians and groups that are selected for audit. Instructions for completing the audit and examples of documents required, such as medical charts and files and other primary source documents, will be provided to the MIPS eligible clinicians and groups during the initial notice. MIPS eligible clinicians and groups should retain copies of medical records, charts, reports and any electronic data utilized to determine which measures and activities were applicable and appropriate for their scope of practice and patient population for reporting under MIPS for up to 10 years after the conclusion of the performance period to prepare for verification in the event they are selected for an audit. This record retention timeframe aligns with the record retention timeframes already in place for APMs either established in regulation or included in participation agreements. CMS may request any records or data retained for the purposes of MIPS for up to 6 years and 3 months.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Commenters requested that CMS specify in the final rule with comment period what type of audit requests a MIPS eligible clinician will have to respond to and specifically requested clarification on what would be needed to show they have implemented improvement activities.

Response: We assume that the commenters' request for clarification on "type of audit requests" is seeking clarification on what mode of communication we will use for audit requests. We will use varying mechanisms, which may include mail, e-mail or phone calls. MIPS eligible clinicians or groups will have to respond to all data validation and audit requests. Please note data validation and audits of the quality performance category for the transition year will examine a set of medical charts to verify that the encounters were reported accurately and meet quality measurement requirements. Data validation and audits of the other performance categories will be conducted in future years and additional information on data validation and audits of such categories will be provided through subregulatory guidance.

Comment: Commenters requested that prior to performing any audit for data validation, CMS provide MIPS eligible clinicians, facilities, and Medicare Administrative Contractors with guidance on how MIPS eligible clinicians or groups and facilities should document MIPS eligible clinicians' performance in source documents.

Response: Guidance on how primary source documents will be used in data validation and audits will be provided to selected MIPS eligible clinicians or groups in advance of an audit.

Comment: Several commenters supported auditing, but suggested that CMS set clear deadline expectations on both sides, and suggested that a 10-business day deadline for MIPS eligible clinicians or groups may not be feasible in all circumstances. The commenters suggested limiting burden on MIPS eligible clinicians or groups by allowing 30 days after a request is made and identifying the methodology to select MIPS eligible clinicians or groups for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

audit. Another commenter requested 45 days to respond to audit requests. While another commenter recommended 20 business days for a MIPS eligible clinician and 30 business days for a group. One commenter noted that this would prevent practices from being inadvertently penalized and remove the possibility that additional data requests would be inappropriately used by contractors as a tool to “manage” their workload. Another commenter recommended that absent any suspicion of wrongdoing, the timeframe for audits should be extended to 30 days, and CMS should consider reimbursement for time and effort required to meet the data submission requirements.

Response: We appreciate the commenters’ concerns and recommendations and note that we are revising the proposed 10 business day timeframe for compliance with data sharing requests to a 45-day timeframe. We note that when we refer to “days,” we generally mean “calendar days,” unless otherwise specified. We believe this timeframe is sufficient as this aligns with the post-payment audit timeframe employed by the Center for Program Integrity at CMS. We note that the timeframe applies equally to MIPS eligible clinicians and groups to maintain program consistency and the 45 day timeframe extends beyond any recommended dates from public responses provided. We believe that a more generous timeframe will enable both MIPS eligible clinicians or groups to satisfactorily comply with data sharing requests and to fully complete an audit in a manner that is consistent with the practices already established in the Medicare program. Please note that those subject to data validation and audits for the transition year will be based on a random selection from both MIPS eligible clinicians and groups, without consideration for suspicions of wrongdoing. We will take the commenter’s suggestion to provide reimbursement for time and effort required to meet data submission requirements into consideration. Details regarding any reimbursement will be communicate through subregulatory guidance.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Commenters urged CMS to initially take an educational as opposed to a punitive approach to audits and reviews, allowing CMS to collect and analyze “common errors” and publish “lessons learned” about the MIPS program so MIPS eligible clinicians, medical societies, and others can improve the chances of success under MIPS. Another commenter suggested that CMS approach auditing of this new program as an education tool to correct past mistakes.

Response: We appreciate the recommendation for a gradual audit process and enhanced education for MIPS eligible clinicians or groups. We also appreciate the recommendation to publish common errors and lessons learned from data validation and audits. We will provide examples of correct and incorrect documentation needed to educate and instruct MIPS eligible clinicians or groups identified and selected for audits and data validation and we will consider publishing additional documents in future years as the program matures. We also appreciate the feedback to use data validation and audits as an educational tool. Please note that during the transition year, the data validation and audit process will include education and support for MIPS eligible clinicians and groups selected for an audit.

Comment: Commenters had concerns with the proposal to "reopen, revise, and recoup any resulting overpayments" if a MIPS eligible clinician or group is found to have submitted inaccurate data for MIPS. Further, several commenters stated that audits and reviews should encourage education and the ability to learn from past mistakes rather than penalizing and recouping payments.

Response: We acknowledge the request to not make audits punitive. However, the proposal to pursue reopening and recoupment of payments is supported by our current authority to reopen and revise payment determinations, and to recoup any Medicare overpayments resulting from the submission of inaccurate data that is submitted. We note that any

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

recoupments of funds are not penalties; they are payment corrections. We routinely pursue recoupments based on identified overpayments that have been made.

Comment: One commenter recommended that CMS create an audit report that would detail areas in which MIPS eligible clinicians and groups did well and those where improvement was needed. The commenter further suggested that the report be organized by medical specialty and practice size.

Response: We cannot determine if the commenter is requesting a public audit report or a private audit report created for those MIPS eligible clinicians or groups that are selected for the audit. In the latter scenario, we intend to provide a report of specific feedback to those MIPS eligible clinicians or groups that are selected for an audit based on the result of the audit and our findings. In the former scenario, we appreciate the benefit of a public audit report and will therefore take this recommendation into consideration. We will further consider organizing the report, if provided, in a manner that most appropriately informs MIPS eligible clinicians and groups and will consider organizing the information by specialty and practice size.

Comment: One commenter suggested that CMS allow any group which, upon audit, has submitted inaccurate data to correct and resubmit the data before any revisions or recoupments would occur.

Response: We appreciate the request for groups selected for audit to have the ability to resubmit. However, please note that resubmission of data for recalculation during an audit is not technically feasible at this time. Furthermore, requests for recalculation for data errors would require a targeted review request, which will operationally occur before any audit and data validation processes begin. Since data validation and audits occur separately and after the completion of the performance period, the reporting period, and the targeted review period, we expect any MIPS eligible clinician or group to provide the most accurate and complete data as

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

possible to CMS.

Comment: Commenters supported a process whereby the MIPS scoring and penalties levied accurately reflect the true practice environment, but still had questions about the audit process.

Response: Thank you for your support of the scoring process and penalties under MIPS. We recognize commenters have questions about the audit process. Please note that audit notification, materials, examples and instructions will be provided to any MIPS eligible clinician or group selected by CMS for data validation and audit.

After consideration of the comments, we are finalizing the data validation policies as revised in this final rule with comment period. Specifically, we are finalizing §414.1390 as proposed to selectively audit MIPS eligible clinicians and groups on a yearly basis, and that if a MIPS eligible clinician or group is selected for audit, the MIPS eligible clinician or group will be required to do the following in accordance with applicable law and timelines CMS establishes:

- Comply with data sharing requests, providing all data as requested by CMS or our designated entity. All data must be shared with CMS or our designated entity within 45 days of the data sharing request, or an alternate timeframe that is agreed to by CMS and the MIPS eligible clinician or group. Data will be submitted via email, facsimile, or an electronic method via a secure Web site maintained by CMS.

- Provide substantive, primary source documents as requested. These documents may include: copies of claims, medical records for applicable patients, or other resources used in the data calculations for MIPS measures, objectives and activities. Primary source documentation also may include verification of records for Medicare and non-Medicare beneficiaries where applicable.

We are also finalizing that we will perform ongoing monitoring of MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians and groups on an ongoing basis for data validation, auditing, program integrity issues and instances of non-compliance with MIPS requirements. If a MIPS eligible clinician or group is found to have submitted inaccurate data for MIPS, we are finalizing that we would reopen and revise the determination in accordance with the rules set forth at §405.980 (re-opening rules), §450.982 and §450.984 (revising rules); and we would collect any overpayment in accordance with §405.370 and §405.373 (recoupment rules). It is important to note that at §405.980(b)(3) there is an exception whereby we have the authority to re-open at any time for fraud or similar fault. If we re-open the initial determination we must revise it, and send out a notice of the revised determination under §450.982. We also are finalizing our approach to recoup improper payments from the MIPS eligible clinician by the amount of any debts owed to us by the MIPS eligible clinician and likewise, we would recoup any payments from the group by the amount of any debts owed to us by the group. We also note that we would limit each data validation and audit request to the minimum data necessary to conduct validation. Based on comments received, we intend to use data validation and audits as an educational opportunity for MIPS eligible clinicians and groups; therefore, during the transition year, the data validation and audit process will include education and support for MIPS eligible clinicians and groups selected for an audit.

Lastly, we are finalizing that all MIPS eligible clinicians and groups that submit data to us electronically must attest to the best of their knowledge that the data submitted to us is accurate and complete.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

## 9. Third Party Data Submission

One of our strategic goals in developing MIPS includes developing a program that is meaningful, understandable, and flexible for participating MIPS eligible clinicians. One way we believe this will be accomplished is through flexible reporting options to accommodate different practices and make measurement meaningful. We believe this goal can be accomplished by allowing MIPS eligible clinicians the flexibility of using third party intermediaries to collect or submit data on their behalf. In this section, we are specifying the criteria that must be met to be approved by CMS as a third party intermediary. For purposes of this section, the use of the term “third party” refers to a qualified registry, a QCDR, a health IT vendor that obtains data from a MIPS eligible clinician’s CEHRT, or a CMS-approved survey vendor.

In the PQRS program, quality measures data may be collected or submitted by third party vendors on behalf of an individual EP or group by: (1) a registry; (2) a QCDR; or (3) an EHR vendor that obtains data from an EP’s CEHRT; or (4) a CMS-approved survey vendor. We proposed at §414.1400(a)(1) that MIPS data may be submitted by third party intermediaries on behalf of a MIPS eligible clinician or group by: (1) a qualified registry; (2) a QCDR; (3) a health IT vendor; or (4) a CMS-approved survey vendor. Furthermore, we proposed at §414.1400(a)(3) that third party intermediaries must meet all the criteria designated by us as a condition of their qualification or approval to participate in MIPS as a third party intermediary. As proposed at §414.1400(a)(3)(ii), all submitted data must be submitted in the form and manner specified by us.

The following is a summary of the comments we received regarding our proposed definition of third party data intermediaries.

Comment: Some commenters suggested that registries are foundational to population

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

health management, as registries foster care improvement, inform participants on needed focus areas, highlight performance areas for improvement, and identify which patients require interventions. The commenters also stated that registries are already in use by ACOs, and that under the proposal, MIPS eligible clinicians may satisfy the proposal's quality data reporting criteria by using data that is already being submitted to a clinical registry or to an ACO. Thus, the commenters expressed support for QCDR use under the proposal, as this reporting mechanism enhances the importance of existing registries that already seek to deliver high quality and high value care, and additionally streamlines reporting criteria for MIPS eligible clinicians.

Response: We appreciate the commenters' support for inclusion of qualified registries.

Comment: Some commenters requested that CMS recognize that changes to QCDRs, registries, and EHRs require significant financial resources and time to plan, incorporate, and test. The commenters added there must be ample notice in the rulemaking process for QCDRs, registries, and developers to plan and adequately meet these changes. The commenters encouraged CMS to establish a program update calendar to identify annual data management updates or reprogramming that is recurring and make an effort to adjust regulatory implementation dates to spread out the data collection, modifications, or updates so that they do not all occur during the last quarter of the calendar year.

Response: We aim to minimize changes to criteria whenever possible because we understand that implementing these changes can in certain instances be a lengthy process. However, at this time, we cannot provide a specific update calendar. We will adopt changes to the criteria through future rulemaking as necessary. We anticipate that as we gain experience under the MIPS, we will be able to establish a schedule or cycle of updates through future rulemaking.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Another commenter recommended that small practices be allowed to use PPRNET (Primary Care Practice Research Network - a practice based research network and QCDR) to help them submit measures for MIPS, and possibly other metrics.

Response: MIPS eligible clinicians may choose from several data submission mechanisms. If PPRNET satisfies the QCDR criteria and is approved by CMS as a third party intermediary, then it will be a data submission option available for those MIPS eligible clinicians who choose to use it.

After consideration of the comments, we are finalizing our policies as proposed. Specifically, we are finalizing at §414.1400(a)(1) that MIPS data may be submitted by third party intermediaries on behalf of a MIPS eligible clinician or group by: (1) a qualified registry; (2) a QCDR; (3) a health IT vendor; or (4) a CMS-approved survey vendor. Additionally, we are finalizing at §414.1400(a)(3) that third party intermediaries must meet all the criteria designated by CMS as a condition of their qualification or approval to participate in MIPS as a third party intermediary. Lastly, we are finalizing at §414.1400(a)(3)(ii), all submitted data must be submitted in the form and manner specified by CMS.

a. Qualified Clinical Data Registries (QCDRs)

Section 1848(q)(1)(E) of the Act requires the Secretary to encourage the use of QCDRs under section 1848(m)(3)(E) of the Act in carrying out MIPS. Section 1848(q)(5)(B)(ii)(I) of the Act requires the Secretary, under the final score methodology, to encourage MIPS eligible clinicians to report on applicable measures for the quality performance category through the use of certified EHR technology and QCDRs. Section 1848(q)(2)(B)(iii)(II) of the Act requires that the improvement activities subcategories specified by the Secretary include population management, such as monitoring health conditions of individuals to provide timely health care interventions or participation in a QCDR. Section 1848(q)(12)(A)(ii) of the Act requires the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Secretary to encourage the provision of performance feedback through QCDRs.

Section 1848(m)(3)(E)(i) of the Act requires the Secretary to establish requirements for an entity to be considered a QCDR, which must include a requirement that the entity provide the Secretary with such information, at such times, and in such manner, as the Secretary determines necessary to carry out section 1848(m) of the Act. Section 1848(m)(3)(E)(iv) of the Act requires the Secretary to consult with interested parties in carrying out section 1848(m)(3)(E) of the Act.

Currently, the QCDR reporting mechanism provides a method to satisfy PQRS requirements based on satisfactory participation. We proposed that entities interested in becoming a QCDR for MIPS go through a qualification process. This includes the QCDR meeting the definition of a QCDR, self-nomination criteria, and the criteria of a QCDR, including the deadlines listed below. This qualification process allows us to ensure that the entity has the capability to successfully report MIPS eligible clinicians' data to us and allows for review and approval of the QCDR's proposed non-MIPS quality measures. We intend to compile and post a list of entities that we "qualify" to submit data to us as a QCDR for purposes of MIPS on a Web site maintained by us.

Section 1848(q)(1)(E) of the Act encourages the use of QCDRs in carrying out the MIPS. Although section 1848(q)(5)(B)(ii)(I) of the Act specifically requires the Secretary to encourage MIPS eligible clinicians to use QCDRs to report on applicable measures for the quality performance category and section 1848(q)(12)(A)(ii) of the Act requires the Secretary to encourage the provision of performance feedback through QCDRs, the statute does not specifically address usage of QCDRs for the other MIPS performance categories. Although we could limit the usage of QCDRs to assessing the quality performance category under MIPS and providing performance feedback, we believe it would be less burdensome for MIPS eligible clinicians if we expand the QCDRs capabilities. By allowing QCDRs to report on the quality,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

advancing care information, and improvement activities performance categories we would alleviate the need for individual MIPS eligible clinicians and groups to use a separate mechanism to report data for these performance categories. It is important to note that no data will need to be reported for the cost performance category since these measures are administrative claims-based. Therefore, we proposed at §414.1400(a)(2) to expand QCDRs' capabilities by allowing QCDRs to submit data on measures, activities, or objectives for any of the following MIPS performance categories:

- Quality;
- Improvement activities; or
- Advancing care information, if the MIPS eligible clinician or group is using CEHRT.

We believe this approach would permit a single QCDR to report on the quality, advancing care information, and improvement activities performance category requirements for MIPS and should mitigate the risks, costs, and burden of MIPS eligible clinicians having to report multiple times to meet the requirements of MIPS.

We proposed to define a QCDR at §414.1305 as a CMS-approved entity that has self-nominated and successfully completed a qualification process to determine whether the entity may collect medical or clinical data for the purpose of patient and disease tracking to foster improvement in the quality of care provided to patients. Examples of the types of entities that may qualify as QCDRs include, but are not limited to, regional collaboratives and specialty societies using a commercially available software platform, as appropriate.

The following is a summary of the comments we received regarding our proposals on the definition of a QCDR and the performance categories for which a QCDR is allowed to submit data on behalf of MIPS eligible clinicians.

Comment: Several commenters agreed with the proposal to allow third party entities,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

such as QCDRs, to submit data for the categories of quality, advancing care information, and improvement activities. The commenters believed allowing MIPS eligible clinicians to use a single, third party data submission method reduces the administrative burden on MIPS eligible clinicians, facilitates consolidation, and standardization of data from disparate EHRs and other systems, and enables the third parties to provide timely, actionable feedback to MIPS eligible clinicians on opportunities for improvement in quality and value. Some commenters requested that CMS quickly release additional guidance to QCDRs regarding the capabilities that would be necessary to report the range of performance categories for the transition year of MIPS. One commenter believed this would allow for streamlined data submission and more complete feedback to MIPS eligible clinicians through QCDRs.

Response: We intend to finalize our proposal that QCDRs will have the flexibility to submit data on behalf of any of the following performance categories: quality, improvement activities, and advancing care information. In addition, we intend to release additional guidance to third party intermediaries regarding the submission standards that QCDRs would need to comply with for data submissions across the performance categories. We will publish this information at [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram) prior to the beginning on the performance period.

Comment: Another commenter was pleased that CMS understood the potential and value of QCDRs and included QCDRs as a reporting option across several of the MIPS components and improvement activities. For those performance categories where QCDR reporting is an option, such as improvement activities and advancing care information performance categories, the commenter requested that CMS outline specifics as soon as possible to ensure registry technology vendors can meet the needs of MIPS eligible clinicians selecting the MIPS pathway.

Response: We thank the commenter for their support of our proposals. In addition, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

intend to release additional guidance to third party intermediaries regarding the submission standards that QCDRs would need to comply with for data submissions across the performance categories. We will publish this information at [QualityPaymentProgram.cms.gov](https://www.qualitypaymentprogram.cms.gov) prior to the beginning of the performance period.

Comment: A few commenters did not support the criterion that QCDRs must have the capability to submit for all performance categories. The commenters believed that while this could reduce burden for MIPS eligible clinicians, choosing to support one or more performance categories is a business decision and should not be regulated and would limit the MIPS eligible clinician's choice of QCDRs in the early years of MIPS, as not all third party entities would necessarily be able to meet the criteria for submittal for all three performance categories.

Response: We would like to explain that we did not propose to require that QCDRs must have the capability to submit data for all performance categories, rather we proposed that they would have the option to do so. We agree with the commenters that requiring all QCDRs to be able to submit data for all performance categories is premature until stakeholders such as third party entities gain experience under the MIPS.

Comment: Another commenter agreed with and requested that CMS reinforce its definition of a QCDR as one that collects medical or clinical data for the purpose of patient and disease tracking to foster improvement in the quality care provided to patients. The commenter requested that CMS notify QCDRs as soon as possible if a non-MIPS QCDR measure will not be renewed in future years for other reason.

Response: We appreciate the commenters' support for our proposed definition of a QCDR. We would like to explain that QCDRs that have been previously approved under the PQRS program will need to self-nominate and confirm their ability to meet the requirements of a QCDR under the MIPS. We are not able to "grandfather" any existing QCDRs over from the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

PQRS program to the MIPS program. We do anticipate however that the overwhelming majority of QCDRs that were able to meet the requirements under PQRS will be able to meet the requirements under MIPS. Furthermore, we anticipate that the non-PQRS measures that QCDRs had approved under PQRS, would in most instances be approved as non-MIPS measures, if the QCDR chooses to submit these measures for approval to CMS.

After consideration of the comments received, we are finalizing the QCDR policies as proposed. Specifically, we are finalizing at §414.1400(a)(2) to expand QCDRs' capabilities by allowing QCDRs to submit data on measures, activities, or objectives for any of the following MIPS performance categories:

- Quality;
- Improvement activities; or
- Advancing care information, if the MIPS eligible clinician or group is using CEHRT.

Additionally, we are finalizing to define a QCDR at §414.1305 as a CMS-approved entity that has self-nominated and successfully completed a qualification process to determine whether the entity may collect medical or clinical data for the purpose of patient and disease tracking to foster improvement in the quality of care provided to patients. Examples of the types of entities that may qualify as QCDRs include, but are not limited to, regional collaboratives and specialty societies using a commercially available software platform, as appropriate.

(1) Establishment of an Entity Seeking to Qualify as a QCDR

We proposed at §414.1400(c) the establishment of a QCDR entity is required as follows: for an entity to become qualified for a given performance period as a QCDR, the entity must be in existence as of January 1 of the performance period for which the entity seeks to become a QCDR (for example, January 1, 2017, to be eligible to participate for purposes of performance periods beginning in 2017). The QCDR must have at least 25 participants by January 1 of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance period. These participants do not need to be using the QCDR to report MIPS data to us; rather, they need to be submitting data to the QCDR for quality improvement.

The following is a summary of the comments we received regarding the establishment of an entity seeking to qualify as a QCDR.

Comment: Some commenters proposed that in lieu of having an establishment requirement that aligns with the start of the performance period that CMS should consider options for making other aspects of the eligibility criteria more flexible.

Response: We believe that a QCDR should be established and collecting quality data at the time of self-nomination. Having a process to accept data and report it by the time the entity self-nominates reduces the chance that the entity will not be able to successfully submit their MIPS eligible clinician's data during the data submission period.

Comment: One commenter supported the proposal for the establishment of a QCDR entity, particularly that participants do not need to be using the QCDR to report MIPS data to CMS, but need to be submitting data to the QCDR for quality improvement. The commenter believed this would allow registries hosted by non-physician clinician groups to obtain QCDR certification despite lack of inclusion of such clinicians in the definition of a MIPS eligible clinician in the initial years of MIPS.

Response: We agree and thank the commenter for their support. We note that registries hosted by non-physician clinician groups may satisfy the QCDR criteria and be approved by CMS as a third party intermediary.

Comment: Some commenters requested clarification regarding what defines a participant (for example, reporting entity (group or clinician) or individual clinicians) in the requirement that a QCDR needs to have 25 participants by January 1 of the performance period.

Response: We would like to note that a "participant" is a MIPS eligible clinician.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Therefore, we require the QCDR to have 25 MIPS eligible clinicians by January 1 of the performance period to become qualified for a given performance period as a QCDR.

Comment: Other commenters stated that the expectations for QCDR self-nomination may be unrealistic for new endeavors. Specifically, requiring a QCDR to have at least 25 participants by January 1 of the performance period assumes the existence of the registry prior to self-nominating as a QCDR. Consequently, a registry would have to be in existence, based on its own structural requirements and specifications, before it could self-nominate. The commenter appreciated the decision to require self-nomination on an annual basis and supports the information criteria that CMS proposes for self-nomination. The commenter believed the data submission criteria outside the self-nomination process are too restrictive and should be revised and that the final rule with comment period should include appeals, grievance, and corrective action processes.

Response: We require at least 25 participants in an effort to ensure that potential QCDRs have experience in data collection and calculation capabilities. For appeals, MIPS has a targeted review process please refer to section II.E.8.c. of this final rule with comment period for more information

Comment: One commenter requested that CMS consider potential approval of the Scientific Registry of Transplant Recipients (SRTR) as a QCDR. The commenter also requested CMS work with the transplant community and assist in overcoming current barriers related to QCDR technical requirements. Other commenters requested that when CMS compiles the list of entities qualified to submit data as a QCDR, that CMS accept the Indian Health Service (IHS) Resource and Patient Management System (RPMS) as a qualified entity. The commenter requested CMS work with IHS to ensure that the RPMS is capable of meeting MIPS reporting criteria.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We would like to explain that while we will consider all entities that seek to qualify as a QCDR, we cannot conclude that a particular entity is capable of meeting our criteria in advance of the qualification process. It is important to note that an entity must meet the criteria in §414.1400(c) and be approved by CMS to qualify as a QCDR. We will develop further subregulatory guidance, including through tribal consultation to address issues raised by entities that want to be QCDRs.

After consideration of the comments received on the establishment of an entity seeking to qualify as a QCDR we are finalizing the policies as proposed. Specifically, we are finalizing at §414.1400(c) the establishment of a QCDR entity is required as follows: for an entity to become qualified for a given performance period as a QCDR, the entity must be in existence as of January 1 of the performance period for which the entity seeks to become a QCDR (for example, January 1, 2017, to be eligible to participate for purposes of performance periods beginning in 2017). The QCDR must have at least 25 participants by January 1 of the performance period. These participants do not need to be using the QCDR to report MIPS data to us; rather, they need to be submitting data to the QCDR for quality improvement.

(2) Self-Nomination Period:

For the 2017 performance period we proposed at §414.1400(b) a self-nomination period from November 15, 2016 until January 15, 2017. For future years of the program, starting with the 2018 performance period, we proposed to establish the self-nomination period from September 1 of the prior year until November 1 of the prior year. Entities that desire to qualify as a QCDR for the purposes of MIPS for a given performance period would need to self-nominate for that year and provide all information requested by us at the time of self-nomination. Having qualified as a QCDR in a prior year does not automatically qualify the entity to participate in MIPS as a QCDR in subsequent performance periods. For example, a QCDR may

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

choose not to continue participation in the program in future years, or the QCDR may be precluded from participation in a future year due to multiple data or submission errors as noted below. Finally, QCDRs may want to update or change the measures or services or performance categories they intend to provide. As such, we believe an annual self-nomination process is the best process to ensure accurate information is conveyed to MIPS eligible clinicians and accurate data is submitted to MIPS.

We proposed to require other information (described below) of QCDRs at the time of self-nomination. If an entity becomes qualified as a QCDR, they will need to sign a statement confirming this information is correct prior to listing it on their Web site. Once we post the QCDR on our Web site, including the services offered by the QCDR, we will require the QCDR to support these services or measures for its clients as a condition of the entity's qualification as a QCDR for purposes of MIPS. Failure to do so will preclude the QCDR from participation in MIPS in the subsequent year.

The following is a summary of the comments we received regarding the self-nomination period.

Comment: A few commenters agreed with the self-nomination period for the 2017 performance period.

Response: We appreciate the support from the commenters.

Comment: Some commenters opposed the proposed deadlines for QCDR self-nomination of January 15, 2017 for the 2017 performance period and November 1 for the 2018 performance period and beyond. Specifically, the commenters stated that if CMS finalizes a performance period for the 2019 MIPS payment adjustment of January 1, 2017 through December 31, 2017, the commenters requested that CMS extend the QCDR self-nomination deadline to March 31, 2017. Other commenters opposed the data proposed for QCDR self-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

nomination given the timing that regulations will be finalized and recommended extending the deadline to 3 months following the start of the performance period for the 2019 MIPS payment adjustment. Another commenter requested that CMS extend the self-nomination deadline to February 28, 2017. The commenter stated that QCDRs need additional time to determine that their systems will work with or can be updated to accommodate new MIPS requirements.

Response: We acknowledge the short timeline, but our intention was to complete the QCDR approval process as early as possible to allow MIPS eligible clinicians the most time in choosing the QCDR they intend to use. We note, that while QCDRs that have previously been approved under the PQRS program do need to self-nominate for consideration under the MIPS, we anticipate that the overwhelming majority of the existing QCDRs will be able to meet the requirements finalized here. The requirements to qualify as a QCDR have been fairly consistent since we started using QCDRs under the PQRS program.

After consideration of the comments received on the self-nomination period we are finalizing the policies as proposed. Specifically, for the 2017 performance period we are finalizing at §414.1400(b) a self-nomination period from November 15, 2016 until January 15, 2017. For future years of the program, starting with the 2018 performance period, the self-nomination period must occur from September 1 of the prior year until November 1 of the prior year. Entities that desire to qualify as a QCDR for the purposes of MIPS for a given performance period would need to self-nominate for that year and provide all information requested by us at the time of self-nomination.

We are finalizing our proposal to require other information (described below) of QCDRs at the time of self-nomination. All self-nomination information must be submitted to MIPS\_SelfNominations@cms.hhs.gov. If technically feasible we will accept self-nomination information via a web-based tool we will provide any further information on the web-based tool

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

at QualityPaymentProgram.cms.gov. If an entity becomes qualified as a QCDR, they will need to sign a statement confirming this information is correct prior to listing it on their Web site.

Once we post the QCDR on our Web site, including the services offered by the QCDR, we will require the QCDR to support these services or measures for its clients as a condition of the entity's qualification as a QCDR for purposes of MIPS. Failure to do so will preclude the QCDR from participation in MIPS in the subsequent year.

### (3) Information Required at the Time of Self-Nomination

We proposed that a QCDR must provide the following information to us at the time of self-nomination to ensure that QCDR data is valid:

- Organization Name (Specify Sponsoring Organization name and software vendor name if the two are different. For example, a specialty society in collaboration with a software vendor).

- MIPS performance categories (that is, categories for which the entity is self-nominating. For example, quality, advancing care information, or improvement activities).

- Performance Period.

- Vendor Type (for example, qualified clinical data registry).

- Provide the method(s) by which the entity obtains data from its customers for each performance category for which it is approved: claims, web-based tool, practice management system, CEHRT, other (please explain). If a combination of methods (Claims, web-based tool, Practice Management System, CEHRT, or other) is utilized, the entity should state which method(s) it utilizes to collect data (for example, performance numerator and denominator).

- Indicate the method the entity will use to verify the accuracy of each TIN/NPI it is intending to submit (for example, National Plan and Provider Enumeration System (NPPES), CMS claims, tax documentation).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Describe the method that the entity will use to accurately calculate performance rates for quality measures based on the appropriate measure type and specification. For composite measures or measures with multiple performance rates, the entity must provide us with the methodology the entity uses to calculate these composite measures and measures with multiple performance rates. The entity should be able to report to us a calculated composite measure rate if applicable.

- Describe the method that the entity will use to accurately calculate performance data for improvement activities and advancing care information based on the appropriate parameters or activities.

- Describe the process that the entity will use for completion of a randomized audit of a subset of data prior to the submission to us (for all performance categories the QCDR is submitting data on, that is, quality, improvement activities, and advancing care information, as applicable). Periodic examinations may be completed to compare patient record data with submitted data or ensure MIPS quality measures or other performance category (improvement activities, advancing care information) activities were accurately reported and performance calculated based on the appropriate measure specifications (that is, accuracy of numerator, denominator, and exclusion criteria) or performance category requirements.

- Provide information on the entity's process for data validation for both individual MIPS eligible clinicians and groups within a data validation plan. For example, for individuals it is encouraged that 3 percent of the TIN/NPIs submitted to us by the QCDR be sampled with a minimum sample of 10 TIN/NPIs or a maximum sample of 50 TIN/NPIs. For each TIN/NPI sampled, it is encouraged that 25 percent of the TIN/NPI's patients (with a minimum sample of five patients or a maximum sample of 50 patients) should be reviewed for all measures applicable to the patient.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Provide the results of the executed data validation plan by May 31 of the year following the performance period. If the results indicate the QCDR's validation reveals inaccuracy or low compliance provide to CMS an improvement plan. Failure to implement improvements may result in the QCDR being placed in a probationary status or disqualification from future participation.

- For non-MIPS quality measures, if the measure is risk-adjusted, the QCDR is required to provide details to us on their risk adjustment methodology (risk adjustment variables, and applicable calculation formula) at the time of the QCDR's self-nomination. The QCDR must submit the risk adjusted results to us when submitting a risk-adjusted measure on behalf of the QCDR's MIPS eligible clinicians for the performance period.

The following is a summary of the comments we received regarding information required at the time of self-nomination for QCDRs.

Comment: A few commenters stated that the self-nomination process for QCDRs does not allow flexibility to update or change information in response to a CMS review or a previous years' experience. The commenters believed that CMS should review measures and the validation strategy after the prior year's measure submission or CMS should have a process for allowing submission of modifications.

Response: We agree that timely feedback regarding the possible elimination of non-MIPS measures is important and are committed to providing this information to QCDRs as early as possible. We cannot wait for the data to be sent in for the prior year's submissions before finalizing QCDR information for the next performance period as doing so would mean that we could not publish the list of qualified QCDRs before the performance period. For example, this would mean that for the 2018 year, we would not be able to publish the list of QCDRs until summer 2018, which we believe is too late within the performance period for MIPS eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians to make their selection. That is, half of the performance period would have transpired before the list of qualified entities was publically posted.

Comment: One commenter requested that CMS remove the requirement for annual self-nomination when significant changes have not been made to the QCDR.

Response: We will take this under consideration as we develop the criteria for QCDRs in future years.

Comment: One commenter sought clarification from CMS regarding any changes to the QCDR self-nomination criteria for 2017 and beyond.

Response: Any changes to the self-nomination criteria for QCDRs would be addressed in future rulemaking.

Comment: Several commenters believed it was important to note that QCDR criteria for data validation plans are sufficient to ensure accuracy of data.

Response: We agree with the commenters' input.

Comment: Another commenter supported the criterion to have QCDRs submit risk-adjusted measure results.

Response: We appreciate the commenters' support.

Comment: One commenter stated that MIPS eligible clinicians should not be held responsible for errors or delays by third party intermediaries. The commenters stated CMS should require testing and provide data validation on data submitted to EHR vendors and QCDRs that is submitted to CMS. The commenters stated CMS should then inform MIPS eligible clinicians about any errors found through the data validation process.

Response: We are in the process of refining the testing process to facilitate accurate reporting. However, we note that MIPS eligible clinicians are ultimately responsible for the data that are submitted by their third party intermediary and we expect that they are holding their third

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

party intermediary accountable for accurate reporting. Additionally, we plan to have a probation and disqualification process for QCDRs with high error rates, as discussed below, in this final rule with comment period, in the section entitled “Probation and Disqualification of a Third Party Intermediary.” While we do not want to remove any QCDRs from participation, it is imperative that we (and MIPS eligible clinicians) receive accurate and actionable data.

Comment: Another commenter stated May 31 is too soon to provide the results of the executed data validation plan of the year following the performance period. A June 30 timeframe would be better.

Response: We appreciate the commenter’s concerns. However, we believe it is important to allow MIPS eligible clinicians time to select a QCDR before the performance period. Part of continued participation in the program for QCDRs is for CMS to review the data validation execution reports. As such, this date is needed for earlier publication of the following program year’s QCDRs.

Comment: Another commenter stated it is critical that CMS work with QCDRs to ensure that CMS can accept formats that allow each registry to demonstrate the unique features of its data, especially embedded risk adjustment.

Response: We encourage all non-MIPS measures be risk-adjusted (where appropriate) but it is up to the QCDR and measure developer or owner to define the risk-adjustment elements and methodology for the measure.

Comment: One commenter requested that CMS: (1) disclose publicly that the criteria for non-MIPS measures must meet to be approved; (2) articulate the circumstances under which a QCDR may be approved, but not its specialty-specific measures; and (3) delineate the practical implications for a QCDR that is approved through the self-nomination process when its non-MIPS measures are not.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: Approval of non-MIPS measures is part of the QCDR approval process. In cases where NO non-MIPS measures are approved but the QCDR is approved, the QCDR can elect to participate in the program reporting any MIPS measures the QCDR so chooses. We have included, in this final rule with comment period, in the section below entitled “Identifying Non-MIPS Quality Measures” the elements that will factor into CMS’ non-MIPS measure approval process.

Comment: Some commenters recommended that CMS allow a 3-year period of automatic measure approval through the QCDR self-nomination process.

Response: We do not believe that measures should be automatically approved for use by a QCDR for 3 years. As the science changes or the evidence evolves, measures may need to be updated or changed altogether. Additionally, we do not guarantee that a QCDR will be a qualified entity for 3 years. The QCDR’s tenure in the program is dependent on the QCDR’s desire to continue participating in the program and meeting the criteria for the program (including submitting accurate data and measure results).

After consideration of the comments received on the information required at the time of self-nomination for QCDRs we are finalizing the policies as proposed. Specifically, a QCDR must provide the information described above to us at the time of self-nomination to ensure that the QCDR data is valid.

#### (4) QCDR Criteria for Data Submission:

In addition, we proposed that a QCDR must perform the following functions:

- For measures under the quality performance category and as proposed at §414.1400(a)(4)(i), if the data is derived from CEHRT, the QCDR must be able to indicate this data source.
- QCDRs must provide complete quality measure specifications including data elements

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to us for non-MIPS quality measures intended for reporting from CEHRT.

- QCDRs must provide a plan to risk adjust (if appropriate for the measure) the non-MIPS quality measures data for which it collects and intends to transmit to us and must submit the risk-adjusted results (not the non-risk adjusted rates), to CMS. The risk adjustment methodology (formula and variables) must be integrated with the complete quality measure specifications. Specifically, for risk-adjusted non-MIPS quality measures, a QCDR is required to provide details to us on their risk adjustment methodology. The data elements used for risk adjustment may vary by measure and measure type. The risk adjustment methodology, including the risk adjustment variables, must be posted along with the measure's specifications on the QCDR's Web site. We believe risk-adjustment for certain outcomes measures is important to account for the differences in the complexities of care provided to different patients. That is, some patients may have additional comorbidities which could affect their response to treatment and subsequently their outcome. Risk adjustment will help offset potential poorer outcomes for those MIPS eligible clinicians caring for sicker patients.

- QCDRs submitting MIPS quality measures that are risk-adjusted (and have the risk-adjusted variables and methodology listed in the measure specifications) must submit the risk-adjusted measure results to CMS when submitting the data for these measures.

- Submit quality, advancing care information, or improvement activities data and results to us in the applicable MIPS performance categories for which the QCDR is providing data.

- A QCDR must have in place mechanisms for the transparency of data elements and specifications, risk models, and measures. That is, we expect that the non-MIPS measures and their data elements (that is, specifications) comprising these measures be listed on the QCDR's Web site unless the measure is a MIPS measure, in which case the specifications will be posted by us.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Submit to us data on measures, activities, and objectives for all patients, not just Medicare patients.
- Provide timely feedback, at least 6 times a year, on all of the MIPS performance categories that the QCDR will report to us. That is, if the QCDR will be reporting on data for the improvement activities, advancing care information, or quality performance category, all results as of the performance feedback date should be included in the information sent back to the MIPS eligible clinician. The feedback should be given to the individual MIPS eligible clinician or group (if participating as a group) at the individual participant level or group level, as applicable, for which the QCDR reports. The QCDR is only required to provide feedback based on the MIPS eligible clinician's data that is available at the time the performance feedback is generated.
- Possess benchmarking capability (for non-MIPS quality measures) that compares the quality of care a MIPS eligible clinician provides with other MIPS eligible clinicians performing the same quality measures. For non-MIPS measures the QCDR must provide us, if available, data from years prior (for example, 2015 data for the 2017 MIPS performance period) before the start of the performance period. In addition, the QCDR must provide us, if available, with the entire distribution of the measure's performance broken down by deciles. As an alternative to supplying this information to us, the QCDR may post this information on their Web site prior to the start of the performance period, to the extent permitted by applicable privacy laws.
- QCDRs must comply with any request by us to review the data submitted by the QCDR for purposes of MIPS in accordance with applicable law. Specifically, data requested would be limited to the minimum necessary for us to carry out, for example, health care operations or health oversight activities.
- Mandatory participation in ongoing support conference calls hosted by us

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(approximately one call per month), including an in-person QCDR kick-off meeting (if held) at our headquarters in Baltimore, MD. More than one unexcused absence could result in the QCDR being precluded from participation in the program for that year. If a QCDR is precluded from participation in MIPS, the individual MIPS eligible clinician or group would need to find another QCDR or utilize another data submission mechanism to submit their MIPS data.

- Agree that data inaccuracies including (but not limited to) TIN/NPI mismatches, formatting issues, calculation errors, data audit discrepancies affecting in excess of 3 percent of the total number of MIPS eligible clinicians submitted by the QCDR may result in notations on our qualified QCDR posting of low data quality and would place the QCDR on probation (if they decide to self-nominate for the next program year). If the QCDR does not reduce their data error rate below 3 percent in the subsequent year, they would continue to be on probation and have their listing on the CMS Web site continue to note the poor quality of the data they are submitting for MIPS. Data errors affecting in excess of 5 percent of the MIPS eligible clinicians submitted by the QCDR may lead to the disqualification of the QCDR from participation in the following year's program. As we gain additional experience with QCDRs, we intend to revisit and enhance these thresholds in future years.

- Be able to submit results for at least six quality measures including one cross-cutting measure and one outcome measure. If an outcome measure is not available, be able to submit results for at least one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures). If no outcome measure is available, then the QCDR must provide a justification for not including an outcome measure.

- QCDRs may request to report on up to 30 quality measures not in the annual list of MIPS quality measures. Full specifications will need to be provided to us at the time of self-nomination. We will review the quality measures and determine if they are appropriate for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

QCDR reporting.

- Enter into and maintain with its participating MIPS eligible clinicians an appropriate Business Associate agreement that provides for the QCDR's receipt of patient-specific data from an individual MIPS eligible clinician or group, as well as the QCDR's disclosure of quality measure results and numerator and denominator data or patient specific data on Medicare and non-Medicare beneficiaries on behalf of MIPS eligible clinicians and groups.

- Obtain and keep on file signed documentation that each holder of an NPI whose data are submitted to the QCDR, has authorized the QCDR to submit quality measure results, improvement activities measure and activity results, advancing care information objective results and numerator and denominator data or patient-specific data on Medicare and non-Medicare beneficiaries to CMS for the purpose of MIPS participation. This documentation should be obtained at the time the MIPS eligible clinician or group signs up with the QCDR to submit MIPS data to the QCDR and must meet the requirements of any applicable laws, regulations, and contractual business associate agreements. Groups participating in MIPS via a QCDR may have their group's duly authorized representative grant permission to the QCDR to submit their data to us. If submitting as a group, each individual MIPS eligible clinician does not need to grant their individual permission to the QCDR to submit their data to us.

- Not be owned and managed by an individual locally owned single specialty group (for example, single specialty practices with only one practice location or solo practitioner practices are prohibited from self-nominating to become a qualified QCDR).

- Be able to separate out and report on all payers including Medicare Part B FFS patients and non-Medicare patients.

- Provide the measure numbers for the MIPS quality measures on which the QCDR is reporting.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Provide the measure title for the MIPS quality measures and improvement activities (if applicable) on which the QCDR is reporting.

- Report the number of eligible instances (reporting denominator).
- Report the number of instances a quality service is performed (performance numerator).

- Report the number of performance exclusions, meaning the quality action was not performed for a valid reason as defined by the measure specification.

- Comply with a CMS-specified secure method for data submission, such as submitting the QCDR's data in an XML file.

- Sign a document verifying the QCDR's name, contact information, cost for MIPS eligible clinicians or groups to use the QCDR, services provided, and the measures and specialty-specific measure sets the QCDR intends to report. Once posted, on the QCDR's or CMS Web site, the QCDR will need to support the measures or measure sets confirmed by the QCDR. Failure to do so will preclude the QCDR from participation in MIPS in the subsequent year.

- Must provide attestation statements during the data submission period that all of the data (quality measures, improvement activities, and advancing care information measures and objectives, if applicable) and results are accurate and complete.

- For purposes of distributing performance feedback to MIPS eligible clinicians, collect a MIPS eligible clinician's email addresses and have documentation from the MIPS eligible clinician authorizing the release of his or her email address.

- Be able to calculate and submit measure-level reporting rates or, upon request, the data elements needed to calculate the reporting and performance rates by TIN/NPI and/or TIN.

- Be able to calculate and submit, by TIN/NPI and/or TIN, a performance rate (that is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the percentage of a defined population who receive a particular process of care or achieves a particular outcome based on a calculation of the measures' numerator and denominator specifications) for each measure on which the TIN/NPI or TIN reports or, upon request the Medicare beneficiary data elements needed to calculate the performance rates.

- Provide the performance period start date the QCDR will cover.
- Provide the performance period end date the QCDR will cover.
- Report the number of reported instances, performance not met, meaning the quality actions was not performed for no valid reason as defined by the measure specification.
- For data validation purposes, provide information on the entity's sampling methodology. For example, it is encouraged that 3 percent of the MIPS eligible clinicians be sampled with a minimum sample of 10 MIPS eligible clinicians or a maximum sample of 50 MIPS eligible clinicians. For each MIPS eligible clinicians sampled, it is encouraged that 25 percent of the MIPS eligible clinicians' patients (with a minimum sample of five patients or a maximum sample of 50 patients) should be reviewed for all measures applicable to the patient.
- Submit all of the measures (MIPS measures and non-MIPS measures) including specifications for the non-MIPS measures to us on a designated webpage. The measures must address a gap in care. Outcome or other high priority types of measures are preferred. Simple documentation or "check box" measures are discouraged.

The following is a summary of the comments we received regarding QCDR criteria for data submission.

Comment: A few commenters stated that some QCDRs were not designed to collect cross-cutting measures. Another commenter requested that CMS remove the requirement that MIPS eligible clinicians reporting the quality performance category via a QCDR must report on one cross-cutting measure and an outcome measure. The commenter believed CMS should

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

provide flexibly in light of the QCDR's specialty focus. Another commenter was concerned that extending the cross-cutting measure requirement to QCDRs would lessen the utility of QCDRs for specialties that do not have directly applicable measures on the cross-cutting measure list, and noted that only one proposed (and problematic) cross-cutting measure was applicable to emergency medicine. Further, the commenter was concerned that the cross-cutting measure requirement threatened to undermine QCDR's original goal of providing specialties flexibility to report on truly meaningful measures that were not tethered to a traditional measure set.

Response: As discussed in section II.E.5.b.(3) of this final rule with comment period, we have modified our proposal for the quality performance category for the transition year of MIPS. We are removing the requirement to report a cross-cutting measure and finalizing that for the applicable performance period, the MIPS eligible clinician or group would report at least six measures including at least one outcome measure. Due to this modification of criteria in the quality performance category, we are not finalizing the requirement that QCDRs must be able to report on a cross-cutting measure. We do strongly encourage, however, that where appropriate to their clients' scope of practice, these measures be incorporated. It is our expectation that QCDRs would be able to report program measures and their own non-program measures.

Comment: Several commenters disagreed with the following QCDR criteria for data submission due to privacy concerns: (1) submit to CMS data on measures, activities, and objectives for all patients, not just Medicare patients; and (2) be able to separate out and report on all payers including Medicare Part B FFS patients and non-Medicare patients. Another commenter sought clarification on why CMS wanted the submission of measures and activities on all patients from QCDRs, not just CMS beneficiaries. The commenters had concerns regarding HIPAA requirements.

Response: We desire all-payer data for all submission mechanisms, to create a more

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

comprehensive picture of the practice performance. Section 1848(q)(5)(H) of the Act authorizes the Secretary to include, for purposes of quality measurement and performance analysis, data submitted by MIPS eligible clinicians with respect to items and services furnished to individuals who are not Medicare beneficiaries. As discussed in section II.E.5.b. of this final rule with comment period, we are finalizing our proposal to require MIPS eligible clinicians to report all-payer data on quality measures where possible. We would like to explain that QCDRs should be able to supply sufficient information such that CMS, as well as the QCDR, can determine whether a given non-MIPS measure is “topped out,” as discussed in section II.E.5.c. of this final rule with comment period. Additionally, the information received by us is in the aggregate. That is, no personally identifiable health data is provided to CMS by registries or QCDRs.

Comment: One commenter supported CMS' proposal to use all-payer data for the QCDRs, qualified registry, and EHR submission mechanisms. The commenter recommended that CMS work with RHICs to incorporate multi-payer claims and clinical data into reporting mechanisms, and support regional data aggregators engaged in measurement and public or private reporting. In addition, the commenter recommended that CMS do more to incorporate all-payer data, including enabling data sharing through regional intermediaries.

Response: We appreciate the commenters’ support and will consider the suggestions in future rulemaking.

Comment: Some commenters stated they are concerned about administrative burden of data collection and measure reporting, especially the infrastructure changes that are necessary to be identified as a QCDR.

Response: We recognize that for those organizations that choose to become a QCDR there are certain requirements that must be met, which may be construed as burdensome. We would like to explain, however, that there is no requirement for any individual or organization to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

become or report via a QCDR. We will continue to work with stakeholders to ensure that any of our requirements do not become overly burdensome, but instead provide flexibilities both to the entities seeking to become a QCDR as well as to MIPS eligible clinicians.

Comment: Several commenters supported CMS' proposal to allow QCDRs to submit data for the quality, advancing care information, and improvement activities performance categories but noted that many QCDRs may only be able to submit data on the quality performance category. One commenter encouraged CMS to retain reporting in the three categories optional for QCDRs in the future. This commenter opposed the proposal to allow health IT vendors and qualified registries to submit data for all the MIPS categories, expressing concerns that this would be an unintended disincentive for these entities to become interoperable and that health IT vendors would have access to enormous amounts of data. Another commenter recommended that CMS provide significant flexibility with timelines to allow translating data into non-MIPS measures for inclusion in QCDRs. The commenter believed requiring QCDRs to submit data for all non-claims based MIPS performance categories will add to the value that they provide, although additional specifics related to submissions for the three categories are needed.

Response: We appreciate the commenters' support to allow QCDRs to submit data for the quality, improvement activities, and advancing care information performance categories. To explain, we did not propose to require that QCDRs must have the capability to submit data for all performance categories, rather we proposed that they would have the option to do so. We intend to provide flexibility to allow translating data into non-MIPS measures for inclusion in QCDRs.

Comment: Some commenters were concerned about expanding QCDRs' capabilities by allowing them to submit data on measures, activities, or objectives from quality, improvement activities, and advancing care information performance categories. The commenters were concerned that QCDRs would provide quality measure specifications including data elements for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

non-MIPS quality measures intended for reporting from CEHRT, thus allowing CMS to collect any data CMS wants by collecting it as a non-MIPS measure.

Response: We do not specify what measures QCDRs should develop, nor do we require that a specific QCDR be used by MIPS eligible clinicians or even a specific measure within the QCDR be submitted by a particular MIPS eligible clinician. Please reference the criteria for approval of non-MIPS measures discussed in section II.E.9.a.(6) entitled “Identifying Non-MIPS Quality Measures” of this final rule with comment period.

Comment: Other commenters requested that CMS continue to recognize QCDR-related activities on this list and to allow QCDRs to define specific improvement activities for MIPS eligible clinicians through the already-established QCDR approval process for measures and activities.

Response: We agree with this comment and will consider this in future program years as we gain more experience with the improvement activities performance category.

Comment: Several commenters did not endorse mandatory participation in the support calls, nor do they endorse mandatory in-person attendance at the QCDR kick-off meeting in Baltimore, MD, or the proposal that more than one unexcused absence could result in the QCDR or registry being precluded from participation in the program. The commenters believed the proposed data submission, validation, and ongoing auditing criteria are sufficient motivators to encourage QCDRs and qualified registries to utilize the support resources provided.

Response: We respectfully disagree. We believe mandatory participation in support calls and attendance at the QCDR kick-off meeting are important to help improve the reliability of the data CMS receives for scoring in MIPS. As the number of QCDRs increases and the complexity of the program grows, it may be necessary to have an in-person meeting at CMS central office in Baltimore, MD to convey the necessary information to QCDRs. As such, CMS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

wants assurance from potential QCDRs that they will attend an in-person meeting yearly if needed.

Comment: Another commenter requested clarification in the final rule with comment period on whether or not a MIPS eligible clinician's email address and release documentation is a requirement when metrics are being reported at the group level instead of the individual level.

Response: When reporting at the group level, we require that the QCDR or qualified registry obtain permission to submit data to CMS from the person authorized by the group to make decisions regarding participation in the Quality Payment Program. The QCDR or registry should maintain this documentation for 6 years and 3 months but does not need to send it to CMS unless requested. Similarly, the email of the group's representative should also be collected by the QCDR or qualified registry.

Comment: A few commenters agreed with the proposal that once the QCDR elects to submit specific measures, they must support those services or measures. The commenters requested that CMS provide clarification that throughout the performance period, QCDRs should be able to add MIPS measures to their lists of available services or measures as they have time to build those throughout the year. The commenters noted that they do not want to be limited to only supporting MIPS measures signed up for in November prior to the performance period, as final lists of available MIPS measures will not be available to the QCDR until that same November prior to the performance period. The commenters further noted that QCDRs will need time to include additional measures released by CMS in the final list of MIPS measures available for the performance period.

Response: We agree with the commenters and will allow for this flexibility to the fullest extent feasible. QCDRs are still required to submit their MIPS and non-MIPS measures to us by the deadlines of January 15<sup>th</sup> for the first performance period and by November 1 prior to the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance period for future years for review and approval by us. We will however on a case-by-case basis allow QCDRs and qualified registries to request review and approval for additional MIPS measures throughout the performance period. Any new measures that are approved by us will be added to the information related to the QCDR or qualified registry on the CMS Web site, as technically feasible. We anticipate only being able to update this information on the Web site on a quarterly basis, as technically feasible. We would like to explain that this flexibility would only apply for MIPS measures; QCDRs will not be able to request additions of any new non-MIPS measures throughout the performance period. Lastly, we note that QCDRs will not be able to retire any measures they are approved for during the performance period. Any measures QCDRs wish to retire would need to be retained until the next annual self-nomination process and applicable performance period.

Comment: Some commenters recommended that CMS further incentivize the creation of specialty-wide registries that ensure data collection efforts are not limited to data from individual EHRs; QCDRs must support whole specialties or disease categories.

Response: There are no provisions in the statute that expressly allow for this specialty-specific incentive. Furthermore, we believe that specialists should determine if there is a need for a specialty specific QCDR.

Comment: Other commenters requested that when a QCDR measure steward licenses a measure to another QCDR, the licensed measure does not count toward the 30 non-MIPS QCDR measure limit of the license. The commenters requested CMS provide adequate protections to safeguard any intellectual property associated with a measure steward's risk adjustment methodology, especially in regard to posting non-MIPS QCDR measure specifications.

Response: It is to the responsibility of the measure owner to address intellectual property safeguard concerns for non-MIPS measure specifications. Licensed non-MIPS measures will

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

still be considered in the total non-MIPS measures allowed for each QCDR that utilizes the measure. The work to incorporate the non-MIPS measure into the CMS system does not change if the measure is reported by one QCDR or more QCDRs.

Comment: A few commenters stated that CMS should allow QCDRs to give other QCDRs permission to use its measures. The commenters believed sharing measures across QCDRs allows similar types of MIPS eligible clinicians (for instance, those in a particular subspecialty) to report the same measure regardless of their TIN structure. In addition, the commenters stated CMS should request that when sharing these measures, QCDRs collaborate to establish benchmarks.

Response: We agree with this comment and currently allow and encourage the sharing of non-MIPS measures including benchmarking data, if desired, between QCDRs.

Comment: Another commenter stated CMS can improve the QCDR submission process by providing more guidance during the validation process, giving feedback on submission accuracy (and making the vendor responsible for submitting corrected data), and providing validation on calculated reporting and performance rates as data submitted (including flagging errors).

Response: We provide aggregate data issues information to each QCDR, that is, number and types of errors for individual QCDRs each year. We agree with the commenter that providing these additional data elements is beneficial. We are currently exploring ways to determine the operational feasibility of this under the MIPS.

Comment: A few commenters did not support the proposal to require performance feedback at least six times a year. Rather, the commenter encouraged four performance feedback instead, to allow a greater sample size in each report and additional time to risk-adjust measures. Another commenter stated four performance feedback would allow a greater sample size in each

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

report and additional time to risk-adjust measures.

Response: While we believe “real-time” feedback should be the goal for QCDRs, we acknowledge the extra burden six performance feedback will place on some entities and, as such, will modify the requirement to four performance feedback per year for the transition year of MIPS. However, please note we intend to increase the number of required performance feedback to six by MIPS payment year 2020 and will propose to require “real time” feedback as soon as it is technically feasible.

Comment: Some commenters stated that if a QCDR or other entity does not submit accurate data, then the MIPS eligible clinicians using that reporting mechanism should not be penalized and instead should be assessed as “average” for the impacted performance category(ies).

Response: We do not guarantee that QCDRs will be successful in submitting data to us. MIPS eligible clinicians should carefully consider the reputation of the entity when making their vendor selection. We note that practices are ultimately responsible for the data that are submitted by their third party intermediaries and expect that they are ultimately holding their third party intermediaries accountable for accurate reporting. We are planning to note entities with high data errors on the published list of QCDRs in the future. Please refer to section II.E.6. of this final rule with comment period for further information on scoring.

Comment: Other commenters stated it would be helpful for CMS to inform stakeholders of calculation errors and anything that does not comply with specifications, such as zero rates, as early as possible. The commenters stated that if testing requires any type of practice audit or request for information from practices for data validation purposes, CMS should inform vendors of any communication to practices so that vendors can work with CMS to ensure that practices understand the purpose of the validation request. In addition, the commenters stated that in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

advance of, or concurrent with, updates to quality measures, CMS should clearly identify a timeline when testing tools will be available and at what point the version will be “static.”

Finally, the commenters stated that suggested milestones should be made available so that health IT vendors can incorporate measure testing into their product’s timeline.

Response: We currently report many types of errors to the submitting entity at the time of submission. Additionally, timelines are reviewed on each support call (monthly leading up to and during the submission window) as well as notification of specifications and the availability of the testing tool.

Comment: A few commenters stated while CMS provides proposals for third party intermediaries to be disqualified due to data errors, the commenters believed it was important to establish a standardized testing process in the beginning, prior to the data submission period, so the data was as accurate as possible as they are analyzed for the purpose of scoring MIPS eligible clinicians and groups. The commenters stated CMS should offer a voluntary testing window each quarter. The commenters added that vendors that opt to take advantage of this testing window should receive feedback on whether files are transmitted appropriately.

Response: We currently offer pre-submission testing for QCDRs under PQRS and intend to continue to offer a similar function under MIPS. We cannot currently provide a timeline for availability of this testing function but we do note that it will be made available to QCDRs prior to the submission period. We envision that this testing function will mimic the submission process as closely as technically feasible. We will provide additional details on this testing process through QCDR support calls and at the [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram).

Comment: Another commenter requested additional clarity regarding the requirement to provide information on the entity's process for data validation for both individual MIPS eligible clinicians and groups within a data validation plan. While the commenter believed it was

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reasonable to expect vendors who are also registries to perform quality assurance testing to confirm that calculations are correct and based on the data in the fields being sampled, the proposal suggests a more detailed review of individual patients' charts, which the commenter believed would be impossible for vendors who are receiving only an extract of the fields necessary to calculate measures and not extracting the entire record.

Response: We do not mandate the specifics of the data validation strategy; rather, we suggest examples of previously accepted plans. It is the responsibility of the entity to ensure the data given to them by the MIPS eligible clinician is both accurate and complete. The attestation statement required at the time of submission requires the entities to stand behind the data they submit. Entities may need to work with their MIPS eligible clinicians to have the needed chart access for data verification.

Comment: Some commenters supported CMS' efforts to ensure the integrity of data and appreciated the proposal to provide an initial probationary period where the entity is given the opportunity to correct identified issues. However, immediate disqualification could adversely affect entities, such as a QCDR, that, because of lack of experience or an unintentional error, failed to meet data integrity standards. The commenter noted it would also adversely impact the MIPS eligible clinicians who rely on these entities to satisfy federal quality reporting mandates.

Response: We appreciate the comment and do not want QCDRs to be eliminated from the program, however, we must balance our goal of QCDR inclusion with the need to receive accurate and usable data. Neither the MIPS eligible clinicians nor the MIPS program will benefit from inaccurate data as known inaccurate data cannot be used in the program for payment or calculation of benchmarks. We refer readers to section II.E.9.e. entitled "Probation and Disqualification of a Third Party Intermediary" of this final rule with comment period for more information on probation and disqualification of third party intermediaries.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Other commenters requested more transparency concerning the review of non-MIPS measures in QCDRs. The commenters noted that in the past the review of these measures has been conducted with limited input from the measure owners, and with less than 24 hours to formulate a response. The commenters believed with clearer guidance, this process could be more effective at identifying gaps in care.

Response: We have provided additional clarification, in this final rule with comment period in section II.E.9.a.(6) entitled “Identifying Non-MIPS Quality Measures,” for the criteria we will use in considering measures and their suitability for the MIPS program. As the measures are expected to be fully developed prior to self-nomination, the additional requested information should be readily available to the QCDR. Additionally, QCDRs will not be given less than 24 hours to respond to CMS when initially being asked for measure clarification.

Comment: A few commenters supported the proposal allowing QCDRs to submit either XML or QRDA formats. The commenters believed that these format determinations were best made by each individual QCDR. The commenters appreciated that CMS is not proposing to require QCDRs to use only QRDA for capturing and transmitting data. The commenters stated that CMS should work with registries and other stakeholders to identify emerging standards that support a more scalable and flexible data reporting format.

Response: We appreciate the commenters’ support. We will continue to work with QCDRs and other stakeholders to identify and improve our data transmission formats and methods.

Comment: Other commenters supported CMS’ proposals to allow QCDRs to define specific improvement activities for specialty and non-patient facing MIPS eligible clinicians through the existing QCDR approval process for measures and activities.

Response: We appreciate the support.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Some commenters opposed the proposal that the QCDR must be able to indicate the data source if the data was derived from CEHRT because it would be difficult to require QCDRs to parse out which data fields are populated from EHRs.

Response: This information is necessary to give MIPS eligible clinicians additional credit for using CEHRT for the quality performance category. These bonus points are described in more detail in section II.E.6.a.(2)(f) of this final rule with comment period.

Comment: Other commenters did not believe QCDRs should be held responsible for TIN/NPI mismatches, as QCDRs rely on the MIPS eligible clinicians to provide accurate TIN/NPI information. Rather, the commenters requested that CMS allow QCDRs to run tests similar to SEVT testing, ideally in the middle of the performance period, to allow QCDRs to determine whether TIN/NPI inaccuracies exist.

Response: We are exploring the technical feasibility of allowing this type of testing under the MIPS.

Comment: Some commenters supported the requirement for vendors to complete CMS-sponsored submission testing and requests that CMS include in its testing tools and Submission Engine Validation Tool (SEVT) process, validation of data content as well as format.

Response: We support the commenter's sentiment. As noted previously, we intend to offer a pre-submission testing process that will mimic as closely as possible the MIPS submission process QCDRs would experience.

Comment: A few commenters stated they supported: (1) allowing flexible reporting options, such as contracting with third party submitters to report on behalf of QCDR owners and agreed with CMS that third party intermediaries should meet all criteria designated by CMS as a condition of their qualification or approval to participate in MIPS; (2) agreed that requiring the use of the QRDA could continue to be a reporting impediment for XML-based third party

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

submitters; (3) concurred that CMS should be cautious in too quickly moving entities to a probationary phase because of difficulties encountered while making good faith efforts to comply with CMS' complex processes; and (4) believed that aligning CMS processes with ONC certification requirements would be highly preferable to adding an additional CMS process to assure CMS form and manner requirements are met. Other commenters generally agreed with the proposal to require data submission vendors to submit data in the form and manner approved by CMS. In addition, they agreed with the proposal to allow the vendor to submit data for three performance categories through the third party intermediary.

Response: We agree and appreciate the support. We will monitor readiness, explore areas to streamline, and align electronic clinical quality measure (eCQM) development, testing, certification of products to the eCQM specifications and use of these measures in CEHRT and in reporting. Some QCDRs may choose to certify and may be working toward eCQM development, and CMS and ONC are committed to supporting this effort; however, we recognize that readiness among QCDRs even for MIPS eCQM certification is varied. We recognize that QCDRs may use data other than or in addition to that available from CERHT for their measures. In addition, some QCDRs are already successfully collecting and reporting measures for CMS programs without use of standards-based formats. Therefore, we are not requiring QCDRs be, use, or connect to CEHRT in order to report data under any MIPS performance category.

Comment: A few commenters supported the proposal regarding QCDRs and other intermediaries providing feedback to participants on quality measures.

Response: We appreciate the commenters support.

Comment: Another commenter strongly supported CMS maintaining its current policy for reporting criteria in which QCDRs have a choice regarding public reporting strategies.

Response: We appreciate the commenters' support. We refer readers to section II.E.10.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of this final rule with comment period for final policies regarding public reporting on Physician Compare.

Comment: Other commenters suggested providing flexibility for QCDRs. The commenters appreciated the proposals to foster the growing acceptance of QCDRs in clinical care, but stated it can only be achieved if CMS recognizes that QCDRs need the flexibility to incorporate measures into the registry as each specialty or clinician field sees fit for its patient population.

Response: We appreciate the comment, however there are basic criteria for quality measures to be included in our program. These are outlined in section II.E.5.c. of this final rule with comment period.

Comment: Some commenters requested clarification as to why CMS is proposing to measure requirements that may not be relevant to the data the registry collects, especially when QCDR measures will be held to such a high threshold of review.

Response: QCDR measures are expected to at least meet the regular MIPS measures requirements. Measures included in MIPS also undergo scrutiny including having to go through the MUC/MAP process. If the commenter is questioning why we require certain data elements such as the source of the data (that is, EHR, web portal, claims, etc.), this is needed to provide bonus points, when applicable, to MIPS eligible clinicians who are using certified EHR technology to collect and manage quality measures data.

Comment: Some commenters recommended extending the deadline for QCDR submission of measures to April 30th following the performance year because American College of Surgeons (ACS) registries used as QCDRs generally have a lock date of 90 days past the date of surgery to allow ample time to track outcomes in which no data is received. Following the 90-day lock data, time is needed for data analysis and risk adjustment. The commenters

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

indicated that the current submission deadline would not permit the submission of data for October, November or December, which is a high-volume period for surgery.

Response: We acknowledge the commenter's concern, but we cannot extend the data submission timeframe and still have adequate time to process the information and make the appropriate calculations for accurate scoring for the MIPS.

Comment: Other commenters requested that CMS provide clearer guidance on what specific criteria must be met for a measure to fall into each specific high priority measures well in advance of the QCDR self-nomination process.

Response: The measures that are considered high priority are outcomes, appropriate use, patient safety, efficiency, patient experience, and care coordination.

Comment: One commenter encouraged CMS work with QCDR applicants to provide them feedback on measures that are submitted in the application process.

Response: We have held calls with potential QCDRs in the past to discuss measure issues and potential measures. In addition, we have worked and will continue to work with potential QCDRs and provide feedback on self-nominated measures.

Comment: Other commenters were very disappointed with CMS's decision not to adopt new policies or procedures to implement section 105(b) of MACRA (Pub. L. 114-10) which requires CMS to provide QCDRs with access to Medicare data for purposes of linking such data with clinical outcomes data and performing scientifically valid analysis or research to support quality improvement or patient safety. The commenters believed that CMS also ignored the fact that section 105(b) of MACRA is intended to provide QCDRs with access to Medicare data for quality improvement purposes, not just research, and that the broad and continuous access needed for quality improvement purposes is fundamentally different than the access to Medicare data for research purposes provided by Research Data Assistance Center (ResDAC). The

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenters stated that CMS's decision not to issue a rule implementing section 105(b) of MACRA violates the black letter principles of statutory construction. The commenters believed CMS should match Medicare claims data with Social Security Death Master File (SSDMF) death data before providing it to QCDRs to greatly enhance the accuracy and robustness the Medicare claims data. Some commenters stated that the Secretary should match Medicare claims data with SSDMF data before providing it to QCDRs. Because the commenters believed that the ultimate purpose for accessing death data was to enhance the accuracy of patient outcomes information, including verification of patient life status and date of death, and not the acquisition of the actual death data set itself, QCDRs would greatly benefit from the Secretary matching Medicare claims data with SSDMF death data to verify patient death status, and sharing the matched data set with QCDRs.

Response: We recently finalized regulations at 42 CFR part 401.722 to implement section 105(b) of MACRA. As discussed in the Medicare Program; Expanding Uses of Medicare Data by Qualified Entities final rule published in the July 7, 2016 **Federal Register** (81 FR 44471), we recognize that the research request pathway may not be consistent with the types of analyses QCDRs envision conducting using the CMS data. As a result, we finalized regulations to allow QCDRs to serve as quasi-qualified entities. The qualified entity program, which was created by section 10332 of the Affordable Care Act and modified by section 105 of MACRA, authorizes us to provide standardized extracts of Medicare Parts A and B claims data and Part D event data to approved qualified entities. Qualified entities must combine the Medicare data with claims data from other sources and use the combined data to produce public performance reports on providers and suppliers. Qualified entities may use the combined data to conduct non-public analyses and provide or sell these analyses to certain authorized users. They may also provide or sell the combined data or provide the Medicare claims data alone at no cost

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to providers, suppliers, hospital associations, and medical societies.

Under the regulations at §401.722, QCDRs are allowed to serve as quasi qualified entities, provided the QCDR agrees to meet all the requirements of the program with the exception of the requirement at § 401.707(d) that the organization submit information about the claims data it possesses from other sources. In addition, for the purposes of QCDRs serving as quasi qualified entities, we defined combined data as, at a minimum, CMS claims data combined with clinical data or a subset of clinical data. We believe that the requirements of the qualified entity program create an appropriate framework for QCDRs to conduct analyses to support quality improvement and patient safety and to work directly with providers and suppliers on issues related to quality improvement and patient safety.

With regard to the SSDMF, we recognize that death information is a key aspect of analyses of patient outcomes, but we do not have the authority to disclose the SSDMF to QCDRs. However, we have the date of death information for Medicare patients and we include this date of death information on the data files that are shared with qualified entities and those that are shared with QCDRs who are approved as quasi qualified entities.

Comment: One commenter requested that CMS clarify whether QCDR quality data can be submitted through the QRDA standard and whether QCDRs may report eQCMs.

Response: QCDRs may elect to report any MIPS measures, including eQCMs. Additionally, if the data required for a non-MIPS measures is captured electronically in the proper manner as defined in CEHRT, the data can be sent to the QCDR electronically and used as a non-MIPS eQCM. QCDRs will be able to use the data submission standard when submitting their MIPS eQCMs. Additional details will be provided on the Quality Payment Program data submission standard via QCDR support calls and at [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Some commenters recommended that CMS provide MIPS eligible clinicians with cost estimates for electronic data submissions through registries and EHRs, as well as time estimates for submission of attestations through the CMS Web Interface to assist MIPS eligible clinicians in determining which submission method would be the least burdensome and most cost-effective.

Response: We have information related to the burden of participation in section III.B.12. of this final rule with comment period. Additionally, we will post cost data for registries and QCDRs on the qualified posting list.

Comment: A few commenters stated that the proposal should emphasize the role of QCDRs to ensure reporting and data submission are flexible, meaningful, and useful. The proposed QCDR data completeness requirement increasing from 50 to 90 percent would require reassuring MIPS eligible clinicians of the value of QCDR participation and reporting. One commenter requested Medicare claims data access to QCDRs be considered in future rulemaking.

Response: Based on the overwhelming feedback received, we do not intend to finalize the data completeness thresholds as proposed. The numerous details the commenters cited on the increased burden the data completeness thresholds will impose on MIPS eligible clinicians is not intended. We want to ensure that an appropriate, yet achievable, level of data completeness is applied to all MIPS eligible clinicians. Based on stakeholder feedback for the transition year of MIPS, as discussed in section II.E.5.b.(3)(b) of this final rule with comment period, we will finalize a 50 percent data completeness threshold for claims, registry, QCDR, and EHR submission mechanisms. Additionally, we will take the commenter's request for access to Medicare claims data into consideration for future rulemaking.

Comment: Some commenters stated that March 31 is a welcome extension from the Feb

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

28 submission deadline. They also stated that bi-annual and quarterly reporting would be advantageous only if CMS intends to provide timely quarterly feedback to MIPS eligible clinicians. The commenter stated that because of the added burden of submission throughout the reporting year, this reporting option would only be useful when CMS can provide feedback that quickly. Additionally, if quarterly reporting would be required going forward, EHR vendors would need to have additional notice regarding measure additions and updates in order to prepare for a sooner submission period than had been required under annual reporting. Finally, the commenters stated that a January 1 submission deadline seems unnecessary since most practices are closed for the New Year holiday. Further MIPS eligible clinicians need several days to compile their data after the last day of the performance period. The commenters suggested that CMS consider delaying the data submission period to January 15-April 15 so that reports could be compiled and tested for submission prior to the open of submission. Additionally, the submission portal should have fewer down times during the 1st quarter to compensate for MIPS eligible clinicians submitting their files. The commenters suggested limiting the maintenance in the first quarter to only have two scheduled downtimes, one in January and one in February, leaving all of March, when heavy data submission is occurring.

Response: We cannot extend the submission period to April 15 and still process the data, calculate the final score and perform the other necessary tasks in time to make MIPS payment adjustments for the upcoming payment year. With respect to the downtime of our system, the system is shared by multiple components and programs at CMS and thus maintenance weekends must occur regularly throughout the year. We do note that we publish the scheduled maintenance weekends in advance so QCDRs have the ability to build these downtimes into their schedules for data submission.

Comment: One commenter noted that they could not measure MIPS eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

by individual patient outcomes, but could measure and accredit team-based performance. The commenter's outcomes registry cannot be a qualified reporting registry for MACRA as currently proposed, because its outcomes are not and could never be physician--specific. The commenter suggested that CMS take advantage of commenter's Center for International Bone Marrow Transplant Research registry, not only for evaluating team-based quality outcomes for hematopoietic SCT (HCT) patients but for assistance in helping other specialties with team-based care enhance their outcomes reporting.

Response: CMS allows group reporting by qualified registries and QCDRs. If the “team” referred to in the comment practices under one tax identification number (TIN), the measures (if reported by a QCDR and approved by CMS) could be reported for all of the MIPS eligible clinicians under the particular TIN.

After consideration of the comments received on the QCDR criteria for data submission we are finalizing our policies as proposed, with the following exceptions: specifically, we have decided to alter the requirement to provide timely feedback to MIPS eligible clinicians six times a year. Rather based on feedback from stakeholders we will finalize the requirement as follows: Provide timely feedback, at least four times a year, on all of the MIPS performance categories that the QCDR will report to us. That is, if the QCDR will be reporting on data for the improvement activities, advancing care information, or quality performance category, all results as of the performance feedback date should be included in the information sent back to the MIPS eligible clinician. The feedback should be given to the individual MIPS eligible clinician or group (if participating as a group) at the individual participant level or group level, as applicable, for which the QCDR reports. The QCDR is only required to provide feedback based on the MIPS eligible clinician’s data that is available at the time the performance feedback is generated.

Additionally, based on our policies finalized in section II.E.5.b.(3) of this final rule with

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

comment period, we are not requiring MIPS eligible clinicians to submit data on cross-cutting measures. Therefore, we are finalizing the requirement at §414.1335(a)(1)(i) for QCDRs as follows: Be able to submit results for at least six quality measures including one outcome measure. If an outcome measure is not available, be able to submit results for at least one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures). If no outcome measure is available, then the QCDR must provide a justification for not including an outcome measure.

(5) QCDR Measure Specifications Criteria:

A QCDR must provide specifications for each measure, activity, or objective the QCDR intends to submit to CMS. We proposed at §414.1400(f) the QCDR must provide the following information:

- Provide descriptions and narrative specifications for each measure activity, or objective for which it will submit to us by no later than January 15 of the applicable performance period for which the QCDR wishes to submit quality measures or other performance category (improvement activities and advancing care information) data. In future years, starting with the 2018 performance period, those specifications must be provided to us by no later than November 1 prior to the applicable performance period for which the QCDR wishes to submit quality measures or other performance category (improvement activities and advancing care information) data.

- For non-MIPS quality measures, the quality measure specifications must include: name or title of measures, NQF number (if NQF-endorsed), descriptions of the denominator, numerator, and when applicable, denominator exceptions, denominator exclusions, risk adjustment variables, and risk adjustment algorithms. The narrative specifications provided must be similar to the narrative specifications we provide in our measures list. CMS will consider all

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

non-MIPS measures submitted by the QCDR but the measures must address a gap in care and outcome or other high priority measures are preferred. Documentation or “check box” measures are discouraged. Measures that have very high performance rates already or address extremely rare gaps in care (thereby allowing for little or no quality distinction between MIPS eligible clinicians) are also unlikely to be approved for inclusion.

- For MIPS measures, the QCDR only needs to submit the MIPS measure numbers and the specialty-specific measure sets (if applicable).
- The QCDR must publicly post the measure specifications (no later than 15 days following our approval of these measure specifications) for each non-MIPS quality measure it intends to submit for MIPS. The QCDR may use any public format it prefers. Immediately following posting of the measures specification information, the QCDR must provide us with the link to where this information is posted. We would then post this information when it provides its list of QCDRs for the year.

The following is a summary of the comments we received regarding QCDR measure specifications criteria.

Comment: A few commenters opposed CMS' proposal to have measures specifications submitted by January 15, as they do not believe this gives enough time for QCDRs to determine which measures would be appropriate for the MIPS following the issuance of the final rule with comment period, which is expected to be released in November 2016. Another commenter suggested QCDRs should be given until March 31 of the applicable performance period (that is March 31, 2017 for the 2019 MIPS payment adjustment) to submit this information.

Response: We thank the commenters for their feedback. We appreciate the concerns raised regarding the timelines for measure submission. We believe, however, that it is important that MIPS eligible clinicians can make their selection of measures prior to or at the onset of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

performance period to ensure they can build these measures into their quality workflow.

After consideration of the comments regarding the proposal on the QCDR measure specifications criteria we are finalizing the policies as proposed at §414.1400(f).

#### (6) Identifying Non-MIPS Quality Measures

To explain the definition of a non-MIPS quality measures for purposes of QCDRs submitting data for the MIPS quality performance category, we proposed at §414.1400(e) to consider the following types of quality measures to be non-MIPS quality measures:

- A measure that is not contained in the annual list of MIPS quality measures for the applicable performance period.
- A measure that may be in the annual list of MIPS quality measures but has substantive differences in the manner it is submitted by the QCDR. For example, if a MIPS quality measure is only reportable via the CMS Web Interface and a QCDR wishes to report this quality measure on behalf of its MIPS eligible clinicians, the quality measure would be considered a non-MIPS quality measure. This is because we would have only extracted the data collected from this quality measure using the CMS Web Interface, in which we utilize a claims-based assignment and sampling methodology to inform the groups on which patients they are to report, and the reporting of this quality measure would require changes to the way that the quality measure is calculated and reported to us via a QCDR instead of through the CMS Web Interface. Therefore, due to the substantive changes needed to report this quality measure via a QCDR, this CMS Web Interface quality measure would be considered a non-MIPS quality measure. CMS would not be able to directly compare MIPS eligible clinicians submitting the quality measure using the CMS Web Interface to those submitting the quality measure using the QCDR. Thus, this would be considered a non-MIPS quality measure.
- In addition, the CAHPS for MIPS survey currently could be submitted only using a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

CMS-approved survey vendor. Although the CAHPS for MIPS survey is proposed for inclusion in the MIPS measure set, we consider the changes that will need to be made available for reporting by individual MIPS eligible clinicians (and not as a part of a group) significant enough as to treat the CAHPS for MIPS survey as a non-MIPS quality measure for purposes of reporting the CAHPS for MIPS survey via a QCDR. To the extent that further clarification on the distinction between a MIPS and a non-MIPS measure is necessary, we will provide additional guidance on our Web site.

The following is a summary of the comments we received regarding identifying non-MIPS quality measures.

Comment: A few commenters requested that CMS increase the number of allowed non-MIPS measures to be well above 30, potentially incrementally on an annual basis. One commenter believed doing so would limit the flexibility that QCDRs need to support MIPS eligible clinician reporting, particularly for MIPS eligible clinicians that have few MIPS measures available to report. Another commenter strongly recommended that CMS increase the cap of 30 measures within any given QCDR because increasing the cap will allow multi-specialty groups comprised of diagnostic radiologists and interventional radiologists to report via the same QCDR.

Response: We appreciate the suggestion and will evaluate the feasibility of this request for future program years.

Comment: One commenter supported the proposal for non-MIPS quality measure specifications for QCDRs.

Response: We appreciate the support.

Comment: Some commenters stated they strongly recommend that QCDRs maintain the authority to make an initial determination about how best to classify each of their measures,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

including whether it falls into a high priority category.

Response: We will accept the QCDR's recommendation if the measure has been endorsed by NQF in a particular category. We reserve the right to not accept non-MIPS QCDR measures or the suggested category designated for the measure.

Comment: One commenter requested more transparency to the non-MIPS quality measure approval process. The commenter requested rather than going through a rigorous approval process, CMS should require each QCDR to have a transparent, clearly-defined process for developing and updating the data elements and quality measures utilized in their measures. The commenter believed these processes should include an opportunity for public input, timelines for review and approval of new measures or changes to existing measures, a peer-review process, and adequate patient protections and consent procedures. The commenter believed QCDRs should identify data collection methods, including opportunities to collect patient-reported outcomes, and risk-adjustment strategies. The commenter stated that CMS should not dictate how each QCDR registry implements the standards, as flexibility is needed to respond to the evolving standard of care and the rigors and challenges of collecting data. In addition, the commenter encouraged CMS to work to incorporate these recommendations through future rulemaking.

Response: We will take these suggestions into consideration in future rulemaking.

Comment: One commenter requested clarification on whether QCDRs can report non-MIPS measures using the XML format with, data extracted from an EHR electronically using applicable interoperability standards, and if these measures would meet CMS' proposed end-to-end electronic reporting requirement, to qualify for the electronic reporting bonus point.

Response: We would like to explain that QCDRs will be able to report non-MIPS measures using the CMS-specified data submission standard. More specific details, including

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the full technical specifications for submitting non-MIPS measures to CMS for the 2017 performance period, will be issued via subregulatory guidance

at [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram). We refer readers to the quality performance category scoring discussion in section II.E.6.a.(2) of this final rule with comment period for more details.

Comment: A few commenters noted that there are quality measures that do not require certification and sought clarity from CMS on their specific certification requirements. The commenters specifically questioned if a registry would need to be certified to §170.315(c)(1) through (3) to submit quality measures electronically or if the use of QRDA data structure requires certification. Some commenters recommended that the reporting mechanism requirements include discussion about third party intermediaries with incomplete measure certification and recommended that clinicians only be required to exhaust measures that are MIPS certified.

Response: While a registry, QCDR, or other third party intermediary is not required to certify to submit MIPS eCQMs or non-MIPS measures to meet the requirements to qualify for the electronic reporting bonus, a registry may obtain certification to the CQM related certification criteria at §170.315(c)(1) through (3) to support the accuracy and standardization of clinician reporting. Registries are encouraged to seek certification to §170.315 (c)(4) (clinical quality measures – filter) if their services include reporting measures results to CMS or providing performance feedback to their participants at various levels of aggregation, such as individual clinician, patient, group, or population. We note that certification for the §170.315(c) criteria is measure-specific and includes only those CQM for which eCQM specifications have been published by CMS; however, these measures may use value sets and specifications that overlap with MIPS eCQMs. A registry may submit a submit a MIPS eCQM using either health IT certified to import and calculate (§170.315 (c)(2)) and report (§170.315 (c)(3)) those MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures, or using an automated, verifiable software to process data, calculate and electronically report to the Quality Payment Program-accepted non-MIPS or registry measures consistent with CMS-vetted protocols. In either case, the registry's participating eligible clinicians would in turn need to record the clinical data for those CMS-published measures in their CEHRT and export to the registry in the required standard HQMF or QRDA using health IT certified to record and export (§170.315 (c)(1)).

The MIPS measures for which eCQM specifications are available can be readily identified by presence of a CMS e-Measure ID and by inclusion of "EHR" in the "Data Submission Method" column for that measure in the Appendix Table A: Individual Quality Measure Available for MIPS Reporting in 2017 of this final rule with comment period. Specifications and additional information relevant to submitting eCQMs to CMS are available at [QualityPaymentProgram.cms.gov](http://QualityPaymentProgram.cms.gov).

A QCDR that is submitting non-MIPS measures is not required to use HQMF or QRDA, and may choose to use an API or other relevant standards supported by its participants' health IT to achieve standards-based access to quality measurement data. Because the HQMF and QRDA standards are familiar to many health IT vendors and EHR vendors, a registry might choose to use one or both of these standards to implement non-MIPS measures. In this case, we would encourage the registry to use the development and testing tools available via the CMS-ONC eCQI Resource Center Web site (<https://ecqi.healthit.gov/>), to the extent applicable to their measure development and implementation approaches.

Comment: Other commenters recommended that QCDR measures, particularly those focused on the improvement activities performance category, should be used to satisfy some requirements for improvement activities since there are no MIPS measures which are relevant to many subspecialists. The commenters stated that QCDR measures are not among the 200

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures that CMS has identified as being able to contribute to the quality performance category reporting score. The commenters stated that it appears that if MIPS eligible clinicians use QCDR measures as one of the six required measures, the method of scoring will penalize MIPS eligible clinicians for using non-standard measures.

Response: The MACRA legislation requires four performance categories of the MIPS program. We cannot count the reporting of QCDR measures which would count in the quality performance category of the program to also count for the improvement activities performance category. If a MIPS eligible clinician uses a QCDR outcome measure as one of their six measures for the quality performance category, this would still count toward satisfying the reporting requirement. However, there are specific instances in which one improvement activity may be applicable to two performance categories. For example, the CAHPS for MIPS survey is included under the quality performance category, as well as the improvement activities performance category as a high weighted activity in the Beneficiary Engagement subcategory noted in Table H of the Appendix in this final rule with comment period. In addition, certain improvement activities may count for bonus points in the advancing care information performance category if the MIPS eligible clinician uses CEHRT. Reporting extra outcome or other high priority measures would still earn the MIPS eligible clinician bonus points, as discussed in section II.E.6.a.(2)(e) of this final rule with comment period. Regarding adding improvement activities to the improvement activities inventory for future years we refer readers to section II.E.5.f.(8)(b) of this final rule with comment period for the discussion on the annual call for activities.

Comment: One commenter recommended that as part of the call for quality measures, contributions be entered into a single pool of eCQM definitions that get reviewed to ensure the measure is able to be derived from CEHRT data and reported on using CEHRT. They noted that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the past practice of allowing various organizations to have different definitions, measure, and reporting formats has created unnecessary difficulty for clinicians and their CEHRT to effectively collect and report on the measure. The commenter further recommended that we arrive on a single definition for a measure for anybody to use with an interest in that measure and a single report format to make it easier to report to various organizations (CMS, registries, etc.) based on the same underlying data from the CEHRT. The commenter specifically recommended that eCQMs be that single definition for a measure and that the QRDA be the single report format.

Response: We thank the commenter for their suggestion. We refer the commenter to section II.E.5.c.(2) of this final rule with comment period for more detail on our requirements for the MIPS call for quality measures. We agree that there is value in trying to streamline the measure specification standards and data submission standards. We do not believe however that the eCQM measure specification standard, specifically the Health Quality Measure Format (HQMF) or that the QRDA data submission format can be that unified format for the transition year of MIPS. We will continue to evaluate this issue and address any changes in future notice and comment rulemaking.

After consideration of the comments regarding the proposal regarding identifying non-MIPS quality measures we are finalizing the policies as proposed at §414.1400(e).

(7) Collaboration of Entities to Become a QCDR:

In the CY 2016 PFS final rule (80 FR 71136 through 71138) we finalized our proposal to allow collaboration of entities to become a QCDR based on our experience with the qualifying entities wishing to become QCDRs for performance periods. We received feedback from organizations who expressed concern that the entity wishing to become a QCDR may not meet the criteria of a QCDR solely on its own. We believe this policy supporting entity collaboration

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

should be continued under MIPS. Therefore, we proposed at §414.1400 that an entity that may not meet the criteria of a QCDR solely on its own but could do so in conjunction with another entity, would be eligible for qualification through collaboration with another entity.

We proposed to allow that an entity that uses an external organization for purposes of data collection, calculation, or transmission may meet the definition of a QCDR provided the entity has a signed, written agreement that specifically details the relationship and responsibilities of the entity with the external organization effective as of September 1 the year prior to the year for which the entity seeks to become a QCDR (for example, September 1, 2016, to be eligible to participate for purposes of the 2017 performance period). Entities that have a mere verbal, non-written agreement to work together to become a QCDR by September 1 the year prior to the year for which the entity seeks to become a QCDR would not fulfill this proposed requirement. We requested comments on these proposals.

The following is a summary of the comments we received regarding collaboration of entities to become a QCDR.

Comment: Some commenters recommended the deadline for a written agreement between entities collaborating to become a QCDR be November 1 rather than September 1 to align with the November 1 deadline to self-nominate.

Response: We require this element to be completed at the beginning of the self-nomination period to enable and encourage QCDRs to self-nominate as early as possible.

Comment: Some commenters were not in favor of allowing entities that do not meet the QCDR criteria to collaborate with external organizations to qualify as QCDRs. The commenters were concerned that the language of this provision is so broad that it would allow health IT vendors and other commercial entities to become QCDRs without any participation of MIPS eligible clinician-led professional organizations that are focused on quality improvement relating

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to specific medical procedures, conditions, or diseases. The commenters believed language should be clarified to state that QCDRs that involve multiple organizations must be led and controlled by MIPS eligible clinician-led professional organizations or similar entities that are focused on quality improvement relating to particular types of medical procedures, conditions, or diseases.

Response: Many specialty societies including subspecialty groups may not have the resources to develop the software platform needed to be a QCDR and thus partner with outside entities to support their QCDR. We believe that prohibiting specialty groups from partnering with outside entities would only serve to harm smaller societies and possibly prevent their participation in MIPS or at least limit their ability to measure and report data meaningful to their practice.

After consideration of the comments received on the collaboration of entities to become a QCDR we are finalizing the policies as proposed. Specifically, we are finalizing at §414.1400 that an entity that may not meet the criteria of a QCDR solely on its own but could do so in conjunction with another entity, would be eligible for qualification through collaboration with another entity.

#### b. Health IT Vendors and Other Third Parties That Obtain Data from MIPS Eligible Clinician's CEHRT

Currently, clinicians seeking to meet CMS quality program technology requirements must use EHR technology that is certified and meets the CEHRT definition established under the EHR Incentive Programs at 42 CFR 495.4. The Office of the National Coordinator for Health Information Technology (ONC) health IT certification program has established standards and other criteria for structured data that EHRs must use in order to be successfully tested and certified. We proposed to maintain this standard and require EHR-based data submission

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(whether transmitted directly from the EHR or from a data intermediary) to be CEHRT to submit quality measures, advancing care information, and improvement activities data for MIPS. In addition, we proposed at §414.1400(a)(4) that health IT vendors that obtain data from a MIPS eligible clinician's CEHRT, like other third party intermediaries, would have to meet all criteria designated by us as a condition of their qualification or approval to participate in MIPS as a third party intermediary. This includes submitting data in the form and manner specified by us as proposed at §414.1400(a)(4)(ii). We anticipate that for the initial years of MIPS the form and manner requirements would be similar to what was used in the PQRS program. However, at a minimum these will be modified to address the four performance categories under MIPS and MIPS data calculation needs. As we gain experience under MIPS we anticipate that these form and manner requirements may change in future years to ease reporting burden. Historical form and manner requirements under the PQRS program are available at <https://www.qualitynet.org/imageserver/pqrs/registry2015/index.htm> or [https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Downloads/QRDA\\_2016\\_CMS\\_IG.pdf](https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Downloads/QRDA_2016_CMS_IG.pdf). In addition, health IT vendors must comply with our QRDA Implementation Guides if submitting data from a CEHRT, which we anticipate will be similar to the one noted above. We anticipate providing further subregulatory guidance that would identify the CEHRT data formats that clinicians must submit. In addition, we proposed at §414.1325(b)(2) and (c)(2) to allow individual MIPS eligible clinicians and groups to submit data using CEHRT for the quality, improvement activities, or advancing care information performance categories.

Although section 1848(q)(5)(B)(ii)(I) of the Act specifically requires the Secretary to encourage MIPS eligible clinicians to report on applicable measures using EHR technology with respect to the quality performance category, the statute does not specifically address allowing a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

third party intermediary— such as a health IT vendor -- to submit on a MIPS eligible clinician's behalf for the other performance categories. Although we could limit the usage of health IT vendors assessing the quality performance category under MIPS, we believe it would be less burdensome for MIPS eligible clinicians if we expand the health IT vendors' capabilities. By allowing health IT vendors to report on the quality, advancing care information, and improvement activities performance categories we would alleviate the need for individual MIPS eligible clinicians and groups to use a separate mechanism to report data for these performance categories. Our intention is to encourage health IT vendors to design systems that are able to support new types of EHR reporting (for example, improvement activities and advancing care information) from MIPS eligible clinicians and groups – this would be in addition to the quality measure data that we already can accept. Therefore, we proposed at §414.1400(a)(2) to expand health IT vendors' capabilities by allowing health IT vendors to submit data on measures, activities, or objectives for any of the following MIPS performance categories:

- Quality;
- Improvement activities; or
- Advancing care information.

As proposed at §414.1400(a)(1), health IT vendors submitting data on behalf of a MIPS eligible clinician or group would be required to obtain data from the MIPS eligible clinician's CEHRT. We believe this approach would permit a single health IT vendor to report on quality, advancing care information, and improvement activities performance category requirements for MIPS on behalf of multiple eligible clinicians or groups and should mitigate the risks, costs, and burden of MIPS eligible clinicians having to report multiple times to meet the requirements of MIPS.

Health IT Vendors Data Criteria:

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We further proposed that health IT vendors must be able to do the following:

- For measures, activities, and objectives under the quality, advancing care information, and improvement activities performance categories, and as proposed at §414.1400(a)(4)(i); if the data is derived from CEHRT, the health IT vendor must be able to indicate this data source.

- Either transmit data from the certified EHR technology or through a data intermediary in the CMS-specified form and manner, or have the ability for the individual MIPS eligible clinician and group to be able to submit data directly from their CEHRT, in the CMS-specified form and manner.

For MIPS eligible clinicians who choose to electronically submit quality, advancing care information, and improvement activities data extracted from their CEHRT to an intermediary, the intermediary would then submit the measure and activity data to us in a CMS-specified form and manner on the MIPS eligible clinician's behalf for the respective performance period. In addition to meeting the appropriate data submission criteria for the quality, advancing care information, and improvement activities performance categories for the MIPS EHR submission mechanism, MIPS eligible clinicians who choose the EHR submission mechanism would be required to have CEHRT meeting the proposed definition at §414.1305. We requested comments on these proposals.

The following is a summary of the comments we received regarding health IT vendors and other third parties that obtain data from an eligible clinician's CEHRT, referred to throughout this section as "health IT vendors."

Comment: Some commenters disagreed with the following health IT vendors' data criterion: Either transmit data from the CEHRT or through a data intermediary in the CMS-specified form and manner, or have the ability for the individual MIPS eligible clinician and group to be able to submit data directly from their CEHRT, in the CMS-specified form and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

manner. The commenters stated that they believed this requirement would be an intrusion on the privacy of their patients.

Response: The standards for submission for MIPS do not vary significantly from the existing standards and privacy protections in place for programs such as PQRS, and the EHR Incentive Programs. We intend to maintain these important privacy protections for patients in any new system designed for MIPS reporting. However, we would like to explain that the policy outlined here is only a requirement for health IT vendors or other authorized third parties submitting data on behalf of an MIPS eligible clinician or group for participation in MIPS. In order to do such a submission, the health IT vendor or third party must meet the form and manner requirements which include privacy and security standards. Additional details will be provided on the Quality Payment Program data submission standard at [QualityPaymentProgram.cms.gov](https://www.cms.gov/QualityPaymentProgram).

Comment: A few commenters recommended making a requirement for health IT vendors to build and maintain products that meet federal specifications rather than forcing MIPS eligible clinicians to purchase and constantly upgrade expensive often-bulky systems. Another commenter encouraged standards developers to introduce accelerated cycle times for updating standards, especially new and modified standards required to support automation of quality reporting along with incorporating a degree of flexibility to accommodate the needs of a rapidly changing health IT landscape.

Response: We thank the commenters for their feedback and note that our intent is to align the adoption of the key health IT standards across CMS quality reporting programs. That is to say, the standards we adopted for the use of certified health IT are industry standards which are first reviewed, analyzed, and adopted by the Secretary and are a part of ONC's Health IT Certification Program. These standards include key language for capturing structured data and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

document formats which are used by CMS programs and within the wider health care arena. In order to accommodate new standards and modifications as they arise, ONC periodically releases a new Edition of certification criteria which includes important updates as well as new functions to support clinicians leveraging health IT for patient care. CMS maintains a definition of CEHRT which requires clinicians to transition to new Editions over time in a consistent manner across our programs referencing certified health IT. These updates are essential to ensuring clinicians are using standards with high efficacy, accuracy, and the appropriate patient safety and security protocols.

We established the definition of CEHRT to set the federal specifications for clinicians using certified health IT within our programs. For a certified health IT product or products to meet the CEHRT definition they must include Health IT Modules which are certified to certification criteria under the ONC Health IT Certification Program and are related to certain CMS program reporting. These include the ability to calculate the advancing care information measures, as well as the ability to accurately capture and export CMS eCQMs. Further, the CEHRT definition includes functions which reference a wide range of file transport standards including the CCDA and QRDA formats as well as the API functionality. CMS and ONC then work together to further develop and publish specifications for health IT vendors which meet the form and manner requirements for reporting to our programs. For the Quality Payment Program, CMS and ONC will work to ensure that similar processes and testing of specifications is completed to support accurate and efficient CEHRT-based reporting for program participants. Additional details will be provided on the Quality Payment Program data submission standard at [QualityPaymentProgram.cms.gov](http://QualityPaymentProgram.cms.gov). For further information on the CEHRT definition adopted for the Quality Payment Program at §414.1305, we direct readers to section II.E.5.g. of this final rule with comment period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: A few commenters believed that based on the proposal, it is difficult to determine if health IT vendors and third party data submission vendors are held to the same standards. The commenters requested that health IT vendors be held to the same criteria as QCDRs under MIPS. This includes providing regular feedback to participants and explaining methodologies. The commenters were concerned that the proposal was too broad and that health IT vendors and other entities could become QCDRs without MIPS eligible clinician-led professional organization participation. Several commenters requested that CMS reduce or eliminate the criteria related for third party intermediaries.

Response: Health IT vendors and QCDRs are distinct submission mechanisms that have differing requirements and capabilities under MIPS. Generally, QCDRs which are engaged in quality measurement activities are held to standards related to these services. Health IT vendors provide services related to the development, implementation, and support of health IT systems. Some health IT vendors offer data submission services to CMS programs as a part of their support of health IT services. Other health IT vendors maintain a range of data transmission, aggregation, and calculation services or functions separate from the EHR immediately installed in the practice location, for example those operating a cloud-based system. Still other health IT vendors offer certified health IT products which allow a health care provider to autonomously manage their EHR system and electronically extract or export and report data to CMS programs directly from their CEHRT using functions which meet CMS form and manner requirements. Still other scenarios and potential options related to other authorized third parties not involved in the direct provision of EHR systems may be available to support MIPS participation. For example, some HIE organizations are exploring the option of supporting provider data submission by establishing partnerships with health IT vendors to submit data on behalf of their customers. The policies noted in this section which apply to health IT vendors apply to other

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

authorized third parties and across each of these circumstances and other potential related scenarios. In this section of the final rule with comment period, we are explaining only that health IT vendors are accountable to ensure that their products and services meet the form and manner required regardless of which scenario or submission method is applicable when submitting on behalf of a MIPS eligible clinician or group.

We note that form and manner requirements for the submission are related to the requirements defined for the measures and activities in each performance category within this final rule with comment period. Therefore, we note that while there is no specific standard or certification requirement for a health IT vendor or other authorized third party submitting data on behalf of an eligible clinician or group beyond the form and manner specifications for the submission mechanism, the eligible clinician or group must still meet the category or measure specific requirements. For example, within the quality performance category there are different requirements for CQMs which must be met depending on the measures an MIPS eligible clinician or group chooses to report, and the form and manner must be used for the submission mechanism appropriate for reporting those selected measures. This is consistent with prior CMS policy for PQRS and the EHR Incentive Programs, and is reflected in the CEHRT definition for the quality payment programs at §414.1305 for MIPS eligible clinicians or groups supported by these services. For example, the CQM submission requirement within that CEHRT definition states at paragraph (1)(ii)(B)(3) that a CQM submission meets certain certification criteria and can be electronically accepted by CMS if the data is submitted electronically. We reiterate that there are no certification criteria associated with measurement for the improvement activities performance category. For further information on how the CEHRT definition applies for MIPS eligible clinicians and groups under the quality performance category, we direct readers to the end-to-end electronic reporting bonus in section II.E.6. of this final rule with comment period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

For further information on how the use of CEHRT is applicable for MIPS eligible clinicians and groups for the advancing care information performance category, we direct readers to section II.E.5.g. of this final rule with comment period. Finally, for information on how the use of CEHRT is applicable for APM Entities, we direct readers to section II.F.4.b. of this final rule with comment period.

We appreciate the commenter's concern however on health IT vendors becoming a QCDR without the sponsorship or governance of a professional organization and would like to refer the commenter above to section II.E.9.a.(7) of this final rule with comment period, where we discuss the requirements of allowable partnerships between IT vendors and specialty organizations. We further disagree with setting no requirements for any third party intermediary as these policies ensure both that the MIPS eligible clinician is provided appropriate supports and protections and that CMS is able to accept and use the data submitted on their behalf.

Comment: A few commenters stated the qualification requirements for companies in the general health IT vendor category (in contrast to requirements for PQRS submitters) are unclear. Many commenters requested CMS clarify what constituted a submission method that would need to be certified and requested clarification and additional details regarding what third party submission must do regarding submitting data for all performance categories. While some believed that EHR vendors can add improvement activities criteria into their systems fairly easily. Other commenters stated there is no current certification for improvement activities data and it is unclear how a MIPS eligible clinician could use CEHRT to submit improvement activities data without criteria for how to record or transmit such data. Some commenters requested an interim rule defining the specific requirements to become certified for MIPS data submission.

Some commenters agreed with the health IT vendor criteria at §414.1400(a)(2).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

However, the commenters were concerned about the ability of health IT vendors to incorporate mechanisms for reporting the new advancing care information and improvement activities performance categories into QRDA's under the current reporting deadlines and without new implementation guides. Second, commenters noted that the most recent draft of the HL7 Quality Reporting Document Architecture (QRDA) had not incorporated these new performance categories as of the publication of the MIPS proposed rule and noted that this would be essential for facilitating vendor efforts to make software modifications. Third, once the QRDA is updated to accommodate the MIPS, it will be important for CMS to test and validate the reporting standards related to the inclusion of these new performance categories.

Response: In our proposal, we stated our intent to encourage health IT vendors to design systems that are able to accept new types of EHR data (for example, improvement activities and advancing care information performance categories) from MIPS eligible clinicians and groups – would be in addition to the quality measure data that we already can accept directly through electronic reporting from CEHRT. Therefore, we proposed at §414.1400(a)(2) to expand health IT vendors' capabilities by allowing health IT vendors to submit data on measures, activities, or objectives for the quality, improvement activities, or advancing care information performance categories. We also proposed to require that EHR-based data submission (whether transmitted directly from the EHR or from a data intermediary) meet the CEHRT definition before it can submit quality measures, advancing care information, and improvement activities performance category data for MIPS. However, as noted in public comments, no certification criteria currently exists which is specific to the improvement activities performance category of MIPS and while there are criteria required for the calculation of measures within the advancing care information performance category, there is not a submission format certification requirement. We do not intend to add new burden on developers who are already working toward certification

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to the 2015 Edition certification criteria, nor do we intend to require MIPS eligible clinicians to obtain new certified Health IT Modules beyond the current CEHRT definition. For these reasons, we are finalizing a modified version of our proposal to require use of CEHRT for EHR-based data submission purposes for the 2017 performance period. We will continue to require the use of CEHRT for those items that the MIPS eligible clinician or group is reporting where that criterion is part of the current CEHRT definition for the 2014 Edition and 2015 Edition certification criteria for CY 2017 and the 2015 Edition only for CY 2018 and subsequent years, as defined for the Quality Payment Program at §414.1305. For instance, CEHRT may be required when submitting CMS eQMs for which certification criteria exist for use depending on the selected submission mechanism (see section II.E.6. of this final rule with comment period for further details on end-to-end electronic reporting). The CEHRT definition also includes certification criteria for calculating advancing care information performance category objectives and measures included in the certification criteria (see section II.E.5.g. of this final rule with comment period for further details on the advancing care information performance category objectives and measures). We direct readers to section II.E.5.g. of this final rule with comment period for further discussion of the CEHRT definition adopted for the Quality Payment Program at §414.1305.

However, we do agree with the commenters who note that the inclusion of improvement activities performance category reporting should be allowed for health IT vendors and we intend to allow MIPS eligible clinicians and groups the option to submit improvement activities performance category data in a manner similar to current reporting. In this way, we maintain our intent to encourage health IT vendors to design systems to be able to accept and support new types of data reporting within EHR systems. We further note that for MIPS, we are maintaining the requirement that submissions be reported in the form and manner specified by CMS. That

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

form and manner will be specified by CMS for each available submission method through subregulatory guidance consistent with prior CMS quality reporting programs.

We appreciate the commenter's feedback regarding the use of the QRDA and note that in prior years the CMS Implementation Guide (IG) included updated specifications for the QRDA that are similar to the types of updates that could potentially be included for reporting on advancing care information and improvement activities performance categories in MIPS. We do, however, understand and acknowledge the commenters concern on the timing of development to the IG as well as the need for adequate time for development, testing, and verification of any future updates to the QRDA Implementation Guide. We note that we will provide additional details related to the Quality Payment Program data submission standard at [QualityPaymentProgram.cms.gov](https://QualityPaymentProgram.cms.gov). We will continue to engage the vendor community as we implement MIPS in order to ensure that developers are aware of applicable criteria pertaining to the advancing care information, quality, and improvement activities performance categories and to obtain feedback and input on potential timing and development requirements to support reporting. We refer reader to section II.E.5.g. of this final rule with comment period for further discussion on CEHRT in the MIPS program.

Comment: Some commenters recommended CMS collaborate more with health IT vendors. The commenters acknowledged that groups have a very difficult time finding a vendor that knows the requirements and can assist the groups. Other commenters stated they are concerned that allowing the health IT vendors use intermediaries to submit data to CMS would result in cost, waste, and risk of security breaches.

Response: We thank the commenters for their suggestions and note that we will continue to engage the vendor and health IT vendor community as we implement MIPS. We appreciate the commenters expressing the concern and recognize that health IT vendors provide varying

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

types of functions. We encourage MIPS eligible clinicians and groups to review the types of functions and services health IT vendors would be able to provide before selecting a health IT vendor in order to ensure that needs of the MIPS eligible clinician or group would be able to be met. For MIPS eligible clinicians, groups, or the supporting health IT vendors that do not have the functionality to submit data to CMS, the use of intermediaries may be necessary and beneficial. However, we note that any entity providing submission services on behalf of an MIPS eligible clinician or group must be authorized by the MIPS eligible clinician or group as a surrogate or proxy to submit data to CMS on their behalf. In addition, when an MIPS eligible clinician (a HIPAA covered entity) or health IT vendor (a HIPAA business associate) shares ePHI with an intermediary (another business associate) to perform a function for the covered entity all these entities must comply and abide by the HIPAA Privacy, Security, and Breach Notification Rules and all CMS policies pertaining to privacy and security.

Comment: Some commenters were concerned that they believed CMS was moving away from the use of ONC-certified health IT products for calculating measures and requested that CMS work with ONC to clarify in the final rule with comment period what the expectations/requirements are for third party calculation and submission. The commenters noted that it was unclear if a third party submitting on behalf of an MIPS eligible clinician or group will be receiving raw data from CEHRT and would be required to calculate numerators and denominators, or if they would be receiving already calculated data from CEHRT where the third party intermediary could pass the already calculated data electronically to CMS.

Response: First, our goal is to encourage flexibility for the MIPS eligible clinician and the health IT vendors that support the MIPS eligible clinician. We, therefore, note that either scenario described where the third party performs calculations or where that third party submits already calculated data, would be acceptable for MIPS eligible clinicians and groups reporting to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS. We note that in either case, the third party would not be required to also be separately certified; however, the third party may test the calculations or certify to the calculations if there is an applicable certification criterion defined in the CEHRT definition for the Quality Payment Program at §414.1305. While testing and certification is optional, we do strongly encourage this action to support accurate measurement where certification is available for the measure. In either case, the data must be appropriately electronically exported or extracted from the MIPS eligible clinicians' CEHRT. This means that if the MIPS eligible clinician is performing an export of raw data, the appropriate CEHRT function must be used if applicable for that data transmission, and if the MIPS eligible clinician is calculating and then exporting the data, the appropriate CEHRT function must be used if applicable for that calculation and data transmission. We refer readers to section II.E.5.g. of this final rule with comment period for further information specific to the capture, calculation, and submission of CQMs related to the end-to-end electronic reporting bonus within the quality performance category.

We note that it is not our intent to move away from the use of certified health IT for calculating measures, but rather our intent is to recognize and accommodate the variability among MIPS eligible clinicians in technology use and adoption. Through these policies, we are seeking to reduce the burden and remove entry barriers to participation where possible for those MIPS eligible clinicians who may be engaging with CEHRT, meaningful use, quality measurement, and improvement activities for the first time as an individual MIPS eligible clinician or group. By allowing for greater flexibility in the first few years of the program, we are establishing a guide path to move toward expanded adoption, implementation, use, and innovation of certified health IT. In this way, we are allowing for adequate time for MIPS eligible clinicians, health IT vendors, and other third party entities like QCDRs to develop, test, implement, and monitor health IT systems designed to support participation in MIPS. However,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

where relevant standards have been established as part of the certification program, we believe that applying these standards will support more reliable, accurate quality measurement, and we will work with Quality Payment Program participants and the health IT vendor community to continue to expand the availability and applicability of these tools. Finally, we are maintaining our focus on electronic reporting that is standards-based. We also believe this approach encourages increased adoption and use within the health care industry of advanced health IT amongst MIPS eligible clinicians and APM entities. We intend to publish specific standards that third party intermediaries will need to follow for data submission through subregulatory guidance and will work with health IT vendors to develop, test, and verify that guidance for MIPS data submission.

Comment: A few commenters sought clarification on the statement that EHR-based systems are required to be certified for multiple programs. Other commenters stated that beyond what is already required for CEHRT certification, they did not believe that CMS should force third party intermediaries to implement reporting capabilities that may be outside of their organizational and client priorities.

Response: First, the CEHRT definition is what MIPS eligible clinicians and groups must use to meet certain requirements of MIPS related to the use of certified health IT. The CEHRT definition is not applicable to a QCDR, registry, or other third party providing health IT support services to an MIPS eligible clinician or group, although these groups may choose to develop or adopt certain elements of certified health IT in order to support reliable standards based measurement where relevant certification criteria exist.

Second, there are not separate CEHRT requirements for separate CMS programs which reference CEHRT. The ONC-established certification criteria which are included in the CEHRT definition for the Quality Payment Program at §414.1305 and required for MIPS are not specific

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to a single component of CMS programs. Instead, ONC certifies individual Health IT Modules to perform specific functions using specific standards and implementation specifications that are part of the ONC Editions of certification criteria which are required only for those health IT vendors which are seeking to have their health IT certified. CMS then defines a package or collection of those certified Health IT Modules which an MIPS eligible clinician or group must possess to meet the CMS definition of CEHRT. The definition of CEHRT is currently substantively the same for MIPS, the EHR Incentive Programs, and Advanced Alternate Payment Models. This means that if an MIPS eligible clinician has an EHR system that meets the CEHRT definition, that system can support participation in each program (MIPS, EHR Incentive Program or AAPM) for which that clinician is eligible. The MIPS eligible clinician, or a health IT vendor submitting on their behalf, can report using data from that CEHRT for any such program without any additional certification as long as the submission meets the form and manner requirements established by CMS.

Finally, there are multiple data submission methods available to MIPS eligible clinicians and groups. These multiple paths for reporting are designed to allow for flexibility to select the method most relevant for their practice, processes, and available features. For each of these submission methods, any submission on behalf of an MIPS eligible clinician or group must meet the form and manner requirements for data submission to us for that method. We understand a third party may offer a wide range of services to an MIPS eligible clinician or group beyond data submission to us. However, if that third party is offering data submission services for MIPS eligible clinicians, they must meet the form and manner specifications related to the chosen submission method. It is essential to maintain form and manner requirements specific to each of those methods in order to ensure the data can be accurately received, validated, and used to establish the appropriate payment adjustment for the performance period. We believe the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

flexibility of multiple paths will help to minimize burden on MIPS eligible clinicians, groups, and authorized third party intermediaries submitting on their behalf.

Comment: Some commenters believed that since the final list of quality measures will not be published until the end of the year, it will be impossible to make any EHR configuration changes that may be necessary for the reporting of the measures. In addition, a few commenters noted that EHR vendors will not have sufficient time to develop dashboards for tracking quality and advancing care information performance in MIPS before January 1, 2017. The commenters believed that EHR vendors will have to develop measurement logic for tracking and reporting group reporting of advancing care information before March 1, 2018 and several improvement activities rely on the use of EHRs may also create a need for system changes.

Response: We recognize and can appreciate the concerns raised by the commenters. We have instituted numerous flexibilities in the transition year of MIPS to account for additional time needed for development and implementation. In addition, CMS and ONC will work together with health IT vendors on development, testing, and verification pathways for measure calculation and group reporting to support MIPS data reporting.

Comment: Some commenters were concerned about the complexity of how CEHRT interacts with other products and registries and what capabilities should be certified. Other commenters recommended that new ONC EHR certifying criteria require meaningful data flow into registries and QCDRs, and that formats be amenable for the CMS Web Interface to reduce data burden. One commenter requested ongoing adoption of data interoperability standards for clinical data registry so they become interoperable with structured EHR clinical data.

Response: At present, the definition of CEHRT established by CMS for MIPS at §414.1305 aligns with ONC certification criteria and includes requirements for a range of document formats which could be leveraged to engage with third parties such as registries, HIE

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

organizations, and even with other health care providers who may not yet have access to certified health IT. In this way, technology that meets the definition of CEHRT supports the interoperable electronic exchange of data among varied settings across multiple platforms. CMS and ONC are working together to continue to advance the health IT infrastructure and support interoperability.

We recognize that in the present environment, not all data received and used by qualified registries is derived from EHRs and readiness for certified health IT adoption among QCDRs varies greatly within the industry. While we agree that electronic transmission of the data elements needed to calculate quality measures would reduce burden on MIPS eligible clinicians and be potentially beneficial, we do not think it is appropriate for qualified registries to be required at this time to adopt a potentially costly change to their data collection model without adequate time to plan, test, implement, and ensure the efficacy of any such transition. We will continue to review and analyze readiness and engage with stakeholders to consider future development and needs.

After consideration of the comments regarding health IT vendors that obtain data from MIPS eligible clinician's CEHRT, we are finalizing that the MIPS eligible clinicians who choose the EHR submission mechanism would be required to have certified EHR technology meeting the CEHRT definition for the quality payment program at §414.1305 as proposed. In addition, we are finalizing the proposed policies for submission with modifications as follows.

We are not finalizing a requirement for any certification criteria related to the submission of data beyond those which are currently defined within the CEHRT definition for the quality payment programs at §414.1305.

In addition, we are further noting that the requirements within the CEHRT definition apply to the MIPS eligible clinician or group, not to the health IT vendor or other third party intermediary supporting that MIPS eligible clinician with data submission. We are finalizing at

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

§414.1325(b)(2) and (c)(2) to allow MIPS eligible clinicians and groups to submit data for the improvement activities performance category, and data exported or extracted from CEHRT for the quality and advancing care information performance categories, either directly to CMS or with the support of a third party intermediary such as a health IT vendor or other authorized third party.

Additionally, we are finalizing modifications to our proposal at §414.1400(a)(2) and §414.1400(a)(1) that a health IT vendor or other authorized third party intermediary may submit data for the improvement activities performance category, and data exported or extracted from CEHRT for the quality and advancing care information performance categories, on behalf of an MIPS eligible clinician or group.

We are finalizing at §414.1400(a)(4) that health IT vendors and other authorized third party intermediaries that obtain data exported or extracted from a MIPS eligible clinician's CEHRT would have to meet all criteria designated by us as a condition of their qualification or approval to participate in MIPS as a third party intermediary. As noted, this would include authorization by the MIPS eligible clinician or group to submit on their behalf and also includes submitting data in the form and manner specified at §414.1400(a)(4)(ii).

Finally, we are finalizing a modification to the proposed policy regarding the requirements for health IT vendors to state that health IT vendors or other authorized third party intermediary that are submitting on behalf of an MIPS eligible clinician or group must be able to do the following to submit MIPS data to us:

- For measures, activities, and objectives under the quality, advancing care information, and improvement activities performance categories, and as proposed at §414.1400(a)(4)(i); if the data is exported or extracted from certified EHR technology, the health IT vendor or third party must be able to indicate this data source; and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Transmit the data electronically exported or extracted from the CEHRT to us directly or through a data intermediary in the CMS-specified form and manner.

### c. Qualified Registries

We proposed to define a qualified registry at §414.1305 as a medical registry, a maintenance of certification program operated by a specialty body of the American Board of Medical Specialties or other data intermediary that, with respect to a particular performance period, has self-nominated and successfully completed a vetting process (as specified by CMS) to demonstrate its compliance with the MIPS qualification criteria specified by CMS for that performance period. The registry must have the requisite legal authority to submit MIPS data (as specified by CMS) on behalf of a MIPS eligible clinician or group to CMS. In addition, we proposed at §414.1400(a)(2) to expand a qualified registry's capabilities by allowing qualified registries to submit data on measures, activities, or objectives for any of the following MIPS performance categories:

- Quality;
- Improvement Activities; or
- Advancing care information, if the MIPS eligible clinician or group is using certified

EHR technology.

The following is a summary of the comments we received regarding the proposed qualified registry definition and expanded capabilities proposal.

Comment: Some commenters agreed with the proposed definition of a qualified registry.

Response: We appreciate the commenters support.

Comment: Several commenters agreed with the proposal to allow third party intermediaries, such as qualified registries, to submit data for the performance categories of quality, advancing care information, and improvement activities. The commenters believed

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

allowing MIPS eligible clinicians to use a single, third party submission method reduces the administrative burden on MIPS eligible clinicians, facilitates consolidation, and standardization of data from disparate EHRs and other systems, and enables the third parties to provide timely, actionable feedback to MIPS eligible clinicians on opportunities for improvement in quality and value.

Response: We thank the commenters for their support.

Comment: A few commenters did not support the criteria that qualified registries must have the capability to submit for all performance categories. The commenters believed that while this could reduce burden for MIPS eligible clinicians, choosing to support one or more performance categories is a business decision and should not be regulated. In addition, the commenters stated this would limit the MIPS eligible clinician's choice in the early years of MIPS, as not all third party entities would necessarily be able to meet the criteria for submittal for all three performance categories.

Response: While we do encourage qualified registries to be able to support for all performance categories we do not require that all MIPS performance categories be reported by a qualified registry. Rather we require that a qualified registry be able to report the quality performance category and note that it is the registry's choice to be qualified to the advancing care information and improvement activities performance categories.

After consideration of the comments on the qualified registry policies above we are finalizing the policies at §414.1305 and §414.1400(a)(2) as proposed.

#### (1) Establishment of an Entity Seeking to Qualify as a Registry

We proposed at §414.1400(h) that in order for an entity to become qualified for a given performance period as a qualified registry, the entity must be in existence as of January 1 of the performance period for which the entity seeks to become a qualified registry (for example,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

January 1, 2017, to be eligible to participate for purposes of performance periods beginning in 2017). The qualified registry must have at least 25 participants by January 1 of the performance period. These participants do not necessarily need to be using the qualified registry to report MIPS data to us; rather, they need to be submitting data to the qualified registry for quality improvement. We also proposed a qualified registry must provide attestation statements from the qualified registry/MIPS eligible clinicians during the data submission period that all of the data (quality measures, improvement activities, and advancing care information measures and objectives, if applicable) and results are accurate and complete.

The following is a summary of the comments we received regarding our proposal for the establishment of an entity seeking to qualify as a registry.

Comment: A few commenters expressed concern for the proposed 25-participant minimum for qualified registries for an entity to become qualified for a given performance period as the commenters believed the criteria were arbitrary. Further, the commenters stated that participants should be required to be in place on January 1 as they did not believe registries would have the potential to pull historical data from the performance period.

Response: As the MIPS program relies on the ability of CMS to receive accurate data for MIPS eligible clinicians, we believe it is important to approve established entities who have demonstrated their ability to collect and calculate data. We require a 25 participant minimum for entities to self-nominate as a qualified registry because we have found in past programs that 25 participants is an adequate number of participants that will prevent small clinical practices from attempting to be their own registry. We are concerned that potentially smaller practices may not have the IT expertise to report their data and there is no intermediary to validate the submitted data. Additionally, having existing registry members will help to ensure that the entity has at least some experience collecting and calculating quality measure data.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

After consideration of the comments received regarding our proposal for the establishment of an entity seeking to qualify as a registry, we are finalizing the policies at §414.1400(h) as proposed.

## (2) Self-Nomination Period

For the 2017 performance period, we proposed at §414.1400(g) a self-nomination period from November 15, 2016 until January 15, 2017. For future years of the program, starting with the 2018 performance period, we proposed to establish the self-nomination period from September 1 of the prior year until November 1 of the year in which the qualified registry seeks to be qualified. Entities that desire to qualify as a qualified registry for purposes of MIPS for a given performance period would need to provide all requested information to us at the time of self-nomination and would need to self-nominate for that performance period. Having qualified as a qualified registry does not automatically qualify the entity to participate in subsequent MIPS performance periods. For example, a qualified registry may choose not to continue participation in the program in future years, OR the qualified registry may be precluded from participation in a future year, due to multiple data or submission errors as noted below. As such, we believe an annual self-nomination process is the best process to ensure accurate information is conveyed to MIPS eligible clinicians and accurate data is submitted to MIPS.

We proposed to require further information of qualified registries at the time of self-nomination. All self-nomination information must be submitted to MIPS\_SelfNominations@cms.hhs.gov. If technically feasible we will accept self-nomination information via a web-based tool; we will provide any further information on the web-based tool at QualityPaymentProgram.cms.gov. If an entity becomes qualified as a qualified registry, they would need to sign a statement confirming this information is correct prior to us listing their qualifications on their Web site. Once we post the qualified registry on our Web site, including

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the services offered by the qualified registry, we would require the qualified registry to support these services/measures for its clients as a condition of the entity's qualification as a qualified registry for purposes of MIPS. Failure to do so will preclude the qualified registry from participation in MIPS in the subsequent performance year.

We did not receive any comments regarding our proposals for the qualified registry self-nomination period. Therefore, we are finalizing the policies at §414.1400(g) as proposed.

### (3) Information Required at the Time of Self-Nomination:

We proposed that a qualified registry must provide the following information to us at the time of self-nomination:

- Organization Name (Specify Sponsoring Organization name and software vendor name if the two are different. For example, a specialty society in collaboration with a software vendor).

- MIPS performance categories (that is, categories for which the entity is self-nominating to report. For example, quality measures, advancing care information, or improvement activities).

- Performance Period.

- Vendor Type (for example, qualified registry).

- Provide the method(s) by which the entity obtains data from its customers for each performance category for which it is approved: claims; web-based tool; practice management system; CEHRT; other (please explain). If a combination of methods (Claims, web-based tool, Practice Management System, CEHRT, or other) is utilized, please state which method(s) the entity utilizes to collect data (performance numerator and denominator).

- Indicate the method the entity will use to verify the accuracy of each TIN/NPI and/or TIN it is intending to submit (for example; National Plan and Provider Enumeration System

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(NPPEs), CMS claims, tax documentation).

- Describe the method the entity will use to accurately calculate performance rates for quality measures based on the appropriate measure type and specification. For composite measures or measures with multiple performance rates, the entity must provide us with the methodology the entity uses to calculate these composite measures and measures with multiple performance rates. The entity should be able to report to us a calculated composite measure rate, if applicable.

- Describe the method that the entity will use to accurately calculate performance data for improvement activities and advancing care information performance categories based on the appropriate parameters or activities.

- Describe the process that the entity will use for completion of a randomized audit of a subset of data prior to the submission to us (for all performance categories the qualified registry is submitting data on; that is, quality, improvement activities, and advancing care information, as applicable). Periodic examinations may be completed to compare patient record data with submitted data or ensure MIPS quality measures or other performance category (improvement activities and advancing care information) activities, measures, or objectives were accurately reported and performance calculated based on the appropriate measure specifications (that is, accuracy of numerator, denominator, and exclusion criteria) or performance category criteria.

- Provide information on the entity's process for data validation for both individual MIPS eligible clinicians and groups within a data validation plan. For example, for individuals, it is encouraged that 3 percent of the MIPS eligible clinicians submitted to CMS by the qualified registry be sampled with a minimum sample of 10 TIN/NPIs or a maximum sample of 50 MIPS eligible clinicians. For each MIPS eligible clinician sampled, it is encouraged that 25 percent of the MIPS eligible clinicians' patients (with a minimum sample of five patients or a maximum

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

sample of 50 patients) should be reviewed for all measures applicable to the patient.

- Provide the results of the executed data validation plan by May 31st of the year following the performance period. If the results indicate the qualified registry's validation reveals inaccuracy or low compliance provide to us an improvement plan. Failure to implement improvements may result in the qualified registry being placed in a probationary status or disqualification from future participation.

We did not receive any comments on the proposal regarding information required at the time of self-nomination for a qualified registry. Therefore, we are finalizing the above policies as proposed.

#### (4) Qualified Registry Criteria for Data Submission:

Further, we proposed that a qualified registry must perform the following functions:

- For measures, activities, and objectives under the quality, advancing care information, and improvement activities performance categories and as proposed at §414.1400(a)(4)(i); if the data is derived from CEHRT, the qualified registry must be able to indicate this data source.
- A qualified registry submitting MIPS quality measures that are risk-adjusted (and have the risk-adjusted variables and methodology listed in the measure specifications) must submit the risk-adjusted measure results to CMS when submitting the data for these measures.
- Submit to us, quality measures and activities data on all patients, not just Medicare patients.
- Submit quality measures, advancing care information, or improvement activities performance categories data and results to us in the applicable MIPS performance categories for which the qualified registry is providing data.
- Provide timely feedback, at least four times a year, on all of the MIPS performance categories that the qualified registry will report to us. That is, if the qualified registry will be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

reporting on data for the improvement activities, advancing care information, or quality performance category, all results as of the performance feedback date should be included in the information sent to the MIPS eligible clinician. The feedback should be given to the individual MIPS eligible clinician or group (if participating as a group) at the individual participant level or group level, as applicable, for which the qualified registry reports. The qualified registry is only required to provide feedback based on the MIPS eligible clinician's data that is available at the time the performance feedback is generated.

- A qualified registry must comply with any request by us to review the data submitted by the qualified registry for purposes of MIPS in accordance with applicable law. Specifically, data requested would be limited to the minimum necessary for us to carry out, for example, health care operations or health oversight activities.

- Mandatory participation in ongoing support conference calls hosted by us (approximately one call per month), including an in-person qualified registry kick-off meeting (if held) at our headquarters in Baltimore, MD. More than one unexcused absence could result in the qualified registry being precluded from participation in the program for that year. If a qualified registry is precluded from participation in MIPS, the individual MIPS eligible clinician or group would need to find another entity to submit their MIPS data.

- Agree that data inaccuracies including (but not limited to) TIN/NPI mismatches, formatting issues, calculation errors, data audit discrepancies affecting in excess of 3 percent of the total number of MIPS eligible clinicians submitted by the qualified registry may result in notations on our qualified registry posting of low data quality and would place the qualified registry on probation (if they decide to self-nominate for the next program year). If the qualified registry does not reduce their data error rate below 3 percent in the subsequent year, they would continue to be on probation and have their listing on the CMS Web site continue to note the poor

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

quality of the data they are submitting for MIPS. Data errors affecting in excess of 5 percent of the MIPS eligible clinicians submitted by the qualified registry may lead to the disqualification of the qualified registry from participation in the following year's program. As we gain additional experience with qualified registries, we intend to revisit and enhance these thresholds in future years.

- Be able to report at least six quality measures including one cross-cutting measure and one outcome measure. If an outcome measure is not available, be able to report another high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures).

- Enter into and maintain with its participating MIPS eligible clinicians an appropriate Business Associate agreement that provides for the qualified registry's receipt of patient-specific data from an individual MIPS eligible clinician or group, as well as the qualified registry's disclosure of quality measure results and numerator and denominator data and/or patient specific data on Medicare and non-Medicare beneficiaries on behalf of MIPS eligible clinicians or group.

- Obtain and keep on file signed documentation that each holder of an NPI whose data are submitted to the qualified registry, has authorized the qualified registry to submit quality measure results, improvement activities measure and activity results, advancing care information objective results and numerator and denominator data or patient-specific data on Medicare and non-Medicare beneficiaries to us for the purpose of MIPS participation. This documentation should be obtained at the time the MIPS eligible clinician or group signs up with the qualified registry to submit MIPS data to the qualified registry and must meet any applicable laws, regulations, and contractual business associate agreements. Groups participating in MIPS via a qualified registry may have their group's duly authorized representative grant permission to the qualified registry to submit their data to us. If submitting as a group each individual MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

eligible clinician does not need to grant their individual permission to the qualified registry to submit their data to us.

- Not be owned and managed by an individual locally-owned single specialty group (for example, single specialty practices with only one practice location or solo practitioner practices are prohibited from self-nominating to become a MIPS qualified registry).

- Be able to separate out and report on all payers, including Medicare Part B FFS patients and non-Medicare patients.

- Provide the measure numbers for the MIPS quality measures on which the qualified registry is reporting.

- Provide the measure title (and specialty-specific measure set title, if applicable) for the MIPS quality measures and improvement activities (if applicable) on which the qualified registry is reporting.

- Indicate if the qualified registry will be reporting the advancing care information component measures and objectives.

- Report the number of eligible instances (reporting denominator).

- Report the number of instances a quality service is performed (performance numerator).

- Report the number of performance exclusions, meaning the quality action was not performed for a valid reason as defined by the measure specification.

- Comply with a CMS-specified secure method for data submission, such as submitting the qualified registry's data in an XML file.

- Sign a document verifying the qualified registry's name, contact information, cost for MIPS eligible clinicians or groups to use the qualified registry, services provided, and the specialty-specific measure sets the qualified registry intends to report. Once posted on the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

qualified registry's CMS Web site, the qualified registry will need to support the measures or measure sets confirmed by the qualified registry. Failure to do so will may preclude the qualified registry from participation in MIPS in the subsequent year.

- Must provide attestation statements during the data submission period that all of the data (quality measures, improvement activities, and advancing care information measures and objectives, if applicable) and results are accurate and complete.
- For purposes of distributing performance feedback to MIPS eligible clinicians, collect a MIPS eligible clinician's email address(es) and have documentation from the MIPS eligible clinician authorizing the release of his or her email address.
- Be able to calculate and submit measure-level reporting rates or, upon request, the data elements needed to calculate the reporting and performance rates by TIN/NPI and/or TIN.
- Be able to calculate and submit, by TIN/NPI or TIN, a performance rate (that is the percentage of a defined population who receive a particular process of care or achieves a particular outcome based on a calculation of the measures' numerator and denominator specifications) for each measure on which the TIN/NPI and/or TIN reports or, upon request the Medicare and non-Medicare level data elements needed to calculate the performance rates.
- Provide the performance period start date the qualified registry will cover.
- Provide the performance period end date the qualified registry will cover.
- Report the number of instances in which the applicable submission criteria were not met, for example, the quality measure was not reported and a performance exclusion did not apply.
- For data validation purposes, provide information on the entity's sampling methodology. For example, it is encouraged that 3 percent of the MIPS eligible clinicians be sampled with a minimum sample of 10 MIPS eligible clinicians or a maximum sample of 50

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS eligible clinicians. For each MIPS eligible clinician sampled, it is encouraged that 25 percent of the MIPS eligible clinicians' patients (with a minimum sample of five patients or a maximum sample of 50 patients) should be reviewed for all measures applicable to the patient.

The following is a summary of the comments we received regarding our proposal for the qualified registry criteria for data submission.

Comment: One commenter requested assurance that Immunization Registries and Immunization Information Systems (IIS) did not fall into the category of a qualified registry.

Response: We would like to explain that any organization that would like to become a qualified registry for the MIPS must self-nominate and meet the requirements of qualified registries described within this final rule with comment period.

Comment: One commenter recommended the Quality Markers program (qualified vendor and a qualified registry under PQRS) as a reporting tool.

Response: We would like to explain that any organization that would like to become a qualified registry for the MIPS must self-nominate and meet the requirements of qualified registries described within this rule. MIPS eligible clinicians and groups have the option to choose whatever data submission method best suits their practice.

Comment: A few commenters agreed that a qualified registry must provide attestation statements from the qualified registry or MIPS eligible clinicians during the data submission period that all the data and results are accurate and complete.

Response: We appreciate the support and are working to streamline this process for registries by allowing the attestation at the time of actual data submission.

Comment: One commenter was concerned about the cost of the qualified registries and questioned if CMS could provide a qualified registry or EHR at low cost.

Response: We will take the commenters suggestion under consideration of creating a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

CMS registry or EHR for future rulemaking.

After consideration of the comments regarding qualified registry criteria for data submission we are finalizing the above policies as proposed with one modification. Based on our policies finalized in section II.E.5.b.(3) of this final rule with comment period, we are not requiring MIPS eligible clinicians to submit data on cross-cutting measures. Therefore, we are finalizing at §414.1335(a)(1)(i) the requirement for registries as follows: Be able to submit results for at least six quality measures including one outcome measure. If an outcome measure is not available, be able to submit results for at least one other high priority measure (appropriate use, patient safety, efficiency, patient experience, and care coordination measures). If no outcome measure is available, then the registry must provide a justification for not including an outcome measure.

#### d. CMS-Approved Survey Vendors

As discussed in the proposed rule (81 FR 28188), we proposed to allow groups to report CAHPS for MIPS survey measures. We proposed the data collected on the CAHPS for MIPS survey measures would be transmitted to us via a CMS-approved survey vendor.

For purposes of MIPS, we proposed to define a CMS-approved survey vendor at §414.1305 as a survey vendor that is approved by us for a particular performance period to administer the CAHPS for MIPS survey and transmit survey measures data to us. We proposed at §414.1400(i) that vendors are required to undergo the CMS approval process for each year in which the survey vendor seeks to transmit survey measures data to us. We anticipate retaining the same policies and procedures we currently follow for a CMS-approved survey vendor for PQRS and apply them to a MIPS CMS-approved survey vendor. We proposed the following criteria for a CMS-approved survey vendor for the CAHPS for MIPS survey. A CMS-approved survey vendor for CAHPS for MIPS must:

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(1) Comply with and complete the Vendor Participation Form – We anticipate retaining the same application process and Vendor Participation Form that was required for the CAHPS for PQRS survey. Please refer to <http://www.pqrscahps.org/en/participation-form/> for further details. Therefore, we proposed at §414.1400(i) that all CMS-approved survey vendor applications and materials will be due April 30 of the performance period. However, we sought comments on whether the deadline for CMS-approved survey vendor applications and materials should be earlier, such as prior to the beginning of the performance period. In addition, we proposed the following items will be required for your organization to be a CMS-approved survey vendor of the CAHPS for MIPS survey:

- Meet all of the Minimum Survey Vendor Business Requirements at the time of the submission of the Vendor Participation Form; and
- Complete the Vendor Participation Form.

(2) Comply with the Minimum Survey Vendor Business Requirements - We anticipate retaining the same minimum survey business requirements that were required for the CAHPS for PQRS survey. Please refer to <http://www.pqrscahps.org/en/business-requirements/> for further details. We proposed Applicant Organizations (survey vendor and subcontractors) must possess all required facilities and systems to implement the CAHPS for MIPS survey. Subcontractors will be subject to the same requirements as the applicant vendor. Organizations that are approved to administer the CAHPS for MIPS s-Survey must conduct all their CAHPS for MIPS business operations within the United States. This requirement applies to all staff and subcontractors. In addition, we proposed to request information regarding:

- Relevant organization and survey experience.
- Survey capability and capacity.
- Adherence to quality assurance guidelines and participation in quality assurance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

activities.

- Documentation requirements.
- Adhere to all protocols and specifications, and agree to participate in training sessions

Specifically, to obtain our approval, we proposed that survey vendors would be required to undergo training, meet our standards on how to administer the survey, and submit a quality assurance plan. We would provide the identified survey vendor with an appropriate sample frame of beneficiaries from each group that has contracted with the survey vendor and elected to participate in the CAHPS for MIPS survey. The survey vendor would also be required to administer the survey according to established protocols to ensure valid and reliable results. More information on quality assurance and protocols can be reviewed at <http://www.pqrscahps.org/en/quality-assurance-guidelines/>. CMS-approved survey vendors would be supplied with mail and telephone versions of the survey in electronic form, and text for beneficiary pre-notification and cover letters. CAHPS for MIPS surveys can be administered in English, Spanish, Cantonese, Mandarin, Korean, Russian and/or Vietnamese. Survey vendors would be required to use appropriate quality control and security (to include encryption and backup) procedures to maintain survey response data. The data would then be securely sent back to us for scoring and/or validation in accordance with applicable law. To ensure that a survey vendor possesses the ability to transmit survey measures data for a particular performance period, we propose to require survey vendors to undergo this approval process for each year in which the survey vendor seeks to transmit survey measures data to us. We requested comments on this proposal.

The following is a summary of the comments we received regarding the CMS-approved survey vendors.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: One commenter recommended that CMS-approved survey vendors should have 2 years of prior experience selecting random samples based on specific eligibility criteria, work with their contracted client medical group(s) or MIPS eligible clinician(s) to obtain patient data for sampling via HIPAA compliant electronic data transfer processes, and adequately document the sampling process.

Response: We will take these comments into consideration in future rulemaking.

After consideration of the comments regarding CMS-approved survey vendors we are finalizing §414.1305, §414.1400(i), and the above policies as proposed.

e. Probation and Disqualification of a Third Party Intermediary

We proposed at §414.1400(k) a process for placing third party intermediaries on probation and for disqualifying such entities for failure to meet certain standards established by CMS. Specifically, we proposed that if at any time we determine that a third party intermediary (that is, a QCDR, health IT vendor, qualified registry, or CMS-approved survey vendor) has not met all of the applicable criteria for qualification, we may place the third party intermediary on probation for the current performance period and/or the following performance period, as applicable.

In addition, we proposed that we require a corrective action plan from the third party intermediary to address any deficiencies or issues and prevent them from recurring. We proposed the corrective action plan must be received and accepted by us within 14 days of the CMS notification to the third party intermediary of the deficiencies or probation. Failure to comply with this would lead to disqualification from MIPS for the subsequent performance period.

We proposed probation to mean that, for the applicable performance period, the third

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

party intermediary would not be allowed to miss any meetings or deadlines and would need to submit a corrective action plan for remediation or correction of deficiencies identified that resulted in the probation.

In addition, we proposed that if the third party intermediary has data inaccuracies including (but not limited to) TIN/NPI mismatches, formatting issues, calculation errors, data audit discrepancies affecting in excess of 3 percent (but less than 5 percent) of the total number of MIPS eligible clinicians or groups submitted by the third party intermediary, we would annotate on the CMS qualified posting that the third party intermediary furnished data of poor quality and would place the entity on probation for the subsequent MIPS performance period with the opportunity to go on probation for a year to correct their deficiencies.

Further, we proposed if the third party intermediary does not reduce their data error rate below 3 percent for the subsequent performance period, the third party intermediary would continue to be on probation and have their listing on the CMS Web site continue to note the poor quality of the data they are submitting for MIPS for one additional performance year. After 2 years on probation, the third party intermediary would be disqualified for the subsequent performance year. Data errors affecting in excess of 5 percent of the MIPS eligible clinicians or groups submitted by the third party intermediary may lead to the disqualification of the third party intermediary from participation for the following performance period. In placing the third party intermediary on probation; we would notify the third party intermediary of the identified issues, at the time of discovery of such issues.

Finally, we proposed if the third party intermediary does not submit an acceptable corrective action plan within 14 days of notification of the deficiencies and correct the deficiencies within 30 days or before the submission deadline—whichever is sooner, we may disqualify the third party intermediary from participating in MIPS for the current performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

period and/or the following performance period, as applicable. We requested comments on these proposals.

The following is a summary of the comments we received regarding probation and disqualification of a third party intermediary.

Comment: A few commenters agreed that CMS should implement a process for placing third party intermediaries on probation for disqualifying such entities for failure to meet certain standards.

Response: We appreciate the commenters' support.

Comment: Some commenters expressed concern about the potential for qualified QCDRs and registries to subsequently fail to fulfill their reporting criteria and advised CMS to finalize language holding MIPS eligible clinicians harmless in the event of a vendor data failure.

Response: CMS cannot ensure that third party intermediaries will meet the applicable submission criteria in all instances. We can, however, monitor the success of these entities and preclude their participation in the program in future years. Further, we note that MIPS eligible clinicians are ultimately responsible for the data that is submitted by their third party intermediaries and expect that MIPS eligible clinicians are ultimately holding their third party intermediaries accountable for accurate reporting. We refer readers to section II.E.8.c. of this final rule with comment period for more information on the targeted review process.

Comment: A few commenters supported CMS' proposal to provide an initial probationary period where a third party intermediary can correct identified issues, and recommends that if a QCDR is found not able to submit accurate data, then CMS should assess MIPS eligible clinicians who used that QCDR as "average" for the MIPS quality performance category. The commenters recommended that CMS change the corrective action plan deadline to 21 days or any timeline as agreed upon by both CMS and the submitter, as depending on the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

issue and the entity, 14 days may not be reasonable. Another commenter believed that 14 days is too short to properly diagnose a problem and 30 days is too short to solve it. The commenter requested 30 days for diagnosis and 45 for the implementation of the solution, to prevent hasty coding that may cause future errors.

Some commenters proposed that at least 30 days be allowed for the corrective action plan and an additional 45 days to deploy the solution; the imminence of a reporting deadline should not limit the time available to deploy a solution; such haste could create additional problems for clinicians and CMS. The commenters also recommended that CMS have provisions in place to use updated data submitted after the reporting deadline. The commenters stated that 14 days could be much too little time to properly diagnose a problem and propose and test a solution. Similarly, 30 days could be much too little time to deploy a solution that could require patching software and changes in clinician workflows.

Other commenters stated that timeframes in this section are unreasonably short and recommended they be extended. They believed that it is unreasonable for CMS to expect that a health IT vendor would be able to verify that a problem exists, identify and troubleshoot the source of the problem, and present a precise solution for correcting the problem, within 14 days. The commenters requested that CMS extend this to 30 days, at a minimum. The commenters believed for the correcting deficiencies, 30 days may be unreasonably short and depending on the nature of the problem, believed it can take anywhere from a week to several months to program a software patch, and even longer to correct the problem through a software upgrade. The commenters requested that CMS extend this to 90 days, at a minimum.

Response: We acknowledge the challenges of a 14 day time period for correction of errors by qualified registries and QCDRs, however we believe that the data should be submitted early in the submission window which would allow for a longer correction timeframe.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Additionally, we encourage the qualified entity to run their results through a quality assurance check before submission. The requested time extension would affect CMS' ability to calculate and report final score to MIPS eligible clinicians and their ability to question the results before any MIPS payment adjustments are made the following year.

Comment: A few commenters did not believe QCDRs should be placed on probation if they submit data with inaccuracies. The commenters believed this should be consistent across document and measurement criteria.

Response: We want the MIPS eligible clinicians using QCDRs and qualified registries to be able to have confidence that their data is collected, analyzed, and reported accurately. We provide QCDRs and qualified registries a report of the data issues discovered from each previous participation year so that the entities have an opportunity to correct any identified problems. Accordingly, we believe the best way to ensure we receive accurate data from QCDRs and qualified registries and to protect participating MIPS eligible clinicians is to place entities with high data issue rates on probation or disqualify them from participating in future program years. At the same time, we note that TINs are ultimately responsible for the data that are submitted by their third party intermediaries and expect that TINs are ultimately holding their third party intermediaries accountable for accurate reporting.

Comment: A few commenters expressed concern with the disqualification process and the resulting financial impact to MIPS eligible clinicians and groups. The commenters stated that the third party intermediaries have limited financial risk and burden if they are disqualified, and that financial burden rests on the MIPS eligible clinicians and groups.

Response: We note that MIPS eligible clinicians and groups are ultimately responsible for the data that are submitted by their third party intermediaries and expect that MIPS eligible clinicians and groups should ultimately hold their third party intermediaries accountable for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

accurate reporting. We believe that operational and policy protections that we are putting in place through this final rule with comment period will significantly limit the number of third party intermediaries from being disqualified during the performance period.

Comment: Some commenters stated that they support CMS' proposal for probation and disqualification of third party intermediaries.

Response: We appreciate the commenters' support.

Comment: Other commenters stated that if a QCDR, qualified registry, or EHR vendor is not submitting correct and valid data (after testing, validation and the opportunity to correct), then the QCDR should be placed on a corrective action plan. The commenters added that if after the probationary period the QCDR is still not adequately submitting data, the QCDR should be excluded from future performance periods until such time that it could show through testing that it is able to submit valid data.

Response: We appreciate the comment. If the QCDR or qualified registry has a large percent of their participants whose final data is inaccurate and not usable, then the entity may be excluded from future program years.

Comment: Some commenters suggested that to help resolve potential and on-going issues, CMS should develop a root-cause analysis toolkit that vendors could use to help self-identify issues.

Response: We agree with this suggestion and will look at the feasibility of doing this for future program years.

Comment: A few commenters stated that if a vendor is incapable of submitting accurate data, then the MIPS eligible clinicians who used that vendor should be held harmless from any penalties. Another commenter noted the absence of "hold harmless" provisions to ensure MIPS eligible clinicians would not be subject to penalties under MIPS if a third party intermediary

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

were to have any error rate, and particularly if the intermediary were disqualified, or if they pull out of the market at any point during the reporting period. Similar provisions are included as part of CMS' EHR Incentive Program in the form of hardship exceptions. Specifically, CMS grants hardship exceptions when clinicians faced extreme and uncontrollable circumstances in the form of issues with the certification of the EHR product or products such as delays or decertification. The commenters stated CMS must include such provisions in the final rule with comment period.

Response: We note that MIPS eligible clinicians are ultimately responsible for the data that are submitted by their third party intermediaries and expect that MIPS eligible clinicians and groups should ultimately hold their third party intermediaries accountable for accurate reporting. We will consider cases of vendors leaving the marketplace during the performance period on a case by case basis. We would, however, need proof that the MIPS eligible clinician had an agreement in place with the vendor at the time of their withdrawal from the marketplace.

Comment: One commenter requested that CMS revisit thresholds in regards to data errors as they believed the strict thresholds for corrective action may be counterproductive.

Response: We believe it is necessary to give QCDRs and qualified registries fair notice of the expectation for their performance (as a QCDRs and qualified registries). Data errors affecting in excess of 5 percent of the MIPS eligible clinicians or groups submitted by the third party intermediary may lead to the disqualification of the third party intermediary from participation for the following performance period. We chose a 5 percent data error rate because from past experience under the PQRS program we have found that a 5 percent error rate increases the confidence interval for third party intermediary scoring under MIPS. If the third party intermediaries data is incomplete or inaccurate, this can adversely affect the program as a whole and all MIPS eligible clinicians may suffer from inaccurate or missing data. The QCDR

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

or qualified registry is responsible for ensuring accurate data calculation and submission.

Comment: Some commenters expressed appreciation of the critical importance of accuracy of submitted data. The commenters believed, however, that the proposed error thresholds are too stringent (for example, data audit discrepancies affecting in excess of 3 percent but less than 5 percent of the MIPS eligible clinicians or groups submitted); and that these thresholds as proposed do not take into account the materiality of the errors, or whether they are concentrated in specific clinicians, which could occur due to interactions between workflows and measure logic. The commenters stated there would also need to be exclusions for data calculation errors that could be attributed to poorly or inadequately specified measures. In addition, the commenters stated that until we have mature, well-vetted and error-free measures, this potential will continue to exist and should not result in probation or suspension.

Another commenter believed it would be virtually impossible for most QCDRs to meet the 3 percent error rate criteria to avoid the low data quality notation and threatened probation. The commenter recommended that CMS review the proposal for a 3 percent error rate and adopt an error rate that is more feasible for QCDRs to achieve at this early stage in their development. A few commenters stated it will be important not to penalize submitters with errors in calculations in excess of the three to five percent in the proposed rule if the calculation error is due to a different interpretation of an imprecisely-specified measure.

Response: We established the thresholds of data errors affecting in excess of 5 percent of the MIPS eligible clinicians or groups submitted by the third party intermediary may lead to the disqualification of the third party intermediary from participation for the following performance period. We chose a 5 percent data error rate based on past experience under the PQRS program we have found that a 5 percent error rate increases the confidence interval for third party intermediary scoring under MIPS. In addition, third party intermediaries are considered have

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

experience with handling and calculating data and are experts in quality reporting. The data they submit not only affects the MIPS eligible clinicians and groups for whom they report but can affect other MIPS clinicians as the overall program (MIPS payment incentives vs. MIPS payment adjustments) is budget neutral. Accurate data is therefore imperative for the program as a whole.

Comment: One commenter recommended that CMS establish a process for notifying MIPS eligible clinicians ahead of terminating or placing an entity on probation. This would provide the MIPS eligible clinician time to research an alternative submission mechanisms or vendor.

Response: We agree with the commenter. We intend to notify MIPS eligible clinicians when a third party intermediary is terminated or placed on probation via the qualified posting.

Comment: Another commenter requested a 2-year grace period for implementing of CMS' proposal for probation and disqualification of third party intermediaries, as QCDRs will need to gain experience with these new performance categories.

Response: We would like to note that registry reporting has occurred since 2008, and QCDRs have been in use since 2014. We believe this is an adequate time for qualified registries and QCDRs to be able to report data with few or no errors.

After consideration of the comments regarding auditing of third party intermediaries submitting MIPS data, we are finalizing the proposal at §414.1400(k) to include that if at any time we determine that a third party intermediary (that is, a QCDR, health IT vendor, qualified registry, or CMS-approved survey vendor) has not met all of the applicable criteria for qualification, we may place the third party intermediary on probation for the current performance period and/or the following performance period, as applicable. In addition, we are finalizing that we require a corrective action plan from the third party intermediary to address any deficiencies

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

or issues and prevent them from recurring. We are finalizing the corrective action plan must be received and accepted by us within 14 days of the CMS notification to the third party intermediary of the deficiencies or probation. Failure to comply with this would lead to disqualification from MIPS for the subsequent performance period. In addition, we are finalizing that probation means for the applicable performance period, the third party intermediary would not be allowed to miss any meetings or deadlines and would need to submit a corrective action plan for remediation or correction of deficiencies identified that resulted in the probation. Further, we are finalizing that if the third party intermediary has data inaccuracies including (but not limited to) TIN/NPI mismatches, formatting issues, calculation errors, data audit discrepancies affecting in excess of 3 percent (but less than 5 percent) of the total number of MIPS eligible clinicians or groups submitted by the third party intermediary, we would annotate on the CMS qualified posting that the third party intermediary furnished data of poor quality and would place the entity on probation for the subsequent MIPS performance period with the opportunity to go on probation for a year to correct their deficiencies. In addition, we are finalizing that if the third party intermediary does not reduce their data error rate below 3 percent for the subsequent performance period, the third party intermediary would continue to be on probation and have their listing on the CMS Web site continue to note the poor quality of the data they are submitting for MIPS for one additional performance year. After 2 years on probation, the third party intermediary would be disqualified for the subsequent performance year. Data errors affecting in excess of 5 percent of the MIPS eligible clinicians or groups submitted by the third party intermediary may lead to the disqualification of the third party intermediary from participation for the following performance period. In placing the third party intermediary on probation; we would notify the third party intermediary of the identified issues, at the time of discovery of such issues. Further, we are finalizing that if the third party

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

intermediary does not submit an acceptable corrective action plan within 14 days of notification of the deficiencies and correct the deficiencies within 30 days or before the submission deadline—whichever is sooner, we may disqualify the third party intermediary from participating in MIPS for the current performance period and/or the following performance period, as applicable.

#### (f) Auditing of Third Party Intermediaries Submitting MIPS Data

We proposed at §414.1400(j) that any third party intermediary (that is, a QCDR, health IT vendor, qualified registry, or CMS-approved survey vendor) must comply with certain auditing criteria as a condition of their qualification or approval to participate in MIPS as a third party intermediary. Specifically, we proposed the entity must make available to us the contact information of each MIPS eligible clinician or group on behalf of whom it submits data. The contact information would include, at a minimum, the MIPS eligible clinician or group's practice phone number, address, and, if available, email. Further, we proposed the entity must retain all data submitted to us for MIPS for a minimum of 10 years. We requested comments on this proposal.

The following is a summary of the comments we received regarding auditing of third party intermediaries submitting MIPS data.

Comment: A few commenters noted that CMS proposed that an entity must retain all data submitted to CMS for MIPS for a minimum of 10 years. The commenters stated that they believe this amount of time is excessive and is an invasion of privacy. Another commenter recommended using a lesser time period similar to other health record criteria. Other commenters requested that CMS maintain the current criteria to obtain and keep on file signed documentation for 7 years as is currently required under PQRS.

Another commenter stated that CMS should only require a QCDR to obtain and keep on

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

file signed documentation that each holder of an NPI whose data is submitted to the QCDR and who has authorized the QCDR to submit quality measure results, improvement activities (if applicable), advancing care information objective results and numerator and denominator data (if applicable) and/or patient-specific data on Medicare and non-Medicare beneficiaries to CMS for the purpose of MIPS participation for 3 years beyond each reporting year for which a user participates via the QCDR.

Response: We believe that a 10-year record retention, as proposed, for third party intermediaries is appropriate. We are creating a policy that is intended to align across the various components of the Quality Payment Program and is consistent with the record retention requirement for APMs. This consistency will provide a streamline transition between the MIPS program and the APM program. We are requiring third party intermediaries to retain copies of the contact information and permission to submit data on behalf of a MIPS eligible clinician or group and the aggregated data submitted by the third party intermediary for up to 10 years after the performance year to prepare for verification in the event they are selected for an audit. For the purposes of auditing we reserve the right to lookback 6 years and 3 months. Refer to section II.E.8.e. of this final rule with comment period for information on record retention requirements for MIPS eligible clinicians and groups.

Comment: Some commenters requested that CMS provide important clarification that the audits called for in this section are focused on the accuracy of the health IT vendor and their products and not on the MIPS eligible clinician or group. The commenters further requested that any findings related to the audit of the third party intermediary would be focused on the third party intermediary only and would not lead to actions affecting the MIPS eligible clinician.

Response: We would like to explain that as a condition of their qualification or approval to participate in MIPS, third party intermediaries are required to comply with certain auditing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

criteria, which include a request for an audit, from us or the federal government. Specifically, an applicant or current third party intermediary must consent to and agree to comply with an audit by us or the federal government of all related documentation and data they stored or submitted on behalf of any MIPS eligible clinicians or groups. Those who fail to comply with audit requests will be considered for non-qualified status. This clarification is consistent with the same approach in the auditing provision for addressing MIPS eligible clinicians found in section II.E.8.e. of this final rule with comment period. Data inaccuracies on the part of the third party vendor will be considered when the third party intermediary requests to continue participation in the Quality Payment Program in subsequent years (self-nomination). Data inaccuracies discovered during an audit of a third party intermediary and occurring due to inaccurate data submitted by the MIPS eligible clinician or group, could result in the MIPS eligible clinician or group's data being reviewed as well.

Comment: Other commenters stated that the third party intermediary should not be held responsible for the accuracy of data provided or stored by MIPS eligible clinicians or groups when the third party intermediary would not be in a position to assess the validity of the data.

Response: We appreciate the concern regarding third party intermediaries' responsibility for data accuracy and validity. We would like to explain that the primary purpose of auditing third party intermediaries is to ensure that accurate data is submitted and to maintain the integrity of MIPS payment adjustments made in accordance with program determinations and scoring that are based on data submitted by third party intermediaries. Thus, as part of the qualification and approval requirement to comply with auditing criteria third party intermediaries must ensure that the data they submit to us on behalf of MIPS eligible clinicians and groups is accurate. To meet this requirement, third party intermediaries must have a data validation plan in place, they must execute this plan after they submit data to us, and they must send us the results of their data

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

validation execution report. Please note we also expect third party intermediaries to notify us if their data validation results include a finding that data submitted by a MIPS eligible clinician or group is invalid. Those third party intermediaries who fail to comply with these data validation requirements, as part of their auditing compliance, will be considered non-qualified or non-approved for future MIPS program years.

Comment: Some commenters stated that any negative findings from an audit under this section should not impact the MIPS eligible clinician or group and that they should be “held harmless” from any negative MIPS adjustments or other civil monetary penalties (CMPs) under the False Claims Act.

Response: We understand the concerns regarding the impact audits under this section have on MIPS eligible clinicians and groups. As a general matter, the contractual agreement or other arrangement between a MIPS eligible clinician or groups and a third party intermediary is not within our authority to control and we are not a party to such agreements or arrangements. However, we note that MIPS eligible clinicians and groups may be able to seek recourse against their third party intermediary if significant issues or problems arise. Notwithstanding, MIPS eligible clinicians and groups are ultimately responsible for the data submitted by their third party intermediary on their behalf and we expect MIPS eligible clinicians and groups to hold their third party intermediary accountable for accurate data submissions. Moreover, we suggest that MIPS eligible clinicians and groups work with their third party intermediary to ensure data is submitted timely and accurately.

Comment: A few commenters requested that CMS provide data validation of calculated reporting and performance rates while data is submitted by third party intermediaries including flagging any errors on both format and values.

Response: We are working on increasing the data checks beyond formatting issues in the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

submission engine validation tool which can be used for testing prior to data submission.

Additionally, we are looking at incorporating additional data checks in the portal to be used at the time a file is submitted. This is an on-going process.

After consideration of the comments regarding auditing of third party intermediaries submitting MIPS data, we are modifying the proposal at §414.1400(j) to include the proposed policies that any third party intermediary (that is, a QCDR, health IT vendor, qualified registry, or CMS-approved survey vendor) must comply with the following procedures as a condition of their qualification and approval to participate in MIPS as a third party intermediary: (1) The entity must make available to CMS the contact information of each MIPS eligible clinician or group on behalf of whom it submits data. The contact information will include, at a minimum, the MIPS eligible clinician or group's practice phone number, address, and, if available, email; and (2) The entity must retain all data submitted to CMS for MIPS for a minimum of 10 years. In addition, we are adding that for the purposes of auditing, CMS may request any records or data retained for the purposes of MIPS for up to 6 years and 3 months.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

## 10. Public Reporting on Physician Compare

This section contains the approach for public reporting on Physician Compare for the MIPS, APM, and other information as required by the MACRA.

Physician Compare draws its operating authority from section 10331(a)(1) of the Affordable Care Act. As required, by January 1, 2011, we developed a Physician Compare Internet website with information on physicians enrolled in the Medicare program under section 1866(j) of the Act, as well as information on other EPs who participate in the PQRS under section 1848 of the Act. More information about Physician Compare can be accessed on the Physician Compare Initiative website at <https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/physician-compare-initiative/>.

The first phase of Physician Compare was launched on December 30, 2010 (<http://www.medicare.gov/physiciancompare>). Since the initial launch, Physician Compare has been continually improved and more information has been added. Currently, website users can view information about approved Medicare professionals, such as name, Medicare primary and secondary specialties, practice locations, group affiliations, hospital affiliations that link to the hospital's profile on Hospital Compare as available, Medicare Assignment status, education, residency, and American Board of Medical Specialties (ABMS), American Osteopathic Association (AOA), and American Board of Optometry (ABO) board certification information. For group practices, users can view group practice names, specialties, practice locations, Medicare assignment status, and affiliated professionals. In addition, Medicare professionals and group practices that satisfactorily or successfully participated in a CMS quality program have a green check mark on their profile page to indicate their commitment to quality.

Consistent with section 10331(a)(2) of the Affordable Care Act, Physician Compare also phased in public reporting of information on physician performance that provides comparable

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

information on quality and patient experience measures for reporting periods beginning January 1, 2012. To the extent that scientifically sound measures are developed and are available, Physician Compare is required to include, to the extent practicable, the following types of measures for public reporting, for example: measures collected under PQRS and an assessment of efficiency, patient health outcomes, and patient experience, as specified. The first set of quality measures were publicly reported on Physician Compare in February 2014. Currently, Physician Compare publicly reports 14 group practice level measures collected through the Web Interface for groups of 25 or more EPs participating in 2014 under the PQRS and for ACOs participating in the Shared Savings Program or Pioneer ACO program, and six individual level measures collected through claims for individual EPs participating in 2014 under the PQRS. A complete history of public reporting on Physician Compare is detailed in the CY 2016 PFS final rule (80 FR 71117 through 71122).

As finalized in the CY 2015 and CY 2016 PFS final rules (79 FR 67547 and 80 FR 70885) Physician Compare will expand public reporting over the next several years. This expansion includes publicly reporting both individual EP (now referred to as clinician) and group practice level QCDR measures starting with 2015 individual clinician measures on Physician Compare in late 2016, and expanding public reporting of group practice QCDR measures in late 2017 (80 FR 71125).

Section 1848(q)(9)(A) and (D) of the Act facilitates the continuation of the phased approach to public reporting by requiring the Secretary to make available on the Physician Compare website, in an easily understandable format, individual MIPS eligible clinician and groups performance information, including:

- The MIPS eligible clinician's final score;
- The MIPS eligible clinician's performance under each MIPS performance category

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(quality, cost, improvement activities, and advancing care information);

- Names of eligible clinician's in Advanced APMs and, to the extent feasible, the names of such Advanced APMs and the performance of such models; and
- Aggregate information on the MIPS, posted periodically, including the range of final scores for all MIPS eligible clinician's and the range of the performance of all MIPS eligible clinician's for each performance category.

The proposals related to each of these requirements are addressed below.

Section 1848(q)(9)(B) of the Act also requires that this information indicate, where appropriate, that publicized information may not be representative of the eligible clinician's entire patient population, the variety of services furnished by the eligible clinician, or the health conditions of individuals treated. The information mandated for Physician Compare under section 1848(q)(9) of the Act will generally be publicly reported consistent with section 10331(a)(2) and 10331(b) of the Affordable Care Act, and like all measure data included on Physician Compare, will be comparable. In addition, section 10331(b) of the Affordable Care Act requires that we include, to the extent practicable, processes to ensure that data made public are statistically valid, reliable, and accurate, including risk adjustment mechanisms used by the Secretary. In addition to the public reporting standards identified in the Affordable Care Act – statistically valid and reliable data that are accurate and comparable –we have established a policy that, as determined through consumer testing, the data we disclose generally should resonate with and be accurately interpreted by consumers to be included on Physician Compare profile pages. Together, we refer to these conditions as the Physician Compare public reporting standards (80 FR 71118 through 71120). Section 10331(d) of the Affordable Care Act also requires us to consider input from multi-stakeholder groups, consistent with sections 1890(b)(7) and 1890A of the Act. We also continue to receive general input from stakeholders on Physician

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Compare through a variety of means, including rulemaking and different forms of stakeholder outreach (for example, Town Hall meetings, Open Door Forums, webinars, education and outreach, Technical Expert Panels, etc.).

In addition, section 1848(q)(9)(C) of the Act requires the Secretary to provide an opportunity for MIPS eligible clinicians to review the information that will be publicly reported prior to such information being made public. This is generally consistent with section 10331(a)(2) of the Affordable Care Act, under which we have established a 30-day preview period for all measurement performance data that allows physicians and other eligible clinicians to view their data as it will appear on the website in advance of publication on Physician Compare (80 FR 71120). Section 1848(q)(9)(C) of the Act also requires that MIPS eligible clinicians be able to submit corrections for the information to be made public. We proposed that this extension of the current Physician Compare 30-day preview period will be implemented starting with data from the 2017 MIPS performance period. We proposed a 30-day preview period in advance of the publication of data on Physician Compare (81 FR 28290). We proposed to coordinate efforts between Physician Compare and the four performance categories of MIPS in terms of data review and any relevant data resubmission or correction. All data available for public reporting – measure rates, scores, and attestations – would be available for review and correction during the targeted review process (81 FR 28278). The process would begin at least 30 days in advance of the publication of new data. Data under review will not be publicly reported until the review is complete. All corrected measure rates, scores, and attestations submitted would be available for public reporting. The technical details of the process would be communicated directly to affected MIPS eligible clinicians and groups and detailed outside of rulemaking.

As with the current process, the details would be made public on the Physician Compare

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Initiative page on cms.gov and communicated through Physician Compare and other CMS listservs.

The following is a summary of the comments we received regarding our proposal to implement a 30-day preview period in advance of the publication of data on Physician Compare.

Comment: Some commenters requested that CMS extend the preview period from 30 days to 45, 60, or 90 days. Some commenters noted 30 days was too short, and others more specifically indicated more time was needed to fully review their data.

Response: Finalizing a 30-day preview period for MIPS eligible clinicians is consistent with the preview period we have adopted for Physician Compare for other types of data (80 FR 71120), and has proven sufficient to fully review the data currently publicly reported. We will explore the preview period duration to assess it is providing adequate time for review and data resubmission, when necessary, once the Quality Payment Program begins to receive a higher volume of data on a more frequent basis, which will be done through separate notice-and-comment rulemaking.

Comment: Commenters requested that data being contested is not published on Physician Compare.

Response: We will coordinate efforts between Physician Compare and the four performance categories of MIPS in terms of targeted review and any relevant data resubmission or correction. All data available for public reporting – measure rates, scores, and attestations – will be available for review and correction during the targeted review process (see II.E.8.c. of this final rule with comment period). The process will begin at least 30 days in advance of the publication of new data. Data under a review will not be publicly reported until the review is complete. As proposed, all corrected measure rates, scores, and attestations submitted will be available for public reporting. The technical details of the process will be communicated directly

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to affected MIPS eligible clinicians and groups and detailed outside of rulemaking.

After consideration of the comments, we are finalizing our policy as proposed. As consistent with current practice (80 FR 71120), we are adopting a 30-day preview period in advance of the publication of data on Physician Compare.

In addition, section 1848(q)(9)(D) of the Act requires that aggregate information on the MIPS be periodically posted on the Physician Compare website; including the range of final scores for all MIPS eligible clinicians and the range of performance for all MIPS eligible clinicians for each performance category.

Lastly, section 104(e) of the MACRA requires the Secretary to make publicly available, on an annual basis (beginning with 2015), in an easily understandable format, information for physicians and other eligible clinician's on items and services furnished to Medicare beneficiaries, and to include, at a minimum:

- Information on the number of services furnished under Part B, which may include information on the most frequent services furnished or groupings of services;
- Information on submitted charges and payments for Part B services; and
- A unique identifier for the physician or other eligible clinician that is available to the public, such as an NPI.

The information would further be required to be made searchable by at least specialty or type of physician or other eligible clinician; characteristics of the services furnished (such as, volume or groupings of services); and the location of the physician or other eligible clinician.

Therefore, at §414.1395(a) we proposed public reporting of an eligible clinician's MIPS data; in that for each program year, we would post on a public website, in an easily understandable format, information regarding the performance of MIPS eligible clinicians or groups under the MIPS. This proposal and related public comments are addressed in detail

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

below.

Furthermore, in accordance with section 104(e) of the MACRA, we finalized a policy in the CY 2016 PFS final rule (80 FR 71130) to add utilization data to the Physician Compare downloadable database. Utilization data is currently available at <http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/Medicare-Provider-Charge-Data/Physician-and-Other-Supplier.html>. This information will be integrated on the Physician Compare website via the downloadable database using the most current data starting with the 2016 data, targeted for initial release in late 2017 (80 FR 71130). Not all available data will be included. The specific HCPCS codes included will be determined based on analysis of the available data, focusing on the most used codes. Additional details about the specific HCPCS codes that will be included in the downloadable database will be provided to stakeholders in advance of data publication. And, all data available for public reporting – on the consumer-facing website pages or in the downloadable database – will be available for review during the 30-day preview period.

We believe section 10331 of the Affordable Care Act supports our overarching goals of the MACRA by providing consumers with quality information that will help them make informed decisions about their health care, while encouraging clinicians to improve the quality of care they provide to their patients. In accordance with section 10331 of the Affordable Care Act, section 1848(q)(9) of the Act, and section 104(e) of the MACRA, we plan to continue to publicly report performance information on Physician Compare. As a result, we proposed inclusion of the following information on Physician Compare (81 FR 28291 through 28293).

a. Final Score, Performance Categories, and Aggregate Information

As noted, section 1848(q)(9)(A) and (D) of the Act requires that we publicly report on Physician Compare the final score for each MIPS eligible clinician, performance of each MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

eligible clinician for each performance category, and periodically post aggregate information on the MIPS, including the range of final scores for all MIPS eligible clinicians and the range of performance of all the MIPS eligible clinicians for each performance category. We proposed that these data would be added to Physician Compare for each MIPS eligible clinician or group, either on the profile pages or in the downloadable database, as technically feasible. Statistical testing and consumer testing, as well as consultation of the Physician Compare Technical Expert Panel (TEP), would determine how and where these data are reported on Physician Compare. We requested comments on these proposals.

The following is a summary of the comments we received regarding our proposal to publicly report on Physician Compare the final score for each MIPS eligible clinician, performance of each MIPS eligible clinician for each performance category, and periodically post aggregate information on the MIPS, including the range of final scores for all MIPS eligible clinicians and the range of performance of all the MIPS eligible clinicians for each performance category.

Comment: Commenters suggested that CMS limit initial public reporting on MIPS clinicians to their final score and performance category participation and not publicly report any of the specific measures within any of the performance categories at this time. Some commenters, however, expressed concern with public posting of the final score for clinicians because they believe it does not fully represent quality and may be misleading regarding the quality of care provided. There was also concern it may lead to comparisons across different specialties. Some of these and other commenters encouraged CMS to report the specific measures within performance categories instead of the final score. Another commenter opposed publishing the final score for groups with fewer than ten eligible clinicians. Other commenters recommended that CMS delay publishing final scores and performance by category until it has

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

been further tested to ensure it is fully understood by consumers and truly represents quality care, and to ensure clinicians have time to learn from and improve on their early performance.

Some commenters believe all category scores should be visible on Physician Compare rather than just the final score noting the final score oversimplifies performance without taking into consideration things like higher costs. Another commenter recommended that in the first few years of MIPS data be shared only with clinicians and after this period consider all MIPS data for public reporting.

Other commenters suggested that CMS implement precautions before releasing certain information (for example, quality, cost, and utilization data) on Physician Compare as individualized data without explanation could be misleading, and instead encouraged CMS to release this information only to professional societies. Another commenter encouraged CMS to include contextual information to clarify which eligible clinicians could and could not submit data in the first 2 years of MIPS so lack of reporting is not misinterpreted by consumers.

Additional commenters encouraged CMS to obtain ample feedback from patients and clinicians prior to posting information to Physician Compare to ensure that public reporting standards are upheld, including the requirement that all data resonate with and be accurately interpreted by consumers. Another commenter stated it is important for CMS to determine the accuracy of the data posted on Physician Compare.

Response: Data for the final score and performance categories will be added to Physician Compare for each MIPS eligible clinician or group, either on the profile pages or in the downloadable database. Statistical testing and consumer testing, as well as consultation of the Physician Compare TEP, will determine how, where, and when these data are best reported on Physician Compare. Publicly reporting MIPS data continues the ongoing phased approach to public reporting we have been engaging in since the release of the 2012 PQRS data, allowing us

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to continue this public reporting process and therefore continue to provide helpful information valued by consumers in their health care decision-making process.

The statistical and consumer testing done ensures the data are accurate, they represent quality of care, and they are well understood and correctly interpreted by consumers. The nature of how clinicians and groups are searched on Physician Compare facilitates comparison within specialty, not across. And, language is currently available on the site to explain that lack of data does not mean lack of quality care, and this concept has been well understood in previous consumer testing. Previous testing has also shown that consumers not only accurately interpret but need aggregate scoring, such as composite scores and star ratings, to best understand what are often complex data. These aggregations are not oversimplifications, but beneficial tools for the average consumer to use to best interpret the data. And, although we appreciate the request to have more time to learn from and improve on the data collected, as a continuation of the existing public reporting plan, we believe clinicians have had the opportunity to benefit from previous years of data submission as public reporting was slowly phased in under the PQRS and the data under MIPS are well timed for public reporting.

Comment: Commenters believe CMS should include MIPS information in the downloadable database as they supported making public all statistically valid and reliable data, but appreciated the importance of not overwhelming consumers with too much information on profile pages. Some commenters stated that they would like all information added to the profile pages, including basic demographic and descriptive information, to be proposed for public comment along with results of statistical and consumer testing for measure data.

Response: Again, as noted, typically data considered for public reporting on public profile pages must meet all public reporting criteria. Summary reports of TEP meetings are shared publicly on the Physician Compare Initiative website on CMS.gov. This documentation

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

provides an overview of the statistical and consumer testing conducted as part of the measure review process for Physician Compare. To fulfill the purpose of the website and ensure consumers have the information they need to make informed health care decisions it is important to continue to include quality information on the profile pages in addition to making data available in the downloadable database, as appropriate.

Comment: One commenter objected to the public reporting of zeroes on the Physician Compare website; indicating this could misrepresent physicians who choose not to share data.

Response: We will take this into consideration as we analyze data for public reporting on Physician Compare. However, it is important to note that if a measure is not submitted, there is no performance rate publicly reported. If a measure is reported and the performance rate is zero, this is available for public reporting.

Comment: One commenter expressed concern about public reporting, generally, noting that without virtual groups by specialty, the consequences for many specialties will be inaccurate scoring. They will be unable to report correct measures.

Response: Only those groups and eligible clinicians with measure data will be scored and have measure data included on Physician Compare. The data reported will be at the clinician and group level respectively. The absence of Virtual Groups will not impact the data consumers see for clinicians and groups. As Virtual Groups are implemented we will take this feedback into consideration for public reporting on Physician Compare.

Comment: One commenter recommended that CMS thoroughly explain Physician Compare data to the consumers. The commenter agreed that some of the performance categories were difficult to understand for both consumers and clinicians.

Response: As noted, all data included on the Physician Compare profile pages is tested with consumers to ensure that the information is accurately interpreted and meaningful to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

consumers. In addition to consumer testing, we are also engaging in increasing consumer outreach around Physician Compare and MACRA data, specifically, to ensure this information is clear and useful to consumers. This process will be ongoing.

After consideration of the comments and for the reasons we explained previously, we are finalizing our proposal to report on Physician Compare the final score for each MIPS eligible clinician, performance of each MIPS eligible clinician for each performance category, and to periodically post aggregate information of such data. Accordingly, we are finalizing §414.1395(a), which provides that for public reporting of an eligible clinician's MIPS data in that for each program year, we will post on a public website, in an easily understandable format, information regarding the performance of MIPS eligible clinicians or groups under the MIPS. As we discussed in this final rule with comment period, such data will be posted on Physician Compare, as required by MACRA; however, we will use statistical and consumer testing for purposes of determining how and where such data will be reported on Physician Compare. A detailed discussion of comments for each performance category of MIPS data is included below.

In addition, we solicited comment on the advisability and technical feasibility of including data voluntarily reported by eligible clinicians and groups that are not subject to MIPS payment adjustments, such as those practicing through RHCs, FQHCs, etc., on Physician Compare, which would be addressed through separate notice-and-comment rulemaking.

The following is a summary of the comments we received regarding our solicitation of comments for including data voluntarily reported by eligible clinicians and groups that are not subject to MIPS payment adjustments.

Comment: One commenter supported giving FQHCs who voluntarily submit data under MIPS, appropriately adjusted for patients' social determinants of health, the option to have the data published on Physician Compare. Another commenter also generally supported allowing

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

any eligible clinician or group that voluntarily reported data to have the data publicly reported on Physician Compare. One commenter did caution against publicly reporting RHC data noting concern around the assumptions that could be drawn from the data.

Response: We may consider these suggestions in future notice-and-comment rulemaking.

#### b. Quality

As detailed in the proposed rule, consistent with the current policy that makes all current PQRS measures available for public reporting, we proposed to make all measures under the MIPS quality performance category (81 FR 28184) available for public reporting on Physician Compare (81 FR 28291). This would include all available measures reported via all available submission methods, and applies to both MIPS eligible clinicians and groups.

Also consistent with current policy, although all measures will be available for public reporting not all measures will be made available on the consumer-facing website profile pages. As explained in the proposed rule (81 FR 28291), providing too much information can overwhelm consumers and lead to poor decision making. Therefore, consistent with section 1848(q)(9)(A)(i)(II) of the Act, we proposed that all measures in the quality performance category that meet the statistical public reporting standards would be included in the downloadable database, as technically feasible. We also proposed that a subset of these measures would be publicly reported on the website's profile pages, as technically feasible, based on consumer testing. Statistical testing and consumer testing would determine how and where measures are reported on Physician Compare. In addition, we proposed to apply our existing policy of not publicly reporting first year measures, meaning new measures that have been in use for less than 1 year, regardless of submission methods. After a measure's first year in use, we would evaluate the measure to see if and when the measure is suitable for public reporting (81 FR 28291).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Currently, there is a minimum sample size requirement of 20 patients for performance data to be included on the website. As part of the MIPS and APMs RFI we asked for comment on moving away from this requirement and moving to a reliability threshold for public reporting. In general, commenters supported a minimum reliability threshold. As a result, we proposed to institute a minimum reliability threshold for public reporting this data on Physician Compare (81 FR 28291).

The reliability of a measure refers to the extent to which the variation in measure is due to variation in quality of care as opposed to random variation due to sampling. Statistically, reliability depends on performance variation for a measure across entities, the random variation in performance for a measure within an entity's panel of attributed beneficiaries, and the number of beneficiaries attributed to the entity. High reliability for a measure suggests that comparisons of relative performance across entities, in this case groups or eligible clinicians, are likely to be stable and consistent, and that the performance of one entity on the quality measure can confidently be distinguished from another. Conducting analysis to determine reliability of the data collected will allow us to calculate the minimum reliability threshold for those data. Once an appropriate minimum reliability threshold is determined, the reporting of reporters' performance rates for a given measure can be restricted to only those meeting the minimum reliability threshold.

We proposed to also include the total number of patients reported on per measure in the downloadable database to facilitate transparency and more accurate understanding and use of the data. We requested comments on these proposals (81 FR 28291).

We also solicited comment on the types of data that should be reported on Physician Compare as the MIPS program evolves, specifically in regard to the quality performance category. Any regulatory changes would be made in separate notice-and-comment rulemaking.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The following is a summary of the comments we received regarding our proposal related to public reporting data from the MIPS quality performance category (81 FR 28291).

Comment: Several commenters agreed with the proposal that all measures in the quality performance category that meet the public reporting standards should be included in the downloadable database, as technically feasible. Some noted it was beneficial because then QCDRs and qualified registries can use this data to report back to eligible clinicians and groups on how they compare to others. Other commenters noted that the quality performance category measures should only be reported if there were clear measure descriptions that allowed consumers to understand the measures in context and individual measures were reported along with benchmark and score ranges. Some commenters cautioned against publicly reporting measures for specific specialties that may be more difficult for consumers to understand.

Response: In this final rule, we are finalizing our proposal that all measures in the quality performance category that meet the statistical public reporting standards will be included in the downloadable database, as technically feasible. Per suggestions that commenters made regarding consumer understanding of the quality performance category measure data, only those measures that also test well with consumers will be included on the public facing profile pages. This includes testing plain language measure descriptions that provide the information in an easy-to-understand format and in context, to ensure measures are fully explained and accurately understood. We also plan to include, as feasible, the individual measures in addition to the aggregate information as consumers and clinicians find value in both.

Comment: Some commenters recommended not publicly reporting on new measures for as many as 3 years so that clinicians and groups had more time to learn from the measures and their performance in early years of reporting.

Response: We are finalizing our proposal to continue to not publicly report first year

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measures, meaning new measures that have been in use for less than 1 year, regardless of submission methods. After a measure's first year in use, we will evaluate the measure to see if and when the measure is suitable for public reporting and will take into consideration concerns expressed around publishing newer data during that review process. However, experience with public reporting to date has shown that 1 year is generally sufficient and provides adequate time to assess the measure and to provide clinicians and groups an opportunity to gain experience collecting the measure as well as provide feedback to help them improve on the measure before the data are made public.

Comment: Commenters supported the use of a minimum reliability threshold for measures, and agreed with the use of Physician Compare public reporting standards, because together these will ensure accurate data that are statistically comparable. One commenter also noted it was important to ensure adequate sample sizes in addition to the reliability threshold.

Response: We appreciate this support and agree and will move forward with the reliability threshold in conjunction with our existing public reporting standards and minimum sample size of 20 to ensure confidentiality and sufficient data.

Comment: One commenter stated that data needed to be properly vetted for accuracy and multiple commenters noted data should be risk-adjusted prior to being posted on Physician Compare.

Response: We agree data should be vetted prior to being publicly reported on Physician Compare. As stated previously, data from the quality performance category must meet our statistical public reporting standards to be publicly reported on Physician Compare. As explained in section II.E.5.b. of this final rule with comment period, under the IMPACT Act, ASPE has been conducting studies on the issue of risk adjustment for sociodemographic factors on quality measures and cost, as well as other strategies for including SDS evaluation in CMS programs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We will closely examine the ASPE studies when they are available and incorporate findings as feasible and appropriate through future rulemaking.

After consideration of the comments and for the reasons we discussed in this final rule with comment period, we are finalizing our policies as proposed.

#### c. Cost

As detailed in the proposed rule, we proposed, consistent with section 1848(q)(9)(A)(i)(II) of the Act, to make all measures under the MIPS cost performance category (see 81 FR 28196) available for public reporting on Physician Compare. This includes all available measures reported via all available submission methods, and applies to both MIPS eligible clinicians and groups.

We have found that cost data do not resonate with consumers and can instead lead to significant misinterpretation and misunderstanding. Therefore, we proposed to include a sub-set of cost measures, that meet the aforementioned public reporting standards, on Physician Compare, either on profile pages or in the downloadable database, if technically feasible (81 FR 28291 through 28292). Statistical testing and consumer testing would determine how and where measures are reported on Physician Compare. In addition, we proposed not to publicly report first year measures, meaning new measures that have been in use for less than 1 year, regardless of submission methods. After a measure's first year in use, we would evaluate the measure to see if and when the measure is suitable for public reporting (81 FR 28292). We requested comments on these proposals.

We also solicited comment on the types of data that should be reported on Physician Compare as the MIPS program evolves, specifically in regard to the cost performance category. Any regulatory changes would be made in separate notice-and-comment rulemaking.

The following is a summary of the comments we received regarding our proposal related

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to public reporting of data from the MIPS cost performance category.

Comment: Some commenters recommended that CMS not publicly report cost measures.

One commenter mentioned that cost data requires other information such as specifics about the patient population served and needs to be reported in the context of other quality measures.

Similarly, another commenter recommended the cost measures not be publicly reported without being risk adjusted and without more information about what portion of a clinician's total patient population is included in the data. Another commenter recommended that cost information not be displayed until CMS develops better, more applicable measures for cost. Other commenters opposed publication because the data do not resonate with consumers and can be misinterpreted and therefore recommended consumer testing on this category to ensure the necessary context is provided so consumers fully understand the information.

Another commenter appreciated the proposal to limit public reporting on the Physician Compare website to a subset of cost measures that meet the public reporting standards, and to include the total number of patients reported on per measure in the downloadable database so that quality data is accurately interpreted per practice size.

Response: We appreciate the commenters' concerns. As explained in this final rule with comment period, we are awaiting ASPE's report on risk adjustment and will evaluate that report with the concerns raised here about patient population variation in mind. The cost measures will be reported in conjunction with performance information for all MIPS performance categories, as technically feasible, which will provide additional context for this information. And, as with all data publicly reported, the measures will only be included on public facing pages if consumer testing shows the measures are accurately interpreted and in fact resonate with consumers.

Therefore, as technically feasible, and based on our statistical public reporting standards and consumer testing we will publicly report cost measures on Physician Compare. We note that we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

intend to make cost data publicly available in the downloadable database, regardless of consumer testing performance, for use in research if it meets our other public reporting standards.

Comment: Some commenters recommended not publicly reporting on new measures for 3 years, noting the data should first be shared only with eligible clinicians and groups before being considered for public reporting so that they could learn from the data in the early years of reporting.

Response: As explained in our discussion about the quality performance category in this final rule with comment period, our experience with public reporting to date has shown that 1 year is generally sufficient and provides adequate time to assess the measure and to provide clinicians and groups an opportunity to gain experience collecting the measure as well as provide feedback to help them improve on the measure before the data are made public. So we do not believe 3 years is needed. Accordingly, we are finalizing a policy not to publicly report first year measures, meaning new measures that have been in use for less than 1 year, regardless of submission methods and performance category as we have generally found 1 year to be sufficient to evaluate new measures. After a measure's first year in use, we will evaluate the measure to see if and when the measure is suitable for public reporting appreciating the concerns raised.

After consideration of the comments and for the reasons we discussed in this final rule with comment period, we are finalizing our policies as proposed. Based on the policies being finalized in II.E.5.e. of this final rule with comment period we may not have data for public reporting in year 1, the transition year, of MIPS for the cost performance category.

#### d. Improvement Activities

As detailed in the proposed rule, we proposed, consistent with section 1848(q)(9)(A)(i)(II) of the Act, to make all activities under the MIPS improvement activities performance category (81 FR 28209) available for public reporting on Physician Compare (81

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

FR 28292). This includes all available improvement activities reported via all available submission methods, and applies to both MIPS eligible clinicians and groups.

We proposed to include a subset of improvement activities data that meet the aforementioned public reporting standards, on Physician Compare, either on the profile pages or in the downloadable database, if technically feasible (81 FR 28292). For those eligible clinicians that successfully meet the improvement activities performance category requirements this may be posted on Physician Compare as an indicator. The improvement activities performance category is a new field of data for Physician Compare so concept and consumer testing will be needed to ensure these data are understood by consumers. Therefore, we proposed that statistical testing and consumer testing would determine how and where improvement activities are reported on Physician Compare. In addition, since we do not publicly report first year measures, we proposed to also apply this policy to improvement activities, meaning new improvement activities that have been in use for less than 1 year, regardless of submission methods. After an improvement activity's first year in use, we would evaluate the activity to see if and when the activity is suitable for public reporting (80 FR 71118). We requested comments on these proposals.

We also solicited comment on the types of data that should be reported on Physician Compare as the MIPS program evolves, specifically in regard to the improvement activities performance category. Any regulatory changes would be made in separate notice-and-comment rulemaking.

The following is a summary of the comments we received regarding our proposal related to public reporting of data from the MIPS improvement activities performance category.

Comment: One commenter recommended that CMS gain experience with the improvement activities category before adding that information to Physician Compare. Other

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenters recommended that improvement activities not be reported on Physician Compare until we performed consumer and statistical testing to validate the category as accurate and ensured the data were being publicly reported with enough context so that consumers accurately interpreted the data. One commenter recommended only including a subset of the improvement activities data on Physician Compare.

Response: We do acknowledge that the improvement activities performance category is a new field of data for Physician Compare so, as noted, concept and consumer testing will be needed to ensure these data are understood by consumers and presented in a way that is easy to understand and with appropriate context. Prior to any data being released on Physician Compare, statistical testing and consumer testing will determine how and where improvement activities are publicly reported and if it is most appropriate to publicly report all available data or only a subset as suggested.

Comment: Some commenters recommended not publicly reporting on new improvement activities for as many as 3 years so there was an opportunity to learn from the measures in the early years of reporting, while other commenters recommended improvement activities data only be shared with eligible clinicians and groups and not be considered for public reporting for at least the first few years if at all.

Response: We are finalizing a policy not to publicly report first year activities, meaning new improvement activities that have been in use for less than 1 year, regardless of submission methods, will not be considered for public reporting. After an improvement activity's first year in use, we will evaluate the activity to see if and when the activity is suitable for public reporting. As 1 year has proven sufficient to understand if quality measures are appropriate and accurate and has provided sufficient time for clinicians and groups to learn from these data, we believe the same will be true for performance activities. However, again, after the first year, we will

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

further review to ensure more time is not needed.

After consideration of the comments and for the reasons we articulated previously, we are finalizing our policies as proposed.

#### e. Advancing Care Information

Since the beginning of the EHR Incentive Programs in 2011, participant performance data has been publicly available in the form of public use files on the CMS website. In the 2015 EHR Incentive Programs final rule, we addressed comments requesting that we not only continue this practice but also include a wider range of information on participation and performance. In that rule, we stated our intent to publish the performance and participation data on Stage 3 objectives and measures of meaningful use in alignment with quality programs which utilize publicly available performance data such as Physician Compare (80 FR 62901). At this time there is only a green check mark on Physician Compare profile pages to indicate that an eligible clinician successfully participated in the current Medicare EHR Incentive Program for eligible clinicians.

As MIPS will now include advancing care information as one of the four MIPS performance categories, we proposed, consistent with section 1848(q)(9)(i)(II) of the Act, to include more information on an eligible clinician's performance on the objectives and measures of meaningful use on Physician Compare (81 FR 28292). An important consideration is that to meet the aforementioned public reporting standards, the data added to Physician Compare must resonate with the average Medicare consumer and their caregivers. Consumer testing to date has shown that people with Medicare value the use of certified EHR technology and see EHR use as something that if used well can improve the quality of their care. In addition, we believe the inclusion of indicators for clinicians who achieve high performance in key care coordination and patient engagement activities provide significant value for consumers.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We therefore proposed to include an indicator for any eligible clinician or group who successfully meets the advancing care information performance category, as detailed in the proposed rule (81 FR 28215), as technically feasible on Physician Compare (81 FR 28292). Also, as technically feasible, we proposed to include additional indicators (81 FR 28292), including but not limited to the indicators specified in section II.E.5.g. of this final rule with comment period such as, identifying if the eligible clinician or group scores high performance in patient access, care coordination and patient engagement, or health information exchange; as further specified in the proposed rule (81 FR 28215). We also proposed that any advancing care information objectives or measures would need to meet the public reporting standards applicable to data posted on Physician Compare, either on the profile pages or in the downloadable database. This would include all available objectives or measures reported via all available submission methods, and would apply to both MIPS eligible clinicians and groups. Statistical testing and consumer testing would determine how and where objectives and measures are reported on Physician Compare. In addition, we proposed to apply our policy of not publicly reporting first year measures (80 FR 71118), meaning new measures that have been in use for reporting for less than 1 year, regardless of submission methods. After a measure's first year in use, we would evaluate the measure to see if and when the measure is suitable for public reporting (81 FR 28292). We requested comment on these proposals.

We also solicited comment on potentially including an indicator to show low performance in the advancing care information performance category, as well as, the types of data that should be reported on Physician Compare as the MIPS program evolves, specifically in regard to the advancing care information performance category. Additionally, we would need to perform consumer testing and evaluate the feasibility of potentially including an indicator to show low performance in the advancing care information performance category to ensure this is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

understood by consumers. Any regulatory changes would be made in separate notice-and-comment rulemaking.

The following is a summary of the comments we received regarding our proposal related to public reporting of data from the MIPS advancing care information performance category.

Comment: A commenter recommended that CMS designate physician performance in the advancing care information category with a green check mark as it has done for the EHR Incentive Program, while some commenters recommended against publicly reporting an indicator for this performance category. One commenter suggested limiting information publicly reported on this category to an indicator showing use of certified EHR technology, generally.

Response: As technically feasible, and based on consumer testing, we will include indicators for the advancing care information performance category on Physician Compare as this is an extension of our existing public reporting related to EHR Incentive Program participation and this information is deemed valuable by consumers and their caregivers. We will use the statistical and consumer testing methods we have adopted for Physician Compare to determine the final presentation and timing of data reported on the website.

Comment: Some commenters recommended not showing low performance in the advancing care information category, which one commenter stated would be confusing to consumers without adequate context. Other commenters recommended not adding an indicator of high performance until the performance score is more refined. Some commenters disagreed with CMS' proposal to include additional indicators, including but not limited to, identifying if the eligible clinician or group scores high performance in patient access, care coordination and patient engagement, or health information exchange. Other commenters noted that continued indication of performance category success is acceptable, but publicly reporting individual

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

metrics within the advancing care information performance category is not. Additional commenters raised concerns about publicly reporting the advancing care information because performance in this category is not solely under the control of the eligible clinician, especially for hospital-based clinicians.

Response: Viewing this as a continuation of our current public reporting, and based on consumer testing, we will include indicators for the advancing care information performance category, as technically feasible. Part of testing is ensuring that the appropriate context is provided for consumers to understand not only all the data points or indicators included, but also the factors that impact performance. This means we will ensure that consumers fully understand individual metrics versus a simple mention of participation success prior to including individual metrics. And, we will evaluate understanding of attribution to ensure certain types of clinicians, specifically hospital-based clinicians, are not unfairly measured. All of these considerations, and the additional concerns raised, will be taken into account and statistical and consumer testing will be done to determine the final presentation and timing of data reported on the website.

Comment: Some commenters recommended not publicly reporting on new measures for as many as 3 years, and first only sharing this information with the eligible clinicians and groups until they gain experience with the measures and learn from the measures in the early years of public reporting.

Response: As previously noted, under existing programs 1 year has proven sufficient for evaluating the measure for public reporting, so we do not believe using a longer time frame of 3 years is necessary. Accordingly, we are finalizing a decision not to publicly report first year measures or indicators, meaning new measures or indicators that have been in use for reporting for less than 1 year, regardless of submission methods. After a measure or indicator's first year in use, we will evaluate the measure or indicator to see if and when the measure or indicator is

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

suitable for public reporting.

Comment: One commenter requested that CMS indicate a disclaimer on the clinician's profile if they were exempt from participating in the advancing care information performance category.

Response: We will evaluate the need for including disclaimers based on the final data available for public reporting and consumer testing.

After consideration of the comments and for the reasons we discussed in this final rule with comment period, we are finalizing our policies as proposed.

#### f. Utilization Data

We previously finalized a policy to include utilization data in the Physician Compare downloadable database in late 2017 using the most currently available data (80 FR 71130) to meet section 104(e) of the MACRA. As there are thousands of Healthcare Common Procedure Coding System (HCPCS) codes in use, not all available data will be included. The specific HCPCS codes included will be determined based on analysis of the available data, focusing on the most used codes. The goal will be to include counts that can facilitate a greater understanding and more in-depth analysis of the other measure and performance data being made available. We proposed to continue to include utilization data in the Physician Compare downloadable database (81 FR 28292). We requested comment on this proposal.

The following is a summary of the comments we received regarding our proposal to continue to include utilization data in the Physician Compare downloadable database.

Comment: Some commenters supported including utilization data in the downloadable database, though one commenter suggested CMS make the specific HCPCS codes included available for public comment. One commenter recommended that CMS implement precautions such as including only aggregated data in the downloadable database or making this information

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

available only to professional societies, citing concern that without explanation this data could be misleading. Other commenters recommended CMS only publicly report data suitable for an eligible clinicians profile page noting that if it can be misinterpreted by consumers, it may be misused by other stakeholders. Another commenter recommends that CMS provide a disclaimer regarding the limits of utilization data.

Response: To satisfy section 104(e) of the MACRA, we implemented a policy to begin to include utilization data in the Physician Compare downloadable database in late 2017 using the most currently available data, and previously finalized the specific codes to be included would be determined via data analysis, and reported at the eligible clinician level (80 FR 71130). We proposed to continue this policy of reporting utilization data. Given that section 104 of the MACRA requires the utilization data to be searchable by specialty, characteristics of services, and location of eligible clinician, we believe it is necessary to report the data un-aggregated. Aggregated data are available at <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/Medicare-Provider-Charge-Data/Physician-and-Other-Supplier2014.html>. Given the audience of the downloadable database is predominantly the professional community and third-party data users, we believe the data are appropriate for inclusion in the downloadable database. The audience for the public facing profile pages and the use of the information on those pages is significantly different. We will take recommendations to add additional context and disclaimers around the use and limits of the utilization to the downloadable database data dictionary under consideration.

After consideration of the comments and for the reasons we articulated, we are finalizing the policy as proposed.

g. APM Data

As discussed above, section 1848(q)(9)(A)(ii) of the Act requires us to publicly report

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

names of eligible clinicians in Advanced APMs and, to the extent feasible, the names and performance of Advanced APMs. We see this as an opportunity to continue and build on reporting we are now doing of ACO data on Physician Compare. At this time, if a clinician or group submitted quality data as part of an ACO, there is an indicator on the clinician's or group's profile page indicating this. In this way, it is known which clinicians and groups took part in an ACO. Also, currently, all ACOs have a dedicated page on the website to showcase their data. If technically feasible, we proposed to use this model as a guide as we add APM data to Physician Compare. We proposed to indicate on eligible clinician and group profile pages when the eligible clinician or group is participating in an APM (81 FR 28293). We also proposed to link eligible clinicians and groups to their APM's data, as relevant and possible, through Physician Compare. Data posting would be considered for both Advanced APMs and APMs that are not considered Advanced APMs.

At the outset, APMs will be very new concepts for consumers. Testing shows that at this time, ACOs are not a familiar concept to the average Medicare consumer. It is very easy for consumers to misunderstand an ACO as just a type of group. We expect at least the same lack of familiarity when introducing the broader concept of APM, of which ACOs comprise only one type. In these early years, indicating who participated in APMs and testing language to accurately explain that to consumers provides useful and valuable information as we continue to evolve Physician Compare. As we come to understand how to best explain this concept to consumers, we can continue to assess how to most fully integrate these data on the website. We requested comment on these proposals.

The following is a summary of the comments we received regarding our proposal to publicly report names of eligible clinicians in Advanced APMs and, to the extent feasible, the names and performance of Advanced APMs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Commenters supported CMS' proposal to use the current approach for reporting ACO involvement as a model for reporting APM involvement, and one commenter supported publicly reporting APM data at the individual eligible clinician level. Another commenter noted the importance of gradually integrating the APM data onto Physician Compare agreeing this is a new concept for consumers that will need to be fully explained. Some commenters did express concern that APM information may be difficult for consumers to understand, and one commenter suggested CMS provide additional contextual information including how the APM is structured and how APM structure influences comparability.

Response: We agree using the ACO reporting model is a beneficial approach, and we support the gradual integration of the APM data onto Physician Compare as informed by consumer testing. This will ensure the information is presented in a way that is accurately interpreted and most beneficial to consumers. We will take recommendations to add additional contextual information into consideration as we work to include this information on the website.

Comment: One commenter asked for clarification as to how CMS will prevent the display of APM data on Physician Compare from giving APM participants an advantage over MIPS participants.

Response: We do not believe that one type of data provides an advantage over the other based on consumer understanding of the information currently available. Testing shows that consumers do prefer data at the individual eligible clinician level over data aggregated to the group or ACO level, but they find value in all data presented. We will keep this concern in mind as we continue to test APMs with consumers, however.

After consideration of the comments and for the reasons we set forth, we are finalizing this policy as proposed.

#### h. Miscellaneous Comments

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Some of the comments received did not specifically relate to the public reporting proposals in the proposed rule. The following is a summary of these miscellaneous comments.

Comment: A commenter supported including the number of patients reported per measure in the downloadable database. Another commenter stated that if QCDRs are going to take on a more important role in the Quality Payment Program, CMS should set better standards with regard to the public reporting of QCDR data and the issue of non-MIPS quality measures. One commenter recommended that Physician Compare have quality measures that reflect the physicians' specific contributions to patient care and outcomes, which emphasize the team-based approach that certain specialties take, such as palliative care. One commenter recommended publicly reporting performance information only if eligible clinicians can have an assurance that their reported data is normalized and comparable. This commenter opposed publicly reporting performance information otherwise. One commenter recommended providing educational tools for patients viewing Physician Compare. This commenter believed that this will enable patients who view eligible clinicians on Physician Compare to note when a physician could not participate in a specific performance category listed.

One commenter supported the inclusion of ABMS board certification and participation in Maintenance of Certification (MOC) Programs on Physician Compare. Another commenter recommended MOC participation as a measure in future rulemaking as part of quality performance data publicly reported on Physician Compare.

One commenter believed that payers, providers, large group purchasers, and consumers should be fully empowered to access, use, share, contribute, and benefit from data that improve their health care decision making. Another commenter recommended including Medicare Advantage plan quality information that is comparable to FFS information on Physician Compare. One commenter recommended that Physician Compare provide comparative quality

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

information and comparative pricing data across services; estimated costs for in network and out of network costs; allow consumer to customize the provider information to highlight the most relevant information; expand provider information to include the most relevant topics for consumers, such as patient-reported outcome measures; online decision-support tools, as well as assistive and cognitive technology tools.

One commenter recommended CMS provide a method for comparing IHS, Tribal, and urban Indian providers. The commenter also recommended that CMS remain aware of these providers as distinct when collecting and reporting data.

One commenter recommended providing a disclaimer that publicly reported final scores are not admissible judicially. Another commenter recommended a disclaimer on Physician Compare that performance information should not be used to determine whether an act of medical negligence has occurred.

One commenter recommended that CMS provide a disclaimer where insufficient performance data exists on Physician Compare which explains why certain eligible clinicians do not have data publicly reported. Another commenter recommended that CMS indicate whether an eligible clinician has been excluded from reporting data so consumers do not potentially misinterpret limited performance data on the eligible clinicians profile page.

Response: We appreciate the points, concerns, and suggestions raised by commenters and, if feasible and appropriate under the statute, we may possibly consider these issues in future rulemaking.

Comment: One commenter supported allowing QCDRs to publicly report their performance data on their website. One commenter asked whether CMS will post all QCDR performance data on Physician Compare or allow QCDRs to post their performance data on their website. Another commenter recommended that QCDRs be able to provide a link to an external

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

site that publicly reports information on clinicians associated with that QCDR.

Response: To note current policies that will be carried forward under MIPS, QCDRs can choose to report their unique measures on their own website and provide a link for Physician Compare to include or on Physician Compare profile pages. All data that meet public reporting standards are included in the downloadable database, however.

Comment: One commenter asked CMS to clarify the process for how partial data submission during a performance period is publicly reported on Physician Compare. Another commenter recommended publicly reporting eligible clinicians who report fewer than the required number of quality measures along with their reasoning for doing so. This commenter believes this will increase transparency.

Response: To note current policies that will be carried forward under MIPS if feasible and appropriate, each measure submitted is evaluated on a measure-by-measure basis. If the specific measure meets all public reporting standards, it will be publicly reported even if the eligible clinician, for example, is not a satisfactory reporter under PQRS (for example, the clinician did not satisfactorily report 9 measures across 3 domains). As a result, clinicians that report partial data do have data included on Physician Compare.

Comment: One commenter recommended CMS provide a method for comparing IHS, Tribal, and urban Indian clinicians. The commenter also recommended that CMS remain aware of these clinicians as distinct when collecting and reporting data.

Response: We appreciate the points, concerns, and suggestions raised by the commenter and, if feasible and appropriate under the statute, we may possibly consider these issues in future rulemaking and will conduct tribal consultation with tribes and tribal officials, as feasible and appropriate.

Comment: Many commenters supported information that is publicly reported be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

statistically valid, reliable, scientifically based, and/or meaningful to consumers and eligible clinicians and request CMS focus on ensuring the data on Physician Compare are as accurate, reliable, and representative as possible. They also requested adequate disclaimers when there are limitations to the available data or questions about their completeness. Commenters also encouraged CMS to ensure the data included on Physician Compare are clear and useful to consumers. One commenter was concerned with inaccurate data being reported on Physician Compare, and recommended publishing MIPS data with an adequate description of the program including eligibility rules. Another commenter expressed some concern with the accuracy of the information and its usefulness for consumers.

One commenter recommended a principal focus be on providing reliable and useful data rather than expediency.

Response: We appreciate your comments and remain dedicated to publicly reporting data that generally meet public reporting standards.

Comment: One commenter recommended that updates in PECOS be updated on Physician Compare within a short time frame, such as 30 days.

Response: Data are refreshed on Physician Compare bi-weekly. Edits to PECOS do take longer to be reflected on the site as a result of the time it takes for MACs to review and verify information as needed. We are continually working to improve this timeline.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

## F. Overview of Incentives for Participation in Advanced Alternative Payment Models

Section 1833(z) of the Act, as added by section 101(e)(2) of the MACRA, requires that an incentive payment be made to Qualifying APM Participants (QPs) for participation in eligible alternative payment models (referred to as Advanced APMs). Key statutory elements of the incentives for participation in Advanced APMs under the Quality Payment Program addressed in the proposed rule include:

- Beginning in 2019, if an eligible clinician participates in a certain type of APM (an Advanced APM), that eligible clinician may become a QP. Eligible clinicians who become QPs are excluded from MIPS.
- For years from 2019 through 2024, QPs receive a lump sum incentive payment equal to 5 percent of their prior year's payments for Part B covered professional services, and beginning in 2026, QPs receive a higher update under the PFS than non-QPs.
- For 2019 and 2020, eligible clinicians may become QPs only through participation in Advanced APMs.
- For 2021 and later, eligible clinicians may become QPs through a combination of participation in Advanced APMs and Other Payer Advanced APMs.

This section of the rule discusses public comments and finalizes the definitions, requirements, procedures, and thresholds of participation that will govern this program.

### 1. Policy Principles

Several core policy principles are derived from both the MACRA law and the Department's broad vision for better care, smarter spending, and healthier people. These principles drive many of our decisions in developing the overall framework for making APM Incentive Payments to QPs and for approaching interactions between MIPS and APMs discussed in the proposed rule. In addition to increasing the quality and efficiency of care delivered in the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medicare program and across the health system, these principles include the following seven goals:

- To the greatest extent possible, continue to build a portfolio of APMs that collectively allows participation for a broad range of physicians and other practitioners. We believe finding better ways to deliver care across settings and specialties can lead to improved health outcomes and more efficient health care spending. Doing this requires active CMS engagement with stakeholders, as well as input from those stakeholders to refine ideas in ways that meet statutory and delivery system reform goals.

- Design the program such that the APM Incentive Payment is attainable by increasing numbers of Advanced APM participants over time, yet remains reserved for those eligible clinicians participating in organizations that are truly engaged in care transformation. We believe the structure of the law is clear in that the APM Incentive Payments are earned through participation in APMs that are designed to be challenging and involve rigorous care improvement activities. In general, we believe eligible clinicians that receive incentives should be those who: take on financial risk for potential losses under an APM; are accountable for performance based on meaningful quality metrics; and use certified EHR technology.

- Maximize participation in both Advanced APMs and other APMs. Although we want to maintain high standards for eligible clinicians to earn the APM Incentive Payment, we also want to enable and encourage high levels of participation in a broad range of APMs, including those that are not Advanced APMs. We believe participation in any APM offers eligible clinicians and beneficiaries significant benefits.

- Create policies that allow for flexibility in future innovative Advanced APMs. We do not want to constrain the robust development of new Advanced APMs by framing standards only

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

in terms of today's APMs but rather in ways that allow many avenues for meeting the Advanced APM criteria.

- Support multi-payer models and participation in innovative models in Medicaid and commercial markets in order to promote high quality and efficient care across the health care market.

- Minimize burden on organizations and professionals. Between APM participation and MIPS reporting, we hope to coordinate administrative processes, minimize overall reporting burden, and make transitioning between being a QP and being subject to MIPS as seamless as possible.

- We do not intend to create additional performance assessments or audits beyond those specified under an APM. Rather, we believe the process for determining whether an eligible clinician receives the APM Incentive Payment should focus on the relative degree of participation by eligible clinicians in Advanced APMs, not on their performance within the APM. The Quality Payment Program does not alter how each particular APM measures and rewards success within its design. Rather, it rewards a substantial degree of participation in certain APMs.

## 2. Overview of Proposed APM Policies

The incentives for Advanced APM participation established by the statute include several sets of related requirements that must be met. Three distinct roles play important parts in the program structure: (1) the Advanced Alternative Payment Model (Advanced APM), which is a health care payment and/or delivery model that includes payment arrangements and other design elements as part of a particular approach to care improvement and that by its design satisfies the criteria set forth in section 1833(z) of the Act; (2) the Advanced APM Entity, which is the entity participating in the Advanced APM; and (3) the eligible clinician, who is the individual

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

physician or practitioner, or group of physicians or practitioners, who is a participant of the Advanced APM Entity and may be determined to be a QP.

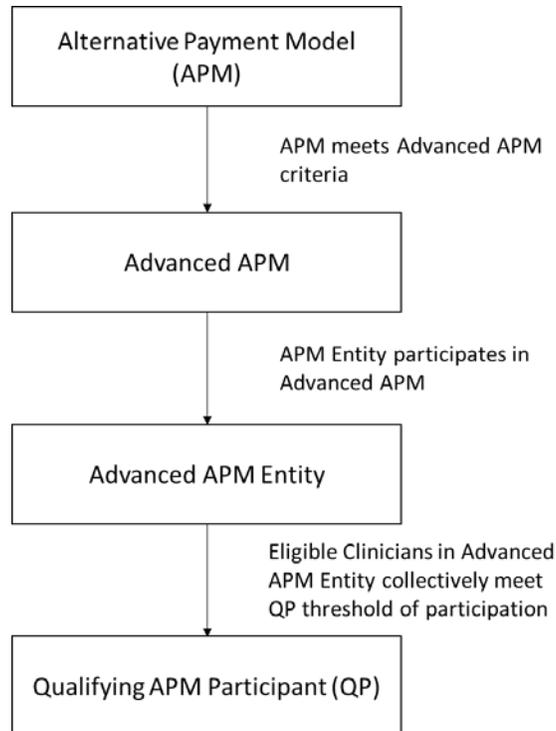

In this final rule with comment period, we describe a series of steps that result in the determination of certain eligible clinicians as QPs for a particular year (the payment year). QPs will receive the APM Incentive Payment as specified in section 1833(z) of the Act for each of the years they qualify from 2019 through 2024, and the differential update incentive in section 1848(d)(20) of the Act for each of the years they qualify beginning in 2026. Per section 1833(z)(1)(A) of the Act, the APM Incentive Payment that an eligible clinician receives as a QP for a year between 2019 and 2024 is a lump sum payment equal to 5 percent of the QP's estimated aggregate payments for Medicare Part B covered professional services (services paid under or based on the Medicare PFS) for the prior year. Eligible clinicians who are QPs for a year are also excluded from MIPS for that year. In addition, beginning in 2026, QPs receive a higher Medicare PFS update (the "qualifying APM conversion factor") than non-QPs. This QP determination is made for one calendar year at a time.

The steps that will result in a QP determination can be summarized as follows: (1) we determine whether the design of an APM meets three specified criteria for it to be deemed an Advanced APM; (2) an entity (the Advanced APM Entity) with a group of individual eligible clinicians participates in the Advanced APM; (3) we determine whether, during a performance period (the QP Performance Period), the eligible clinicians in the Advanced APM Entity collectively have at least a specified percentage of their aggregate Medicare Part B payments for covered professional services, or patients who received covered professional services, through the Advanced APM; (4) all of the eligible clinicians in the Advanced APM Entity are designated QPs for the payment year associated with that QP Performance Period. Those QPs would receive the 5 percent lump-sum APM Incentive Payments mentioned above for the payment year. This

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

QP determination process would occur each year following the QP Performance Period, with the first payment year being 2019. Figure B illustrates the stages of determinations that result in QP determinations.

**FIGURE B: Program Overview**

The following is a summary of the comments we received generally regarding the incentives for participation in Advanced APMs.

Comment: Some commenters expressed support for the policy principles and goals for Advanced APMs. Many commenters expressed a desire for more opportunities to participate in Advanced APMs. Many commenters specifically called for new Advanced APMs that focus on small or rural practices or specialty practices such as surgery, emergency medicine, dentistry, or long-term care. Some commenters suggested focusing on specific beneficiary populations. Other commenters expressed support for transitional pathways to Advanced APM participation, and changes to existing APMs both in order to change them into Advanced APMs and make them

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

more accessible to new participants.

Some commenters appreciated that the inception of this part of the Quality Payment Program will serve as a catalyst for more Advanced APMs and an acceleration of the movement from volume- to value-based payment. One commenter expressed concern that the process used to create and approve new Advanced APMs is too slow. One commenter expressed concern that because QPs in an Advanced APM Entity can earn the 5 percent APM Incentive Payment without demonstrating improved quality, controlled cost, or both, there will be no change to health care delivery, and that clinicians would not have a strong incentive to change their practice patterns. One commenter recommended CMS evaluate its overall approach and perhaps abandon Advanced APMs.

Response: We agree with commenters that it is paramount for us to develop and offer more Advanced APM opportunities in the future. In order to increase participation in both APMs and Advanced APMs, we recognize that we must strive to create offerings for clinicians across the entire care continuum and across geographic regions.

We plan to achieve these goals in the immediate and long-term future by expanding opportunities for clinicians to participate in existing Advanced APMs, changing certain existing APMs to meet the Advanced APM criteria, and developing new Advanced APMs, especially based on recommendations from the PTAC. The PTAC is discussed in section II.F.10. of this final rule with comment period. We note that not all models that are derived from PTAC recommendations must be Advanced APMs.

The incentives for Advanced APM participation, as specified under section 1833(z) of the Act, do not provide for consideration of eligible clinicians' performance in terms of quality, cost, or other factors in making determinations as to whether eligible clinicians are QPs for a year. However, we believe the performance requirements that are applicable to eligible clinicians

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

under each Advanced APM will incentivize participants to make improvements in care delivery so as to improve quality of care and reduce expenditures. Additionally, the Transforming Clinical Practice Initiative (TCPI) is a \$685 million CMS Innovation Center initiative designed to support 140,000 clinicians in sharing, adopting, and further developing comprehensive quality improve strategies, which are expected to lead to greater improvements in patient health and reduction in health care costs.

In regard to the request for transitional pathways to Advanced APM participation, section 1848(q)(11) of the Act provides \$100 million in funding over 5 years for CMS to provide technical assistance to help clinicians develop the capabilities to be successful in the Quality Payment Program. These technical assistance efforts will target eligible clinicians in individual or small group practices of 15 or fewer, focusing on those practicing in rural areas, health professional shortage areas (HPSAs), and medically underserved areas (MUAs), as well as practices with low composite scores under the MIPS.

The planned technical assistance will support small practices by helping them think through what they need to be successful under the Quality Payment Program, such as what quality measures and/or EHR may be appropriate for their practices' needs. The planned technical assistance would also educate clinicians about clinical practice improvement activities and how these activities could fit into their practices' workflow, or help practices evaluate their options for joining an APM. We believe this technical assistance, combined with our continued outreach and education efforts, will provide substantial support to eligible clinicians in their transition into APMs and Advanced APMs.

### 3. Terms and Definitions

The APM track of the Quality Payment Program uses a set of interrelated defined terms. The basis for some core terms are set forth at sections 1833(z)(3) and 1848(q)(1)(C)(iii) of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Act, and others we will define in this final rule with comment period.

We use the statutory text as a foundation to develop definitions for other key terms used in this final rule with comment period. The terms cover three primary topics: (1) The different types of APMs and their participating entities and clinicians; (2) the timing, process and thresholds for determining QPs and Partial Qualifying APM Participants (Partial QPs); and (3) the payment of the 5 percent lump sum incentive (APM Incentive Payment) to QPs.

We are finalizing definitions for the following terms specific to incentives for participation in Advanced APMs, which are located at §414.1302 of new subpart O:

- Affiliated Practitioner.
- APM Entity.
- APM Incentive Payment.
- Attributed beneficiary.
- Attribution-eligible beneficiary.
- Alternative Payment Model (APM).
- Advanced Alternative Payment Model (Advanced APM).
- Advanced APM Entity.
- Eligible clinician.
- Episode payment model.
- Incentive Payment Base Period.
- Medicaid APM.
- Medicaid Medical Home Model.
- Medical Home Model.
- Other Payer Advanced APM.
- Other payer arrangement.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Partial Qualifying APM Participant (Partial QP).
- Partial QP Patient Count Threshold.
- Partial QP Payment Amount Threshold.
- Qualifying APM Participant (QP).
- QP Patient Count Threshold.
- QP Payment Amount Threshold.
- QP Performance Period.
- Threshold Score.

a. Definitions of APM Entity and Advanced APM Entity

The MACRA uses the term “Eligible APM” in the heading for section 1833(z) of the Act, in section 1848(q)(9)(A)(ii) of the Act, and indirectly defines it at section 1833(z)(3)(D) of the Act as the APM in which “eligible alternative payment entities” participate. We have decided to use the term “Advanced” in lieu of “Eligible,” for those APMs defined by section 1833(z)(3)(C) of the Act that meet the criteria under section 1833(z)(3)(D) of the Act. Rather than referring indirectly, as is done in section 1833(z)(3)(D)(i) of the Act, to the APM in which an eligible alternative payment entity participates, we believe it is essential to the understanding of this final rule with comment period to be able to identify and finalize requirements directly for an Advanced APM.

Similarly, we proposed to use the term “Advanced APM Entity” instead of “alternative payment entity” because it highlights the connected but different roles of the Advanced APM (for example, a CMS Innovation Center ACO model meeting specified criteria) and the Advanced APM Entity (for example, a specific ACO participating in that ACO model). We also believed that it was important to the clarity of the proposed rule to define “APM Entity” in addition to “Advanced APM Entity” so that we can easily distinguish between the two under

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

both MIPS and the APM incentives. We proposed that an APM Entity is an entity that participates in an APM or Other Payer APM through a direct agreement with CMS or a non-Medicare other payer, respectively. These APM Entities will be primarily responsible for the cost and quality of care provided to beneficiaries through the APM. The term “eligible alternative payment entity” (which we refer to as an “Advanced APM Entity”) is defined under section 1833(z)(3)(D) of the Act. We proposed that an Advanced APM Entity is an APM Entity that participates in an Advanced APM that, through terms of a direct agreement with CMS or through federal law or regulation, meets the criteria finalized in this rule.

The following is a summary of the comments we received regarding our proposed definitions of the terms APM Entity and Advanced APM Entity.

Comment: Commenters noted that a direct CMS agreement is not necessarily the operative legal instrument for entities to participate in APMs. They were concerned that the proposed definition would inadvertently prevent APM Entities from being considered Advanced APM Entities. One commenter stated concern that hospitalists would not be included under this definition of APM Entity and supported a more inclusive definition. One commenter disliked the set of terms related to APMs, such as Advanced APMs, APM Entities, and Other Payer Advanced APMs, and believed they were unclear. Another commenter stated that the definition of APM Entity was too restrictive, and requested that CMS expand it to include any entity that executed a Participation Agreement. One commenter criticized the use of the term Advanced APM and suggested that we use either Qualifying APM or Eligible APM.

Response: We appreciate the attention to the definitions and agree that the definitions of APM Entity and Advanced APM Entity should not be a barrier to eligible clinicians becoming QPs, but rather descriptors of the entities that are participating in APMs and Advanced APMs, respectively. We believe that the proposed terms clearly distinguish each while showing the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

relationship between the terms, such as how an APM Entity participates in an APM. We understand that “qualifying” or “eligible” could also have been used in the definitions because these are used in the statute. However, we chose “Advanced APM” because we believe it reflects the element of additional rigor relative to APMs, allowing the term to serve as a meaningful descriptor of a certain type of APM.

We are modifying our proposed definition of APM Entity to no longer require a direct agreement with CMS in all cases. Instead, we are defining APM Entity to mean an entity that participates in an APM or payment arrangement with CMS or another payer, respectively, through a direct agreement with CMS or the other payer, or through federal or state law or regulation. We are also finalizing the definition of Advanced APM Entity to mean an APM Entity that participates in an Advanced APM or Other Payer Advanced APM with CMS or a non-Medicare other payer, respectively, through a direct agreement with CMS or the payer or through federal or state law or regulation. We note that we determine whether an APM is an Advanced APM or a payment arrangement is an Other Payer Advanced APM consistent with the criteria finalized in this final rule with comment period.

These changes are important because some APMs define participation through a voluntarily signed agreement whereas other APMs may define participation through rulemaking or based on federal or state statutory requirements. For example, the CJR model defines participant hospitals (the APM Entities) in regulation based on their geographic location in specified Metropolitan Statistical Areas (MSAs). These definitions ensure that entities participating in APMs and Advanced APMs by various binding legal means are included in the definitions of APM Entity and Advanced APM Entity, respectively.

#### b. Definitions of Medical Home Model and Medicaid Medical Home Model

We also proposed to define the terms “Medical Home Model” and “Medicaid Medical

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Home Model” as subsets of APMs and Other Payer APMs, respectively. The MACRA does not define “medical homes” but sections 1848(q)(5)(C)(i), 1833(z)(2)(B)(iii)(II)(cc)(BB), 1833(z)(2)(C)(iii)(II)(cc)(BB), and 1833(z)(3)(D)(ii)(II) of the Act make medical homes an instrumental piece of the law.

We note that medical homes would be the APM Entities in an APM, not the APM itself. The requirements in the MACRA and in this final rule with comment period actually relate to the disposition of the APM, not the participating APM Entities. For instance, as described in section II.F.4.b.(6) of this final rule with comment period, section 1115A(c) of the Act relates to the expansion of models (APMs), not the participants (APM Entities) of such models. APM participants are not expanded under section 1115A(c) of the Act. Therefore, we discuss medical homes in terms of the Medical Home Model, which is the concept to which the MACRA and this final rule with comment period actually refer. Although the definitions are identical but for their payer context, we distinguish Medicaid Medical Home Models because there are specific requirements for them under the determination of Other Payer Advanced APMs as described in section II.F.7.b.(3) of this final rule with comment period.

We proposed that a Medical Home Model must have the following elements:

- Model participants include primary care practices or multispecialty practices that include primary care physicians and practitioners and offer primary care services.
- Empanelment of each patient to a primary clinician.

In addition to these elements, we proposed that a Medical Home Model must have at least four of the following elements:

- Planned coordination of chronic and preventive care.
- Patient access and continuity of care.
- Risk-stratified care management.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Coordination of care across the medical neighborhood.
- Patient and caregiver engagement.
- Shared decision-making.
- Payment arrangements in addition to, or substituting for, FFS payments (for example, shared savings or population-based payments).

The two required elements are consistent with the fundamental characteristics of medical homes in the various incarnations and accreditation standards across the health care market. Therefore, we believe that an APM cannot be a Medical Home Model unless it has a primary care focus with an explicit relationship between patients and their practitioners. To determine that an APM has a primary care focus, we proposed that the Medical Home Model will have to involve specific design elements related to eligible clinicians practicing under one or more of the following Physician Specialty Codes: 01 General Practice; 08 Family Medicine; 11 Internal Medicine; 37 Pediatric Medicine; 38 Geriatric Medicine; 50 Nurse Practitioner; 89 Clinical Nurse Specialist; and 97 Physician Assistant. We solicited comment on whether this proposal for determining that an APM has a primary care focus is sufficiently specified.

We believe the optional elements should be present in Medical Home Models, but individually, each is less definitive of a characteristic than the two required elements. We also want to adhere to our principle of supporting future flexibility of APM design. Extensive rigid Medical Home Model criteria would not serve the purpose of promoting the development of new and potentially better ways of managing patient care through primary care.

We solicited comment on these elements and which of the elements should be required as opposed to optional. Our proposed definition of Medicaid Medical Home Model is identical to Medical Home Model, except that it specifically describes a payment arrangement operated by a State under title XIX. It is important to separate the terms because Medicaid Medical Home

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Models have distinct implications in the Other Payer Advanced APM determination and the QP determination under the All-Payer Combination Option.

The following is a summary of the comments we received regarding our proposed definitions of the terms Medical Home Model and Medicaid Medical Home Model.

Comment: Several commenters addressed the terms used to describe Medical Home Models, and supported the proposed definitions. One commenter supported CMS' classification of a medical home as an "entity" rather than as a "model." One commenter recommended that CMS alter the term "medical home" to "medical home entity" to clarify that it is a TIN or collection of TINs that is an accountable unit within the Medical Home Model. This same commenter also suggested creating two new terms: "Advanced Medicaid Medical Home Model" and "Other Payer Advanced Medical Home Model." One commenter suggested it makes more sense to name Medical Home Models "Primary-Care Focused Models" and incorporate the term in the proposed required elements.

Response: We thank commenters for their attention to this definition. We believe that the term "Medical Home Model" best reflects the intent of the statute's use of the term medical homes expanded under section 1115A(c) of the Act as specified in section 1833(z) of the Act. We believe it makes the most sense, in context, to read the statutory references to "medical home" to identify a specific type of APM that potentially could be expanded, rather than to refer to an entity made up of eligible clinicians and other health care providers that would participate in an APM. That is why we proposed to define "Medical Home Model" as the APM and "APM Entity" as the participants in APMs. We use the term APM Entity as a general term to describe all entities that are participants in APMs and, except when it is expedient to implement statutory requirements, we do not believe we should create additional terms to describe subcategories of APM Entities as multiple terms could create confusion. Similarly, we believe that the terms

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medical Home Model and Medicaid Medical Home Model provide sufficient clarity for purposes of implementing the statute, and that creating additional definitions may create confusion.

Comment: Several commenters addressed how we define primary care as part of a Medical Home Model and a Medicaid Medical Home Model. One commenter agreed with our proposal to require a primary care focus as an essential requirement for Medical Home Models and encouraged CMS to additionally require that Medical Home Model participants be primary care medical home practices or multi-specialty practices that offer primary care, and empanelment of each patient to a primary care physician. The same commenter encouraged CMS to include in the optional elements for a Medical Home Model: whole person orientation, quality and safety.

In addition, the commenter expressed concern with our proposal to include certain eligible clinicians within Medical Home Models, as they are not always primary care practitioners, that is, 50 Nurse Practitioner; 89 Clinical Nurse Specialist; and 97 Physician Assistant. One commenter wanted more information on the licensing description for each category of eligible clinician and more information on the list of physician specialty codes. Another commenter sought clarification on whether or not the code for Nurse Practitioners includes all Nurse Practitioner codes or if the APM should specify codes for certain primary care certifications, and another commenter recommended that codes for family nurse practitioners, geriatric nurse practitioners, adult nurse practitioners, and others be included. A few other commenters recommended that CMS add code "16 Obstetrics and Gynecology" to the list of specialties that we would use to determine a primary care focus in a Medical Home Model. One commenter requested that occupational therapists to be considered a required component of any Medical Home Model. Another commenter suggested that behavioral health organizations be included in the definition of Medical Home Model. Some commenters requested clarification

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

regarding the definition of “parent organization” and “empanelment” as it relates to Medical Home Models.

A few commenters recommended CMS to broaden its definition of a Medical Home Model to include APMs that focus on specialty care. Another commenter suggested CMS to include specialist-focused Medical Home Models as a viable option for qualifying as an Advanced APM regardless of risk, much like it proposed for primary care-focused Medical Home Models. One commenter appreciated that CMS provided for elements such as continuity of care, coordination of chronic and preventive care, and coordination across the medical neighborhood, which will assist multispecialty practices when seeking to participate in an Advanced APM, but believed the definition we proposed for a Medical Home Model would largely exclude specialty-focused models. An additional commenter requested CMS to consider adding additional specialties to the approved list of Physician Specialty Codes to whom the patient may be assigned within the Medical Home Model. Another commenter expressed concern that Medicaid Medical Home Models might be prohibited from empaneling patients to any specialists, and one other commenter suggested that we add to the definition of Medical Home Models as a requirement the attribution of patients to specialists. One commenter suggested we address the special needs of children as a requirement in our definition. Another commenter requested information clarifying the relationship between the Medical Home Model definition and certified patient-centered medical home, and asked whether patient-centered medical home certification is a requirement to be considered a Medical Home Model.

Response: We appreciate commenters’ input and will consider the suggestions for future rulemaking applicable to performance periods after 2017. We believe that the proposed definition is sufficient to identify Medical Home Models that might be in place for the 2017 QP

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Performance Period. However, we are modifying the proposed definition to emphasize the primary care focus. We note that because a Medical Home Model is a type of APM, having a primary care focus means that there are specific design elements that target eligible clinicians with the specified specialty codes. We are also adding code "16 Obstetrics and Gynecology" to the list of specialty codes that we will use to determine primary care focus because we agree with the commenter that these physicians often coordinate primary care services for women.

We clarify that the definition of Medical Home Model does not include a requirement for patient-centered medical home certification. A certified patient-centered medical home is a practice-level designation, whereas a Medical Home Model is a type of APM (a payment model) defined in this final rule with comment period.

We believe that empanelment is a commonly understood term used in existing APMs and primary care practices that does not need to be defined in this rulemaking. We believe that empanelment methodologies are specific to each Medical Home Model, and we do not want to unduly restrict APM design flexibility by prescribing how and to whom empanelment may be done. Although we note that Medical Home Models must have a primary care focus, we do not specify that empanelment in a Medical Home Model must be only to primary care practitioners. Finally, we discuss the meaning of "parent organization" in section II.F.4.b.(4) of this final rule with comment period in the context of the Advanced APM financial risk criterion.

Comment: One commenter encouraged CMS to move towards measuring whether meaningful shared decision-making has occurred, specifically through patient-reported measures. This commenter also requested that CMS establish clear standards for practices to ensure that clinicians have the skills and training to furnish shared decision-making services at a high level of quality and to effectively use shared decision making tools. In addition, commenters recommended that shared decision-making be re-framed as an integral part of "shared care

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

planning" which occurs across a patient's lifespan rather than in a single episode of care and consisted of two key elements: (1) patients faced with a treatment decision must be informed about all the reasonable options, including doing nothing, and told what is known about the potential risks, benefits and alternatives to those options; and (2) patients must be meaningfully involved in the decision making process. A few commenters suggested CMS require that all seven criteria must be met for an APM to be a Medical Home Model or a Medicaid Medical Home Model, and one of these commenters suggested CMS should define activities that demonstrate how those criteria can be satisfied. The same commenter also recommended adding an eighth element related to coordinating delivery of care with other services that address social determinants of health.

Response: We thank the commenters for their suggestions. We believe that the suggestions may prove to be too prescriptive when setting standards that apply across many APMs, and we are concerned that imposing additional requirements would contradict our principle of supporting APM flexibility. For instance, we could develop an APM that addresses social determinants of health, but requiring social determinants of health to be an element of an APM in order for it to be considered a Medical Home Model would be so strict as to exclude as Medical Home Models APMs that are widely available or focused on discrete care improvement goals. Therefore, we continue to believe that defining Medical Home Model to require a small set of core characteristics of medical home homes, along with a flexible set of additional characteristics, is the appropriate approach to maintain our principle to support APM flexibility. Defining Medical Home Model this way will allow for the inclusion of additional elements when actually creating a Medical Home Model to customize the APM for testing particular ways to improve the cost and quality of care.

We are finalizing the definitions of Medical Home Model and Medicaid Medical Home

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Model with modifications to emphasize the requirement that the APM have a primary care focus, clarify the required versus additional elements, and add Obstetrics and Gynecology (specialty code 16) as a primary care specialty. We are finalizing the definitions as follows:

A Medical Home Model or Medicaid Medical Home Model is an APM or payment arrangement under title XIX, respectively that we determine to have the following required elements:

- Primary care focus with participants that include primary care practices or multispecialty practices that include primary care physicians and practitioners and offer primary care services. For the purposes of this provision, primary care focus means involving specific design elements related to eligible clinicians practicing under one or more of the following Physician Specialty Codes: 01 General Practice; 08 Family Medicine; 11 Internal Medicine; 16 Obstetrics and Gynecology; 37 Pediatric Medicine; 38 Geriatric Medicine; 50 Nurse Practitioner; 89 Clinical Nurse Specialist; and 97 Physician Assistant.

- Empanelment of each patient to a primary clinician.

In addition to these required elements, a Medical Home Model or Medicaid Medical Home Model must have at least four of the following additional elements:

- Planned coordination of chronic and preventive care.
- Patient access and continuity of care.
- Risk-stratified care management.
- Coordination of care across the medical neighborhood.
- Patient and caregiver engagement.
- Shared decision-making.
- Payment arrangements in addition to, or substituting for, FFS payments (for example, shared savings, population-based payments).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

### c. Other Definitions

We believe that the proposed terms and definitions are sufficient to clearly implement the Quality Payment Program. These terms cover all steps of the APM Incentive Payment process, from participation in Advanced APMs to QP determinations and payment of incentives. We are aware that this is a complex program and that we propose to define a significant number of terms. We believe that, in general, it is preferable to use more, distinctive terms than to use fewer broader terms that could overlap and convey different meanings in different contexts. For instance, Partial QP Patient Count Threshold is a highly specific term, but we believe that it is necessary in context because there are differences between QPs and Partial QPs, and there are differences between the payment amount and patient count thresholds used to determine whether an eligible clinician becomes a QP or a Partial QP.

We sought comment on these terms, including our proposed definitions, the relationship between terms, any additional terms that we should formally define to clarify the explanation and implementation of this program, and potential conflicts with other terms used by CMS in similar contexts. We also sought comment on the naming of the terms and whether there are ways to name or describe their relationships to one another that make the definitions more distinct and easier to understand. For instance, we wanted to know if commenters believe there are more intuitive or efficient terms than those proposed that would still adhere to the statutory language and the intended purposes of the terms. In particular, we indicated that we would consider options for a framework of definitions that might more intuitively distinguish between APMs and Other Payer APMs and between APMs and Advanced APMs.

We also sought comment on alternative terms or definitions that could be useful in the calculations described in the proposed regulations in §§414.1430, 414.1435, 414.1440, and 414.1445 of this final rule with comment period and easily understood by stakeholders.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Some commenters expressed concern that non-physician practitioners are not included in the Advanced APM considerations and should be more explicitly represented in APM design. Some commenters requested that the Advanced APM CEHRT criterion should be waived for APMs that include non-physician practitioners because such clinicians were not eligible for incentive payments or subject to reduced Medicare payments related to the meaningful use of CEHRT under the Medicare EHR Incentive Program. Other commenters simply inquired about whether PTs, OTs, and SLPs are eligible to become QPs. One commenter found it confusing to use the term “professional” instead of the term “clinician.”

Response: We appreciate that commenters expressed concern about the inclusion of non-physician practitioners in Advanced APMs. We believe it is important to clarify that physicians are not the only eligible clinicians who can become QPs. The list of eligible clinicians is defined in section 1833(z)(3)(B) of the Act (by cross-reference to the definition of “eligible professional” in section 1848(k)(3)(B)), and includes: physicians, physician assistants, nurse practitioners, clinical nurse specialists, certified registered nurse anesthetists, certified nurse-midwives, clinical social workers, clinical psychologists, registered dietitians or nutrition professionals, physical or occupational therapists, qualified speech-language pathologists, and qualified audiologists; and a group that includes these professionals.

Therefore, any of those eligible clinicians who participate in Advanced APMs can become QPs for a year and receive the associated APM Incentive Payment. Each APM has its own focus, and many offer opportunities for non-physician practitioners to be participants. Although altering the design of existing or future APMs is beyond the scope of this final rule with comment, we welcome ideas on how to further engage underrepresented clinicians as we work hard to develop more APM opportunities. Finally, we do not believe it would be appropriate to waive the Advanced APM CEHRT requirement for APM Entities that may

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

comprise non-physician practitioners. We believe it is also important to note that, as described in full in section II.F.4.b.(1) of this final rule with comment period, the Advanced APM criteria describe requirements that apply within APMs, but not necessarily to all APM Entities or eligible clinicians in the APM. Under the finalized policy in section II.F.4.b.(1), an APM does not necessarily have to specify that all non-physician practitioners use CEHRT in order to be an Advanced APM.

We are finalizing the definition of “eligible clinician” as proposed. Eligible clinician has the meaning of the term “eligible professional” as defined in section 1848(k)(3) of the Act, is identified by a unique NPI and includes any of the following: a physician; a practitioner described in section 1842(b)(18)(C) of the Act; a physical or occupational therapist or a qualified speech-language pathologist.; a qualified audiologist (as defined in section 1861(l)(3)(B) of the Act) or a group that includes these professionals.

We received no comments in response to our other proposed terms and definitions.

We are finalizing all other definitions listed in this section as proposed.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

#### 4. Advanced APMs

This section defines and outlines the proposed criteria for Advanced APMs, APMs through which eligible clinicians would have the opportunity to become QPs as specified in section 1833(z)(3)(C) and (D) of the Act. Other Payer Advanced APMs, types of alternative payment arrangements related to the All-Payer Combination Option, are addressed in section II.F.7. of this final rule with comment period.

An Advanced APM must, by statute, meet certain requirements, and we are finalizing policies for these requirements within this section. First, the broad category of APMs is defined at section 1833(z)(3)(C) of the Act, which states that an APM is any of the following: (i) a model under section 1115A (other than a health care innovation award); (ii) the Shared Savings Program under section 1899; (iii) a demonstration under section 1866C; or (iv) a demonstration required by federal law.

We believed it was necessary to propose additional clarification around the requirements as defined in section 1833(z)(3)(C)(iv) of the Act given the broad scope of programs and demonstrations required by federal legislation that are administered by the Department. We proposed that in order to be an APM as a “demonstration required by Federal law,” the demonstration must meet the following 3 criteria: (1) the demonstration must be compulsory under the statute, not just a provision of statute that gives the agency authority, but one that requires the agency to undertake a demonstration; (2) there must be some “demonstration” thesis that is being evaluated; and (3) the demonstration must require that there are entities participating in the demonstration under an agreement with CMS or under a statute or regulation. We solicited comments on our proposal for these criteria defining a demonstration required under federal law.

We received no comments regarding our proposal that these three criteria must be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

satisfied in order for a demonstration to be considered an APM as a “demonstration required by Federal law.”

We are finalizing our proposal that an APM that is considered a demonstration required by Federal law is one that meets the following 3 criteria: (1) the demonstration must be compulsory under the statute, not just a provision of statute that gives the agency authority, but one that requires the agency to undertake a demonstration; (2) there must be some “demonstration” thesis that is being evaluated; and (3) the demonstration must require that there are entities participating in the demonstration under an agreement with CMS or under a statute or regulation.

Second, to be considered an Advanced APM, an APM must meet all three of the following criteria, as required under section 1833(z)(3)(D) of the Act. The criteria are:

- The APM must require participants to use CEHRT;
- The APM must provide for payment for covered professional services based on quality measures comparable to those in the quality performance category under MIPS;
- The APM must either require that participating APM Entities bear risk for monetary losses of a more than nominal amount under the APM, or be a Medical Home Model expanded under section 1115A(c) of the Act. For a discussion of Medical Home Models under this criterion, see section II.F.4.b.(6) of this final rule with comment period.

In some cases, APMs offer multiple options or tracks with variations in the level of financial risk, or multiple tracks designed for different types of organizations, and we proposed to assess the eligibility of each such track or option within the APM independently. For instance, the Shared Savings Program has three distinct tracks, the Comprehensive ESRD Care Initiative (CEC) consists of a two-sided track for large dialysis organizations and a one-sided track for non-large dialysis organizations with the option for non-large dialysis organizations to elect to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participate in the two-sided risk track beginning in 2017, and the Next Generation ACO Model has two risk arrangement options that feature different levels of financial risk.

Significant distinctions between the design of different tracks or options may mean that some tracks or options within an APM would meet the Advanced APM criteria while other tracks or options would not. For example, APM Entities may have the option to assume two-sided risk (meaning that they bear a portion of the losses when spending exceeds expectations and share in the savings when spending is below expectations) or one-sided risk (meaning that they share in the savings when spending is below expectations, but do not bear a portion of the losses when spending exceeds expectations) under an APM. If the one-sided risk track does not meet the standard for financial risk as discussed in section II.F.4.b.(3) of this final rule with comment period, APM Entities in this track would not be Advanced APM Entities, whereas those in the two-sided risk track could be Advanced APM Entities. In these instances, we would distinguish that the APM is only an Advanced APM for specific options or tracks.

The following is a summary of the comments we received regarding our proposal to make Advanced APM determinations for each individual track or option within in APM when applicable.

Comment: Commenters expressed general agreement that in cases where APMs offer multiple options or tracks, we should evaluate each option or track against the Advanced APM criteria independently.

Response: We thank the commenters for their responses and agree that this proposal is logical.

We are finalizing the proposal to consider different tracks or options within an APM separately for purposes of making Advanced APM determinations. All entities participating in Advanced APMs are Advanced APM Entities, and distinguishing between the model and the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participating entities allows us to directly identify and discuss the requirements unique to each.

This approach to identifying Advanced APMs and Advanced APM Entities is also consistent with our finalized proposals for determining QPs, described in section II.F.5. of this final rule with comment period, at the Advanced APM Entity level.

#### a. Advanced APM Determination

To determine Advanced APMs and to support transparency for the Quality Payment Program, we proposed to establish a process by which we identify and notify the public of the APMs (including specific APM tracks or options) that would be considered Advanced APMs for a QP Performance Period. We indicated that we would post an initial notification to our website prior to the beginning of the first QP Performance Period and update the information on a rolling basis as explained below. We believed that making this information available in a timely and accessible format is important for stakeholders to understand how we apply the Advanced APM criteria to existing APMs and to be informed as early as possible about whether an APM they are considering joining is an Advanced APM.

We proposed two phases of Advanced APM determinations and notice. First, we proposed to release an initial set of Advanced APM determinations no later than January 1, 2017, for APMs that will be operating during the first QP Performance Period. Second, for new APMs announced after January 1, 2017, we would include its Advanced APM determination in conjunction with the first public notice of the APM, such as the Request for Applications (RFA) or final rule. In preliminary discussions of potential APMs, such as proposed rules, we will provide a non-binding determination based on the proposed APM design. We proposed that determinations of Advanced APMs would be posted on our website and updated on an ad hoc basis to the extent feasible, but no less frequently than annually, as new APMs become available and others end or change. Both the initial and ad hoc notifications would contain descriptions of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

whether each track or option within an APM would have in different Advanced APM statuses.

We believe that this proposal incorporates both the interest in immediate dissemination of Advanced APM determinations for the existing APM portfolio following finalization of this rule and the structure for making the Advanced APM status a regular part of the development and release of new APMs in the future.

We solicited comment on the proposals for both the initial and ad hoc notices of Advanced APM determinations. In particular, we solicited comments on optimal times, locations, formats, and other methods of notice of Advanced APM determinations to promote clarity and consistency as to which APMs are considered Advanced APMs for a particular QP Performance Period.

The following is a summary of the comments we received regarding our proposed process to make and notify the public of Advanced APM determinations.

Comment: Some commenters requested that we develop a transparent public process for determining which APMs are Advanced APMs. For example, some commenters stated there should be a public comment process before each APM is determined to be an Advanced APM. Other commenters stated that the public should have public input into how we determine which APMs are Advanced APMs. Other commenters simply stated that they want timely information necessary to be able to make educated decisions about the APM participation.

Response: We agree with the commenters that transparency is important to the future development and determination of Advanced APMs. This rulemaking process is part of that public input process and gives stakeholders and the public an opportunity to provide input into the criteria and process by which we make and announce Advanced APM determinations, as well as develop new APMs. Our proposal described how we would make Advanced APM determinations publicly available as new models are announced. We also publish Requests for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Information (RFIs) and proposed rules for purposes of developing certain APMs, which are further opportunities for public input as we make Advanced APM determinations. In addition, the PTAC, as described in section II.F.10. of this final rule with comment period, represents a significant new pathway for the public to offer new ideas for implementation as APMs.

However, we do not find it practical or meaningful to hold a public comment process regarding each Advanced APM determination. These determinations will be factual applications of the Advanced APM criteria, as prescribed by statute and established in this final rule, to the design of a particular APM. The opportunities for meaningful input are in the development of the criteria and the APMs, but not in the administrative task of determining whether the APM meets the Advanced APM criteria. Soliciting input on Advanced APM determinations for individual models could also significantly delay when stakeholders would know whether an APM is an Advanced APM.

Comment: Several commenters urged us to make the first round of official Advanced APM determinations either in this final rule or as soon as possible after this final rule is published with subsequent updates in a timely manner that allows for APM participation decisions based on those determinations. The commenters expressed that knowing the Advanced APM status of an APM is very important to decisions regarding participation. Some commenters expressed frustration that for 2017 they had to make APM participation decisions prior to the publication of this final rule with comment period. Commenters also stated that the expiration of the APM Incentive Payment after 6 years puts additional pressure on clinicians to join Advanced APMs as soon as possible, and expressed a wish for a greater number of immediate opportunities to participate in Advanced APM.

Response: We appreciate the comments and support for our proposed policy regarding the timeliness of Advanced APM determinations, and we agree that it is essential going forward

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that we provide determinations as soon as practicable in order to support decision making by eligible clinicians and entities. Following publication of this final rule with comment period, we will release the 2017 list of Advanced APMs as soon as possible but no later than January 1, 2017. Then, we will update this list with each material APM amendment or new APM release.

We understand the difficulties of a notice and comment rulemaking process when eligible clinicians and entities are trying to make business decisions that can be impacted by policy decisions in a final rule. The proposed rule offered our early thoughts as to which APMs might be considered Advanced APMs in 2017. We encourage stakeholders keep in mind that the designs of APMs themselves offer substantial rewards, and we believe that those design elements should be the primary considerations for eligible clinicians and entities in deciding whether or not to participate in a given APM. Also, in sections II.F.1. and II.F.10. of this final rule with comment period we discuss how we plan to increase the number of Advanced APM opportunities each year.

Some concerns expressed by commenters about Advanced APM determinations are closely linked with our policies on the QP Performance Period and the MIPS performance period, and the interaction between these policies. We encourage commenters to see the discussion of the QP Performance Period in section II.F.5.a. of this final rule with comment period, which describes the operational relationships that address the need to make QP determinations in time for their exclusion from MIPS.

Comment: Some commenters suggested that we collaboratively develop and vet the format and style of Advanced APM notifications with stakeholders to make them as helpful as possible to potential participants.

Response: Although the development of education and outreach materials regarding the Quality Payment Program is a subregulatory activity, we agree with commenters and plan to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

actively engage relevant stakeholders in the development of our messages and materials.

Materials related to particular APMs are outside the scope of this final rule with comment period.

We are finalizing the process for determining Advanced APMs and notifying the public of those determinations as proposed. We will release an initial set of Advanced APM determinations as soon as possible but no later than January 1, 2017. For new APMs that are announced after the release of our initial set of Advanced APM determinations, we will include Advanced APM determinations in conjunction with the first public notice of the APM, such as the Request for Applications (RFA) or final rule. Likewise, if we make changes to an APM that change the determination of whether the APM is an Advanced APM, we will include public notice with the announcement. All determinations of Advanced APMs will be posted on our website and updated on an ad hoc basis, but no less frequently than annually, as new APMs become available and others end or change. Both the initial and ad hoc determinations will include descriptions of whether each track or option within an APM is or is not an Advanced APM.

In section II.F.7. of this final rule with comment period, we finalize how we would identify Other Payer Advanced APMs. The Other Payer Advanced APM identification process goes into effect starting in the third QP Performance Period (applicable for payment year 2021) and aligns with the availability of the All-Payer Combination Option for QP determinations.

#### b. Advanced APM Criteria

Under the statute, for an APM to be an Advanced APM it must meet the criteria set forth in sections 1833(z)(3)(C) and (D) of the Act and discussed below. An Advanced APM must be an APM that:

- Requires its participants to use certified EHR technology (CEHRT), as described in section II.F.4.b.(1) of this final rule with comment period;

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Provides for payment for covered professional services based on quality measures comparable to measures under the quality performance category under MIPS, as described in section II.F.4.b.(2) of this final rule with comment period; and

- Either (a) requires its participating Advanced APM Entities to bear financial risk for monetary losses that are in excess of a nominal amount, as described in section II.F.4.b.(3) of this final rule with comment period, or (b) is a Medical Home Model expanded under section 1115A(c) of the Act, as described in section II.F.4.b.(4) of this final rule with comment period.

These requirements as set forth in the statute and as proposed must be met through the design of the APM. Whether an APM is an Advanced APM depends solely upon how the APM is designed, rather than on assessments of participant performance within the APM. Some stakeholders have suggested that actual performance (for example, on CQMs or on whether the Advanced APM Entity generates savings) be considered in the determination of QPs. However, the incentives for Advanced APM participation, as specified under section 1833(z) of the Act, do not provide for consideration of actual performance in making such determinations. Performance assessments are already part of APMs, and we believe it is important and consistent with the statutory framework to continue to foster flexibility in structuring the specific rewards and consequences of performance within each APM.

For example, an APM that ties payments to performance on quality measures comparable to those under MIPS may be an Advanced APM regardless of an Advanced APM Entity's actual performance on those quality measures. If an Advanced APM Entity fails to meet quality performance standards under the Advanced APM, it would face consequences within the Advanced APM, such as financial penalties, loss of access to data or certain waivers, or termination of its participation agreement. The termination scenario would have the downstream effect of terminating Advanced APM Entity status and the eligible clinicians' potential eligibility

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for the APM Incentive Payment because the entity would no longer be participating in the Advanced APM. As another example, an Advanced APM Entity that bears more than nominal financial risk for monetary losses in accordance with the standards set forth in section II.F.4.b.(3) of this final rule with comment period would be an Advanced APM Entity regardless of whether it actually earns savings or generates losses under the Advanced APM. This would work similarly for an Other Payer Advanced APM.

We do not intend to add additional performance assessments on top of existing Advanced APM standards. As stated in the discussion of policy principles at the beginning of section II.F.1. of this final rule with comment period, the proposed QP determination process assesses the relative degree of participation of the Advanced APM Entity and eligible clinician in Advanced APMs, not their performance as assessed under the APM. The Quality Payment Program would not alter how each particular APM measures and rewards success within its design. Rather, the APM incentive track of the Quality Payment Program rewards a substantial degree of participation in Advanced APMs.

The following is a summary of the comments we received generally regarding our Advanced APM criteria proposals.

Comment: Many commenters stated their belief that the Advanced APM criteria are generally too complex and restrictive and that they should be simpler and more flexible in order to: (1) reflect the current level of clinician readiness for quality measurement, EHR use, and risk arrangements; (2) allow more APMs to meet the criteria; and (3) encourage broad participation in APMs. Some commenters believe that the most popular APMs should be Advanced APMs, and that if APMs are not Advanced APMs, clinicians will be deterred from participation in a way that could reverse recent progress towards greater APM participation. Some commenters stated that all Innovation Center models should be considered Advanced APMs, regardless of whether

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

or not they meet the criteria. Other commenters suggested that we reward clinicians for demonstrating movement toward APMs or Advanced APMs or that we consider APMs that move toward meeting the Advanced APM criteria in the future to be deemed Advanced APMs in the interim. One commenter recommended that there should be two paths: one that most clinicians should strive for, and a more difficult path restricted to 20 percent of all clinicians. One commenter recommended that CMS allow small practices that report quality via a QCDR to be considered as participants in the Advanced APMs.

Response: We understand that commenters consider the Advanced APM criteria too complex or too demanding. We agree with commenters that, all else equal, less complex criteria are preferable, regardless of the underlying difficulty for APMs to meet the criteria. Accordingly, in finalizing this rule, we have made several policy changes in order to simplify the Advanced APM criteria—for the CEHRT criterion by not changing over time the percentage of use an APM must require; and for the financial risk criterion by eliminating the marginal risk components of the nominal amount standard.

Regarding the stringency of the criteria, we agree with some of the concerns raised by commenters. In particular, we agree in that the magnitude of the proposed requirements for the financial risk criterion was too high, and we are modifying our final policies accordingly. On the other hand, it has never been our expectation that all or most clinicians will participate in Advanced APMs immediately, nor do we believe that was the statutory intent. As such, we do not believe the fact that not all APMs qualify as Advanced APMs in itself implies that the criteria are overly stringent. We worked within the statutory structure to define the Advanced APM criteria, which inherently are meant to distinguish between APMs with more and less challenging terms. That said, we believe that all APMs offer meaningful opportunities and benefits to clinicians, particularly as on-ramps to eventual participation in Advanced APMs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Finally, it is important for commenters and stakeholders to keep in mind that no eligible clinicians or APM Entities are directly subject to these Advanced APM criteria. These are standards used to determine which APMs are Advanced APMs. The APM designs contain the terms under which APM Entities participate, and many Advanced APMs will have requirements that far exceed the Advanced APM criteria set in this final rule. Changing the Advanced APM criteria will not affect the requirements for participants in any particular Advanced APM.

Comment: Some commenters stated that the Advanced APM criteria should be wholly different from those proposed. For instance, some commenters expressed that we should synchronize the criteria with the APM Framework developed by the Health Care Payment Learning and Action Network (LAN) APM Framework and Progress Tracking Work Group, which classified four categories of APMs.

Some commenters were supportive of the Advanced APM framework but expressed support for additional criteria for determining Advanced APMs, such as demonstrating that the payment approach will reinforce the delivery of coordinated patient- and family-centered care; requiring a clinical care model that reinforces a strong primary care foundation; a focus on care coordination; shared care planning; health IT infrastructure development; population health management; risk management; emphasis on consumer experience; and several more. One commenter suggested that we remove the Advanced APM designation from Advanced APMs that fail to demonstrate successful outcomes.

Response: We appreciate the input on how Advanced APMs should be determined and designed, and we agree that these concepts are important in the design of particular APMs. However, the statute specifies the criteria we must use to determine Advanced APMs, and we are implementing the statutory criteria in this rulemaking process. Although the comments on additional specifications for Advanced APMs are beyond the scope of this final rule with

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

comment period, we remind the commenters of the PTAC, as described in section II.F.10. of this final rule with comment period, and note that commenters can submit ideas for APM designs directly to the Innovation Center.

#### (1) Use of Certified EHR Technology

The first criterion an APM must meet to be considered an Advanced APM is that it requires participants in the APM to use certified EHR technology (as defined in section 1848(o)(4) of the Act), as specified in section 1833(z)(3)(D)(i)(I) of the Act.

##### (a) Definition of Certified EHR Technology

For this Advanced APM criterion, we proposed to adopt the definition of CEHRT proposed for MIPS under §414.1305. In the 2015 EHR Incentive Programs final rule (80 FR 62872 through 62873), we established the definition of CEHRT that must be used by EPs to meet the Meaningful Use objectives and measures in specific years. This definition is similar to the definition that applies to eligible hospitals, CAHs, and EPs in the Medicare EHR Incentive Programs. The definition includes the certification criteria for a wide range of standards for use in capturing patient health information like vital signs, medications and medication allergies, problem list, and lab results among other data elements included in the common clinical data set (CCDS). It also includes the certification criteria and standards for functions related to information exchange, patient engagement, quality reporting, and protecting the privacy of electronic protected health information. For further information on the certification criteria, see the 2015 Edition Certification Criteria final rule (80 FR 62602 through 62759) and for example Table 8: “Common Clinical Data Set” (80 FR 62696).

This approach aligns the APM health IT certification requirements for Advanced APMs with those used by MIPS eligible clinicians. We understand this proposed CEHRT definition may include some EHR functionality used by MIPS eligible clinicians which may be less

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

relevant for an APM participant, and likewise APM participants may use additional functions that are not required for MIPS participation. However, we observe that APM participants often work in the same office space, group, entity, or organization with eligible clinicians that are not APM participants. At times they might share common resources, such as the same EHR system. Using the same CEHRT definition for both MIPS and Advanced APMs would allow eligible clinicians to continue to use shared EHR systems and give eligible clinicians flexibility of participation as a MIPS eligible clinician or an eligible clinician in an Advanced APM without needing to change or upgrade EHR systems. Although updates to the certified health IT for APM participants, MIPS participants, or both may be necessary in future years, we believe that aligning the APM and MIPS definition for CEHRT is appropriate at this time.

We solicited comment on the proposed definition of CEHRT for Advanced APMs.

The following is a summary of the comments we received regarding our proposal to adopt the same definition of CEHRT for Advanced APMs as proposed for MIPS.

Comment: Many commenters expressed strong support for aligning the definition of CEHRT for Advanced APMs with the definition of CEHRT used in MIPS. Several commenters suggested this alignment would reduce administrative costs and reduce confusion among clinicians. One commenter suggested the CEHRT definition be more specific and rigorous. Some commenters suggested specific features and functionality (for example, empanelment of patients, stratification of the patient population, display of eCQM results by clinician and practice site) should be included as required components of the CEHRT definition. One commenter indicated that all Advanced APMs will have different HIT needs; therefore, specific HIT features should not be required for all Advanced APMs.

Response: We appreciate the commenters' suggestions and support for the proposed definition of CEHRT for Advanced APMs. Although a few commenters suggested the CEHRT

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

definition include additional health IT capabilities not included in the CEHRT definition, we believe it is more important to maintain consistency across programs at this time. We also note that, although Advanced APMs must require eligible clinicians in Advanced APM Entities to use systems that at least meet the CEHRT definition, APMs have the flexibility to set additional health IT requirements as necessary to support specific criteria or goals under the APM.

Comment: A commenter suggested that the care plan criterion finalized in the 2015 Edition Certification Criteria should also be included in the CEHRT definition.

Response: The ONC health IT certification program defines the testing and certification criteria for a wide range of potential standards and functions for certified health IT beyond those used for the meaningful use objectives and measures. In some cases, these criteria support other specific CMS program needs; in other cases, they may relate to public quality improvement initiatives in the health care industry. For example, the filtering criteria for eCQMs may support advanced electronic clinical quality measurement by APMs, and the care plan certification criterion may support care coordination especially in chronic disease management. Both of these new functions are available for clinicians within the 2015 Edition, and clinicians may use health IT modules certified to these criteria to support quality measurement, clinical practice improvement activities and participation in an APM or other payer arrangement.

The CEHRT definition merely sets the baseline requirements that eligible clinicians must have to meet the meaningful use objectives and measures, which are designed to be applicable for a wide range of clinician types in a diverse range of settings. These requirements are not intended to limit clinicians electing to use more advanced functions or to use health IT in other ways. Rather, the CEHRT definition is intended to ensure that a user has the tools needed to succeed in meeting the objectives and measures, without creating additional burden to obtain health IT unrelated to their practice. As stated in the proposed rule at 81 FR 28299, we intend to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

maintain continuity for APM participants with the definition recently finalized for the eligible clinicians participating in the MIPS advancing care information performance category, described at §414.1305. This is also consistent with the EHR Incentive Program's CEHRT definition at 42 FR 495.4. Therefore, we are finalizing the same definition of CEHRT under the Advanced APM CEHRT use criterion as we have finalized for MIPS at §414.1305. We will consider whether to include the care plan and other potentially new or advanced certified health IT modules in future rulemaking.

Comment: One commenter believes that a strong, broad Health IT infrastructure should be a key element used to identify Advanced APMs rather than the narrow proposed CEHRT criteria. This commenter defined this as the adoption of EHRs, patient registries, or an alternative IT architecture that allows for timely exchange of health data with other clinicians involved in a patient's care and generation of meaningful data analytics. One commenter recommended that CMS engage the health IT community before introducing additional APMs that rely heavily upon IT products and services, especially if those models have unique or specialized technology requirements.

Response: We agree that Advanced APMs need a strong health IT infrastructure as a foundation for communicating and delivering comprehensive and coordinated care to their patients. However, we also believe that it is important to leave flexibility for individual models to tailor their health IT requirements to the needs of their particular population and goals. Section 1833(z)(3)(D)(i)(I) of the Act requires that Advanced APMs require their APM participants to use CEHRT (as defined in section 1848(o)(4) of the Act), and we continue to believe the definition we proposed meets this criterion while maintaining flexibility for individual APMs to set broader health IT requirements.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are finalizing the definition of CEHRT for Advanced APMs as proposed. We believe the CEHRT definition for Advanced APMs aligns the APM health IT certification requirements for Advanced APMs with those used by MIPS eligible clinicians and will permit eligible clinicians using shared systems to participate in both programs without requiring changes to their health IT systems.

#### (b) Requiring the Use of CEHRT

The statute does not specify the number of eligible clinicians who must use CEHRT or how CEHRT must be used in an Advanced APM. We believe we have discretion to define the ways in which an Advanced APM requires the use of CEHRT. In accordance with section 1833(z)(3)(D)(i)(I) of the Act, we proposed that an Advanced APM must require at least 50 percent of eligible clinicians (or each hospital if hospitals are the APM participants) to use the certified health IT functions outlined in the proposed definition of CEHRT to document and communicate clinical care with patients and other health care professionals. Communicating clinical care means that other eligible clinicians and/or the patient can view the clinical care information. We also proposed an alternative set of criteria that would be applicable to the Shared Savings Program to demonstrate the use of CEHRT by eligible clinicians participating in ACOs to allow the Shared Savings Program to be an Advanced APM, as discussed further below. We proposed the 50 percent CEHRT use threshold would be confined to the first QP Performance Period (proposed to be 2017, as discussed later in this final rule with comment period). That is, only in 2017 could APMs use the 50 percent threshold for eligible clinicians in each participating entity to meet the use of CEHRT requirement. We proposed that the threshold requirement for use of CEHRT would increase to 75 percent beginning for the second QP Performance Period (proposed to be 2018). The CEHRT requirement for Advanced APMs in which hospitals are the participants would remain the same over time because it is an all-or-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

nothing requirement of the hospital as a single entity.

We believe there are a few reasons why having a lower threshold requirement for the use of CEHRT by the eligible clinicians participating in an APM Entity in the first year is appropriate. First, we wanted to ensure that APMs have sufficient time to alter their terms and conditions to meet this standard. We also acknowledge that eligible clinicians would be expected to upgrade from technology certified to the 2014 Edition to technology certified to the 2015 Edition for use in 2018, and some eligible clinicians who have not yet adopted CEHRT may wish to delay acquiring CEHRT products until a 2015 Edition certified product is available.

This CEHRT requirement would be based on the requirements that an APM places on its participating APM Entities. In determining whether an APM meets this criterion, we did not propose to assess the level of use of each APM Entity or individual eligible clinician participating in the APM but rather whether the APM requirements meet the standard set forth in the proposed rule.

We invited comment on whether the proposed thresholds for use of CEHRT for APM Entities that are not hospitals (50 percent for the first QP Performance Period (proposed 2017) and 75 percent for the second QP Performance Period (proposed 2018) and later are appropriate, or if we should consider additional options such as a higher or lower percentage in 2018, or an additional incremental increase for 2019. We also invited comment on whether we should consider higher thresholds for APMs that target eligible clinician populations with higher-than-average adoption of certified health IT, such as eligible clinicians in patient-centered medical homes. Finally, we invited comment on whether we should explore ways to set lower thresholds for those APMs targeting eligible clinician populations that may have lower average adoption of certified health IT, such as specialty-focused APMs.

The following is a summary of the comments we received regarding the proposed

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

thresholds for use of CEHRT for APM Entities that are not hospitals.

Comment: Numerous commenters supported the proposed criterion for the 2017 QP Performance Period. However, the majority of those commenters stated that CMS should not raise the CEHRT use requirement to 75 percent in 2018 and later. A few commenters requested that CMS provide more time to meet the 50 percent requirement, that CMS should have lower thresholds for certain specialties, or that any increase be gradual. Many commenters indicated that raising the threshold in 2018 to 75 percent would be unattainable for some APM Entities. Some commenters also suggested that this criterion not apply if their MIPS advancing care information performance category weight is reduced to zero (for example, because they are hospital-based, have insufficient internet coverage, are non-patient facing, or were not previously included as an Eligible Professional in the Meaningful Use program). Another commenter supported the threshold but indicated some specialties should be excluded.

Response: We appreciate the support for the proposed CEHRT use threshold of 50 percent for Advanced APMs for the 2017 performance period. We believe that setting the threshold at 50 percent of eligible clinicians allows APMs sufficient room to meet this requirement even if the APM includes some participants who do not have internet access, lack face-to-face interactions, or are hospital-based. We understand the commenters' concerns that raising the threshold to 75 percent in 2018 may create an overly rigorous standard for Advanced APMs and agree that it would be prudent to wait until we have more information on how the threshold would impact specific APMs, such as specialty APMs, before increasing the threshold, if at all. As a result, we are not finalizing our proposal to increase the requirement of APMs to require 75 percent CEHRT use after the first QP Performance Period.

Comment: Alternatively, a few commenters supported raising the threshold for CEHRT, especially for APMs with above average health IT adoption among participants, and another

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

commenter supported increasing the threshold for CEHRT use in Advanced APMs over time.

Some commenters indicated that the requirement to use CEHRT should not be based on any threshold but instead be based only on an attestation of CEHRT adoption by the Advanced APM eligible clinicians. One commenter requested CEHRT use be limited to a 90-day period in 2017.

Response: We agree with the commenter that certain APMs have APM Entities that may be able to meet a higher CEHRT use threshold. We note that some current APMs include CEHRT use requirements that exceed a 50 percent threshold. Since we expect many, widely varied APMs to be developed and implemented over the next few years, we believe we should use this time to gather more information on which APMs would be able to meet a higher Advanced APM CEHRT use requirement. We do not believe a 90-day period of use is a meaningful standard because the CEHRT is used by eligible clinicians principally as a medical record to document and communicate the clinical care they provide to their patients. Medical record documentation of clinical care is an ongoing activity and therefore we see no reason to limit the criterion of this activity to a 90 day period. We want to clarify for commenters that the requirement for CEHRT use in order for an APM to be an Advanced APM is applicable to the APM, not necessarily to all of the APM participants. The Advanced APM itself could have more stringent requirements and require the use of CEHRT in a variety of ways so long as it requires at least 50 percent of the eligible clinicians in each APM Entity use CEHRT. We do not discount the value of the commenters' suggestions but rather believe that they could or should be incorporated into APM design rather than adopted as the minimum requirement for an APM to be considered an Advanced APM. We appreciate the commenter's suggestion for a process to ascertain whether the CEHRT criterion is met by having the eligible clinicians who are participating in Advanced APMs attest that they have adopted CEHRT rather than including the use of the 50 percent threshold, but we believe the use of a threshold best defines how an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Advanced APM must require its participants to use CEHRT in accordance with the statutory CEHRT use criterion.

Comment: One commenter recommended that a different threshold regarding the adoption of certified HIT should apply to any potential pathology-focused APM because laboratory information systems are not considered certified HIT or EHR technology.

Response: Presently, CMS does not have an Advanced APM that includes individual pathologists as participants of the APM. We will monitor this issue for new APMs and consider the applicability of the CEHRT requirement for APMs in which the majority of the eligible clinicians do not use CEHRT due to lack of certified systems for a particular specialty.

Comment: A few commenters stated agreement with a uniform CEHRT use threshold for all Advanced APMs other than the Shared Savings Program.

Response: We thank commenters for their support, and agree that the same thresholds should be consistent across APMs other than the Shared Savings Program for which we are finalizing a different use of CEHRT requirement.

Comment: A few commenters urged CMS to provide flexibility so that an APM would meet the EHR criterion to be an Advanced APM if it allowed eligible clinicians working in a facility such as a hospital that has CEHRT to be deemed to be using CEHRT. A commenter requested that CMS consider models such as BPCI and CJR as meeting this criterion if participating hospitals are using CEHRT. A commenter also indicated that as a medical group participating in BPCI Model 2, it uses CEHRT and thus should meet this criterion. Another commenter stated that use of any technology within an APM should not imply ownership, control, or the ability of any single user to meet overarching, explicit criteria. The commenter stated that over 90 percent of the nation's hospitals have achieved Meaningful Use, but hospitalists are unlikely to be counted in the 50 percent threshold of "use" as currently proposed

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

by CMS.

Response: We reiterate that the use of CEHRT criterion applies to APMs and the requirements they impose on participating APM Entities, not to the individual APM Entities participating in APMs. For instance, the use of CEHRT criterion would be applied to the design of an APM to assess whether it has a requirement that its participants use CEHRT in a prescribed manner that meets this Advanced APM criterion. We assess the APM's requirements to determine whether an APM meets the Advanced APM CEHRT criterion. A participant cannot meet this criterion simply by using CEHRT; the APM must require the use of CEHRT in its terms and conditions, or a regulation or other legal vehicle through which APM Entities are held accountable. Conversely, an Advanced APM Entity that fails to meet the requirement to use CEHRT under the Advanced APM would have consequences under the terms of the Advanced APM, but such failure to meet the requirement has no bearing on whether or not the APM itself is an Advanced APM. Therefore, it would not be appropriate or practical to build in specific policies around attestation of CEHRT use by eligible clinicians or APM Entities, or to carve out policies for specific clinician types or settings. We further note that, as proposed, the 50 percent CEHRT use threshold pertains only to the requirements that the APM imposes on eligible clinicians within its participating APM Entities. However, if the APM is one in which hospitals are the main participants, then we proposed that the APM must require hospitals to maintain CEHRT in order for the APM to be an Advanced APM. We do not believe that the use of CEHRT requirement implies that the physicians or other participants must invest in duplicative technology to participate in the APM, but rather that the APM must require a certain threshold level of CEHRT use to document and communicate clinical care for their patient population. As is noted above, the use of CEHRT criterion for an Advanced APM is based on the requirements that an APM places on its participating APM Entities. Therefore, in APMs

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

where an APM Entity may use CEHRT in its operations and participation in the APM, but the APM does not explicitly require the use of CEHRT by the APM Entity, the APM would not meet the use of CEHRT criterion for an Advanced APM.

Comment: One commenter recommended that CMS require clinicians participating in the CJR and Bundled Payment for Care Improvement (BPCI) models report data for the advancing care information MIPS performance category and allow that reporting to meet the CEHRT requirement.

Response: We appreciate the suggestion. We believe the proposals for CEHRT use can be applied to these APMs as proposed and therefore there is no need to establish additional detail for the mechanism of requiring CEHRT. As previously stated above it is the APM that must require the use of CEHRT in order to meet this Advanced APM requirement, and not individual entities or clinicians. Consequently, reporting advancing care information to MIPS is not a substitute for the APM to meet this Advanced APM requirement. We also considered these comments in developing proposed amendments to CJR (see 81 FR 50793).

Comment: One commenter recommended that the Advanced APM use of CEHRT criterion be aligned with advancing care information in MIPS.

Response: The definition of CEHRT for MIPS and Advanced APMs will be the same. However, to require that CEHRT use requirements in Advanced APMs be aligned with the MIPS advancing care information performance category would go beyond what the statute requires, and as we have stated, we generally want APMs to retain the flexibility to require activities performed using CEHRT that may vary from those prescribed under the advancing care information performance category in MIPS.

Comment: Some commenters sought additional clarity in how APMs would identify their respective denominator of eligible clinicians. Commenters suggested that CMS represent the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

method for calculating the denominator of eligible clinicians using a mathematical expression, as well as how the level of proof required would translate to an entity-level percentage-based measurement.

Response: We will assess for each APM whether the requirements for CEHRT use meet the threshold for an Advanced APM. We will require that each APM have procedures in place to ensure that its requirements for the use of CEHRT are met. Additionally, the methods used to ascertain whether the 50 percent CEHRT use threshold is met may be unique to each APM. We do not intend to prescribe for APMs the mechanism for enforcement of their CEHRT use requirement.

We are finalizing our proposal that an Advanced APM must require at least 50 percent of eligible clinicians in each APM Entity to use the certified health IT functions outlined in the proposed definition of CEHRT to document and communicate clinical care with patients and other health care professionals. However, we are not finalizing our proposal to increase the requirement of Advanced APMs to require 75 percent CEHRT use in the subsequent year. We will maintain the 50 percent CEHRT use requirement for the second performance year and beyond and consider making any potential changes through future rulemaking. If the APM has hospitals as its APM Entities, the APM would need to require the hospitals to use CEHRT in order to be an Advanced APM, and the 50 percent threshold does not apply. We will monitor the level of CEHRT use that is required in current APMs and assess the applicability of this criterion to new APMs. We will continue to consider additional changes to the CEHRT use criterion for Advanced APMs in future rulemaking, particularly considering Other Payer Advanced APMs.

(c) Requiring Use of CEHRT in the Shared Savings Program

We also proposed an alternative criterion for determining whether an APM meets the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

CEHRT use requirement, exclusively for the Shared Savings Program. We believe this method is appropriate for the Shared Savings Program because although the Shared Savings Program requires ACOs to encourage and promote the use of enabling technologies (such as EHRs) to coordinate care for assigned beneficiaries, a specific level of CEHRT use is not required for participation in the program. Instead, the Shared Savings Program includes an assessment of EHR use as part of the quality performance standard which directly impacts the amount of shared savings/losses generated by the Shared Savings Program ACO. In contrast to APMs authorized by section 1115A of the Act, we would have to undertake significant rulemaking to adopt an eligibility standard for the Shared Savings Program that is consistent with the criterion for other APMs. Following such rulemaking, we would have to collect additional information from each existing and applying ACO outside the routine application process in the weeks prior to the start of the 2017 performance year. We believed this process could introduce uncertainty and burden for CMS, ACOs, and participating eligible clinicians. Moreover, we stated that we believed that the proposed alternative criterion would build on established Shared Savings Program rules and incentives that directly tie the level of CEHRT use to the ACO's financial reward which in turn has the effect of directly incentivizing ever-increasing levels of CEHRT use among eligible clinicians. We believe that the proposed alternative criterion for the Shared Savings Program is consistent with the goals of the APM incentive and reduces burden and uncertainty for the Shared Savings Program participants. Therefore, because most other APMs can accommodate a new CEHRT use requirement for eligible clinicians without modification to our regulations, we proposed to restrict this method to the Shared Savings Program. We proposed that this alternative would allow the Shared Savings Program to meet the criterion if it holds APM Entities accountable for their eligible clinicians' use of CEHRT by applying a financial penalty or reward based on the degree of CEHRT use (such as the percentage of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

eligible clinicians that use CEHRT or the engagement in care coordination or other activities using CEHRT). One of the quality measures used in the Shared Savings Program's quality performance standard assesses the degree to which certain eligible clinicians in the ACO successfully meet the requirements of the EHR Incentive program, which requires the use of CEHRT. Successful reporting of the measure for a performance year gives the ACO points toward its overall quality score, which in turn affects the amount of shared savings or shared losses an ACO could earn or be liable for, respectively. Because of this, ACOs in the Shared Savings Program actively promote and seek to improve upon the EHR measure annually, leading to greater use of CEHRT among eligible clinicians participating in Shared Savings Program ACOs. We explained that we believe our proposed criteria for APMs, generally, and our alternative for the Shared Savings Program, would satisfy requirements under the statute, as both hinge upon the Advanced APM requiring that its participants use CEHRT with consequences for failure to meet the APM's standards. We solicited comment on our proposed methods for the Shared Savings Program to meet the Advanced APM CEHRT use criterion.

Comment: Commenters supported using the proposed alternative criterion to determine whether the Shared Savings Program meets the CEHRT use requirement.

Response: We thank the commenters for their support.

We are finalizing this alternative criterion exclusively for the Shared Savings Program as proposed. This alternative criterion would allow the Shared Savings Program to meet the criterion if it holds APM Entities accountable for their eligible clinicians' use of CEHRT by applying a financial penalty or reward based on the degree of CEHRT use.

The Shared Savings Program meets this criterion by tying performance on ACO-11, a quality measure that assesses the meaningful use of EHR technology by certain eligible clinicians in the ACO, to the amount of shared savings earned or shared losses incurred by an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

ACO. We will use data submitted to us through the MIPS advancing care information performance category for purposes of assessing performance on ACO-11 under all tracks of the Shared Savings Program.

Eligible clinicians who become QPs by participating in an Advanced APM will be exempt from reporting in the advancing care information performance category for purposes of MIPS. However, under §425.500(c) of our regulations, Shared Savings Program ACOs must submit data on ACO quality performance measures according to the method of submission established by CMS. Thus, certain eligible clinicians, as designated in the specifications of ACO-11, participating in ACOs under all tracks of the Shared Savings Program must report for purposes of the advancing care information performance category according to MIPS specifications, regardless of whether they are excluded from MIPS for the year, in order for the Shared Savings Program to assess the ACO's performance on ACO-11, as required by the Advanced APM CEHRT use criterion. As discussed above, we will establish our final policies with respect to the specifications of ACO-11 in the forthcoming CY 2017 PFS final rule with comment period.

We also note that in the CY 2017 PFS Proposed Rule, we propose certain modifications to the EHR measure under the Shared Savings Program (81 FR 46429 through 46430). We will establish our final policies for the specifications of ACO-11 that will be used to assess ACO performance on this measure in 2017 and subsequent years as finalized in the forthcoming CY 2017 PFS final rule.

In addition to the previous proposals, we were interested in what other health IT functionalities APM participants might need to effectively provide care to their patients and how the use of interoperable health IT can strengthen and encourage higher quality patient care and more effective care coordination across all APMs. Recent research and input from experts,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

practitioners, and the public have identified priority health IT capabilities that would be important for participants in APMs but are not yet widely available in current health IT systems, such as the ability to manage and track status of referrals and create and maintain electronic shared care plans for team-based care management. More information about this research is available at

[https://www.healthit.gov/facas/sites/faca/files/HITPC\\_AHMWG\\_Meeting\\_Slides\\_Final\\_Version\\_9\\_2015-11-10.pdf](https://www.healthit.gov/facas/sites/faca/files/HITPC_AHMWG_Meeting_Slides_Final_Version_9_2015-11-10.pdf).

We believe that all patients, families, and healthcare professionals should have consistent and timely access to health information in a standardized format that can be securely exchanged between these parties (See HHS August 2013 Statement, “Principles and Strategies for Accelerating Health Information Exchange”). The secure, appropriate exchange of health information can help health care professionals improve quality of care through more robust care coordination, and improve the efficiency of care through access to patient information across settings. Interoperability is a key priority for the healthcare industry. HHS recently received pledges from companies that provide 90 percent of the EHRs used by hospitals nationwide, available at <https://www.healthit.gov/commitment>, as well as the top five largest health care systems in the country, to help consumers easily and securely access their electronic health information; help clinicians share individuals’ health information for care with other clinicians and their patients whenever permitted by law and not block electronic health information; and implement federally recognized, national interoperability standards, policies, guidance, and practices for electronic health information.

A growing number of organizations across the country are now focused on facilitating health information exchanges (HIEs) among healthcare professionals at the national, state, and community levels. There were 267 organizations providing HIE services operating in the U.S. in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

2014, including community-based organizations, statewide efforts, and other healthcare delivery entities supporting exchange, according to <https://ehi-rails->

[app.s3.amazonaws.com/uploads/article/file/476/2014\\_eHI\\_Data\\_Exchange\\_Survey\\_Results\\_We](https://ehi-rails-)

[binar\\_Slides.pdf](#). While representing a wide variety of stakeholders, services and structures,

these organizations play an important role in facilitating care coordination and data sharing for

many health care professionals across the country. We encourage the growth of these services

and encourage health care professionals to explore partnering with organizations offering HIE

services.

We solicited comment on how requirements for the use of CEHRT within APMs could evolve to support expanded participation in organizations supporting HIEs. The following are the comments received in response to our request for comment related to advancing participation in HIE through the use of CEHRT in Advanced APMs.

Comment: Regarding the future incorporation of HIE participation into the health IT requirements for APMs, a commenter supported recognition for this participation, but suggested that CMS also determine whether a clinician has achieved better care coordination. One commenter recommended that participation in HIEs be required as part of CEHRT standards. Several commenters suggested that CMS identify interoperability measures or standards that easily align with the use of health IT and the achievement of interoperability goals, perhaps focused on specialty-specific use cases. Another commenter suggested that interoperability goals could be achieved through focusing on specialty-specific use cases rather than data quantity evaluations, and that these use cases should be developed in consultation with stakeholders. One commenter supported additional emphasis on usability and compatibility of electronic data collected by HIEs, but the commenter was concerned that HIE data are not always readable by EHR systems. The commenter stated that meaningful health information exchange requires

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

sending the information, receiving the information, and being able to use the information for patient care. Another commenter urged CMS to state its goals before asking how the use of interoperable health IT strengthens and encourages higher quality patient care and more effective care coordination across all APMs. One commenter did not believe new health IT standards and certification criteria are needed; rather, the existing standards need to be recognized and adopted in a consistent manner that does not vary by vendor. Implementation guides promulgated by standards organizations may be helpful in this regard. The commenter also urged more research on how EHRs affect workflows, both positively and negatively, particularly as workflows are changing due to reporting requirements.

Response: We thank commenters for supporting the idea of recognizing participation in an organization facilitating HIE as part of future CEHRT requirements for APMs, and agree that care coordination through the secure, electronic exchange of health information is an important capability for providers participating in an Advanced APM. We note that while Advanced APMs are required to base payment on quality measures comparable to those in MIPS, in order to encourage flexibility and innovation for APMs, CMS is not identifying the specific measures which APMs must use. In future rulemaking, we will consider how to incorporate participation in an organization facilitating HIE into the Advanced APM CEHRT requirement.

Comment: Commenters provided a variety of recommendations regarding the health IT capabilities that APM participants will need to effectively provide care to patients. Commenters focused on improved capabilities to manage and incorporate data, including improved capacity to manage and present interoperable health information in usable workflow and more standardization around how data is extracted from different systems. Commenters also suggested further work on health IT capabilities to improve referral processes, such as the ability to look up information about other clinicians, including specialty, commitment to care coordination, patient

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

preference, and alignment with the patient's health plan network; ability to cross-reference the organization's preferred providers and preferred providers identified by the patient or plan; and better integration of preferred provider lists into document templates used in the referral process.

Response: We thank the commenters for their responses and will take these recommendations into consideration in the future as we continue to examine the CEHRT use requirement for Advanced APMs.

## (2) Comparable Quality Measures

The second criterion for an APM to be an Advanced APM is that it provides for payment for covered professional services based on quality measures comparable to measures under the performance category described in section 1848(q)(2)(B)(i) of the Act, which is the MIPS quality performance category. We interpret this criterion to require the APM to incorporate quality measure results as a factor when determining payment to participants under the terms of the APM.

Our proposed policy for this criterion was informed by our proposed policy for the MIPS quality performance category. Quality measures under the MIPS quality performance category are discussed in section II.E.3.b. of this final rule with comment period. In that section, we discuss our proposal for eligible clinicians to select quality measures from the MIPS measures list for the first MIPS performance period. We indicated that we would publish a list of quality measures annually, through notice and comment rulemaking, from which MIPS eligible clinicians may choose measures for assessment under the MIPS quality performance category. The measures included in the annual list of MIPS measures must adhere to specific criteria that include the following: (1) measures must have an evidence-based focus if the measures are not endorsed by a consensus-based entity as described in section 1848(q)(2)(D)(v) of the Act; and (2) new measures and the method for developing and selecting such measures, including clinical

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

and other data supporting such measures, must be submitted to a specialty-appropriate, peer-reviewed journal prior to inclusion of the measure in MIPS as described in section 1848(q)(2)(D)(iv) of the Act.

The statute also established priorities for both the quality domains of measures to be developed and the types of measures to be prioritized in the measure development plan, which are located, respectively, at sections 1848(s)(1)(B) and (D) of the Act. The priority measure types include outcome, patient experience, care coordination, and measures of appropriate use of services such as measures of overuse.

We wanted to ensure that APMs have the latitude to base payment on quality measures that meet the goals of the APM and assess the quality of care provided to the population of patients that the APM participants are serving. It is important to note that many APMs include some common measures that are proposed for inclusion in MIPS. For example, many of the quality measures used in the Shared Savings Program and the Next Generation ACO Model are also proposed for inclusion in MIPS.

However, APMs that focus on patients with specific clinical conditions such as end-stage renal disease (ESRD), or on patients undergoing specific surgical procedures, would have valid reasons for including different quality measures than those that target more general populations. Similarly, some APMs may focus on specialist eligible clinicians for whom there may be only a small number of valid and relevant quality measures. Lastly, we cannot predict the specific care goals and payment designs of future PFPMs and other APMs. Consequently, we did not want to impose measure requirements that would prevent us from including quality measures that may be better suited to the specific aims of new innovative APMs.

We proposed that the quality measures on which the Advanced APM bases payment must include at least one of the following types of measures provided that they have an evidence-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

based focus, and are reliable, and are valid:

- (1) Any of the quality measures included on the proposed annual list of MIPS quality measures;
- (2) Quality measures that are endorsed by a consensus-based entity;
- (3) Quality measures developed under section 1848(s) of the Act;
- (4) Quality measures submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act; or
- (5) Any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid.

We believe that quality measures that are endorsed by the National Quality Forum (NQF) would meet these criteria. Because each APM Entity is different, there needs to be the flexibility to determine which measures are most appropriate for use in their respective APM for the purpose of linking those measures to payment under the APM. Measures that could be used in both MIPS and APMs are beneficial to eligible clinicians who may switch from one program to the other, but we also do not want to restrict APMs from including new innovative measures that may not be included in MIPS initially, or until later years of the program.

We also proposed to establish an Innovation Center quality measure review process for those measures that are not NQF-endorsed or included on the final MIPS measure list to assess whether the quality measures have an evidence-based focus, and are reliable and valid. For example, the Comprehensive ESRD Care Model includes NQF# 0226 Influenza Immunization for the ESRD Population which is not a measure included for reporting in MIPS but meets the proposed criteria for MIPS-comparable quality measures. We stated that we believe, under the proposed categories, MIPS-comparable quality measures could include measures that are fully developed after being tested in an APM and found to be reliable and valid. Similarly, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

indicated that we believe MIPS-comparable quality measures could include QCDR measures provided that the QCDR measures used by the Advanced APM for payment have an evidence-based focus and are reliable and valid.

The statute identifies outcome measures as a priority measure type, and we wanted to encourage the use of outcome measures for quality performance assessment in APMs. Therefore, we proposed that in addition to the general comparable quality measure requirements proposed, an Advanced APM must include at least one outcome measure if an appropriate measure (that is, the measure addresses the specific patient population and is specified for the APM participant setting) is available on the MIPS list of measures for that specific QP Performance Period, determined at the time when the APM is first established. If there is no such measure available on the MIPS list at the time the APM is established, then we would not require an outcome measure be included after APM implementation.

We also noted that under the statute and in this proposal, not all quality measures under which an APM is assessed are required to be “comparable” and not all payments under the APM must be based on comparable measures. However, at least some payments must be tied to measures comparable to MIPS, regardless of whether those comparable measures are the only ones the APM uses. Under this proposal, APMs retain sufficient freedom to innovate in paying for services and measuring quality. For instance, an APM may have incentive payments related to quality, total cost of care, participation in learning activities, and adoption of health IT. The existence of all of the payments associated with non-quality aspects does not preclude the APM from meeting this Advanced APM criterion. In other words, this criterion only sets standards for payments tied to quality measurement, not other methods of payment. Conversely, an APM may, as current models at the CMS Innovation Center currently do, test new quality measures that do not fall into the MIPS-comparable standard. So long as the APM meets the requirements set forth

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

in this criterion, there is no additional prescription for how the APM tests additional measures that may or may not meet the standards under this criterion.

We indicated that we believe this framework would provide the flexibility needed to ensure APM quality performance metrics meet the APM's goals. We invited comments on whether measures to be considered comparable to MIPS should all be reliable and valid and have an evidenced-based focus.

The following is a summary of the comments we received regarding our proposed Advanced APM quality measures criterion.

Comment: The majority of commenters support CMS' proposal. Commenters sought additional insight and specificity on the types of quality measures that would be tied to Advanced APM payments and also suggested CMS seek stakeholder input regarding what measures are included in Advanced APMs. One commenter stated that while they support the proposed requirement that MIPS-comparable measures for the Advanced APM criteria be evidence-based, reliable and valid, they believe a minimum number of 10 measures should be required to be included in the Advanced APM.

Response: Examples of measures that would meet the proposed criterion for MIPS-comparable measures include almost any quality measure that is NQF endorsed, or measures included in the final list of MIPS quality measures, provided that the measure has an evidence-based focus, is reliable, and is valid. The Advanced APM criterion to include measures comparable to MIPS does not require CMS seek stakeholder input on the measure(s) used in Advanced APMs, but we do welcome stakeholder input on our selected measures for inclusion in Advanced APMs through other vehicles, for example, RFIs or subsequent proposed rules. With respect to the number of measures for performance assessment included in Advanced APMs, there is no statutory requirement that a specific number of measures need to be included in order

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for the APM to provide for payment for covered professional services based on MIPS-comparable quality measures, and we believe Advanced APMs generally should retain flexibility to require the appropriate number of measures for its goals.

Comment: One commenter supported principles that left selection of quality measures to the Advanced APM in our reference to “any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid.” However, the commenter urged CMS to always have the goal that any measure that has an evidence-based focus and is reliable and valid would also either: (1) be on the annual list of MIPS measures; (2) be endorsed by an consensus-based entity; (3) be a quality measure developed under section 1848(s) of the Act; or (4) be a quality measure submitted in response to the MIPS Call for Quality Measures. The commenter recommended that CMS clarify its intent to have no measure qualify as MIPS-comparable for more than 2 years based solely on meeting the specifications as “any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid.”

Response: We thank the commenters for their support and suggestion regarding the types of measures that we consider MIPS-comparable. We proposed that the quality measures on which the Advanced APM bases payment must include at least one of the following types of measures provided that they have an evidence-based focus, and are reliable and valid: (1) any of the quality measures included on the proposed annual list of MIPS quality measures; (2) quality measures that are endorsed by a consensus-based entity; (3) quality measures developed under section 1848(s) of the Act; (4) quality measures submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act; or (5) any other quality measures that CMS determines to have an evidence-based focus and be reliable and valid. We believe the fifth “principle” above provides us the flexibility to view a measure that is submitted to a consensus-based entity for endorsement as comparable to MIPS quality measures, even if the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

measure has not received endorsement at the time it is proposed for inclusion in the Advanced APM. We do not believe we need to combine principle number 5 with one of the other principles as long as the measure is reliable, valid and has an evidenced-based focus. We do not believe it is necessary to place a time limit on the use of a MIPS-comparable measure that does not already meet one of the four other principles. However, we would strongly encourage stakeholders to submit measures for inclusion on the MIPS measure list once they have been tested in an APM.

Comment: One commenter was opposed to the proposed definition of measures that are comparable to MIPS. The commenter did not agree with the proposed measure types for the MIPS-comparable set of quality measures, stating that CMS should not include quality measures that have merely “an evidence-based focus.” The commenter is concerned that CMS in the past has pressed for a quality measure that incentivizes lower quality care, under the guise of evidence and suggested it would be better for CMS to add additional considerations such as whether the measure has achieved its purpose to affect physicians’ behavior.

Response: The proposal to include an evidence-based focus as one of the requirements for measures to be comparable to MIPS measures is consistent with the statutory requirement for MIPS measures, except for those measures originating from a QCDR. While we believe that measures that qualify as MIPS-comparable under our proposed criteria can include measures that also have a demonstrable track record of influencing physician behavior, we do not believe it would be consistent with the MIPS statute to include this as a consideration.

Comment: A commenter recommended that CMS put in place a more robust framework to ensure that Advanced APMs utilize quality measures that accurately and reliably reflect the care an individual patient receives under these models. The commenter believes that, as Advanced APM participants bear financial risk for monetary losses that are in excess of a nominal amount, the quality measures in place are all the more important as a protection for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

patients against a narrow focus on cost-containment. The commenter was also concerned that CMS' proposed framework is not sufficient to ensure that Advanced APMs utilize robust quality measure sets, and that framework skews too much toward providing flexibility to these APMs. Another commenter encouraged CMS to continually look at measures that monitor for any perverse incentives that may occur as CMS experiments with Advanced APMs. For example, stinting on, or forgoing, care to save costs in the short term is a risk not usually prevalent in FFS, but could be a risk in certain Advanced APMs. In developing all APMs, the commenter stated that CMS should always ensure that they contain a quality component that meets the proposed criteria and that the measures in the APM reflect monitoring for the desired outcomes of the model.

Response: We assess all APM designs for possible perverse incentives and the potential for care stinting activities prior to implementation. We agree that we should continually monitor for perverse incentives and behaviors such as care stinting, and we actively perform these assessments now. We believe that both the inclusion of payment based on performance on quality measures in the Advanced APMs and the ongoing monitoring and evaluations conducted on all APMs are mechanisms for identifying whether appropriate care is withheld to save costs. The Advanced APM requirement for inclusion of MIPS-comparable measures does not represent a quality measure strategy for Advanced APMs. It is a statutory requirement that an APM must meet in order to be an Advanced APM. Rather, the Advanced APM quality strategy typically includes quality and/or utilization measures that correspond with the key payment and practice transformation activities being tested in the APM. This is why the majority of APMs include more than just one quality measure and many different types of quality performance measures (for example, process, clinical outcome, patient experience of care or patient reported outcome measures) to assess the clinical care provided by eligible clinicians under the APM. Our goal in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

developing APMs is to ensure that all patients realize better care, improved clinical outcomes and more efficient cost-effective care. We believe our existing quality standards and strategies promote these goals and the statutory requirement to include MIPS-comparable measures to be an Advanced APM further reinforces these goals.

Comment: One commenter requested additional transparency regarding the quality measures that an individual Advanced APM includes, and suggested that CMS should establish a webpage on which Advanced APMs will identify the quality measures they include and how these measures meet the “similar to” standard. This information should include: details of how the measure is calculated; its limitations; whether the measure is included in the current (or any former) MIPS measure sets; how the measure was developed, and by whom; and whether it is endorsed by a national standards-setting organization (for example, NQF).

Response: We appreciate this suggestion. Many, if not all, APMs include their quality measures list on either the CMS or Innovation Center website. Because the Advanced APM MIPS-comparable quality measure requirement is a new requirement, we will assess the need to develop a public-facing site with the information the commenter suggests.

Comment: Some commenters suggested CMS provide additional flexibility to Advanced APMs in the selection of outcome measures and measures used for specialty APMs. One commenter requested that CMS not require any outcome measures for 2 to 3 years. Yet another commenter agreed that all measures should have an evidence-based focus to be included in the Advanced APM.

Response: We believe the proposed criteria for inclusion of measures that are comparable to MIPS provides CMS and Advanced APMs the flexibility the commenter recommends. The measure(s) included to meet this criterion can be a measure on the MIPS measure list or can be selected from another program or source such as the list of consensus-endorsed measures

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

maintained by the NQF. We believe that outcome measures should be included in all APMs wherever possible and that there is no need to wait 2 to 3 years before including outcome measures in Advanced APMs. Presently, many APMs include one or more outcome measures in their quality measure set; therefore, we do not anticipate that this policy will prevent any APMs from being Advanced APMs in the first QP Performance Period.

Comment: One commenter expressed concern that providing Advanced APMs with the proposed degree of flexibility will allow quality performance to slip, and stated that current quality measures used by Advanced APMs fall short of providing useful information.

Response: Most APMs are designed to include quality and cost/utilization measures that are aligned with the goals of the APM, and that address the populations and clinical care delivered by the APM participants to their patients. However, there may be new APMs for which CMS would have limited quality measures to choose from that are reliable, valid and have an evidence-based focus. For example, models that target specific patient populations or a subset of services may have few relevant measures available. We believe the flexibility included in our proposed criteria will allow us to include measures that meet this requirement and continue to develop and implement new APMs in support of HHS' goals. Furthermore, most APMs include many types of measures that meet several of the criteria we proposed for Advanced APM "comparable to MIPS measures." These measures come from a variety of sources including other CMS programs, and the NQF list of endorsed measures and in some instances were vetted by external stakeholders and technical expert panels to ensure they were suitable for use in the APM.

Comment: One commenter asked for clarification as to whether non-MIPS measures approved for use in a QCDR qualify as MIPS comparable quality measures. A few commenters supported the use of QCDR measures for Advanced APMs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: Yes, measures that are already approved by CMS for use in a QCDR may also be used to meet this Advanced APM criterion as long as the non-MIPS QCDR measure is reliable, valid, and has an evidence-based focus.

Comment: One commenter requested clarification regarding submission methods available to APMs and Advanced APMs because the commenter believes that QCDRs and qualified registries should be available for submission of quality data. The commenter noted that the CMS Web Interface uses a sample of patients that represents a fraction of the APM Entity's overall patient population whereas QCDRs and qualified registries would be able to consolidate and submit a statistically relevant population of patients, that is, up to 90 percent of all patients across all payers. The commenter believes this would allow Advanced APMs and eligible clinicians in Advanced APMs to more accurately report on their population and compare themselves to MIPS eligible clinicians for purposes of finding actionable areas for quality improvement. The commenter also believes that QCDRs would be able to assist with development of measures specific to the goals of APMs and Advanced APMs.

Response: As proposed, QCDR measures are considered to be MIPS-comparable measures as long as the QCDR measure used in the APM is also evidence-based, reliable and valid. There may be some QCDR measures that do not meet the requirements to be reliable, valid, or have an evidence-based focus, and therefore, would not be considered comparable to MIPS quality measures for purposes of identifying Advanced APMs. When CMS designs new APMs, we must select specific submission method(s) for quality data within the policy and operational context of a given APM as well as the resources and systems available at CMS. Historically, this has included registry submission for some APMs. We hope that QCDRs will continue to develop new measures that both MIPS and other CMS programs can use to assess quality performance and appreciate their efforts to expand the inventory of measures available to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

our programs.

Comment: One commenter stated concern that the proposal creates an additional process for assessing quality measures when there are already other established processes that determined whether measures are evidence-based, reliable, and valid, such as the National Quality Forum (NQF) Measures Application Partnership (MAP).

Response: This proposal does not change the processes that are used by CMS to adopt measures for use in CMS programs. Rather the inclusion of an Innovation Center internal review process is to assess whether the measure meets the criteria to be a MIPS-comparable measure for purposes of identifying Advanced APMs. For example, there may be instances where CMS may elect to use a quality measure in the design of an APM to meet the MIPS-comparable measure criterion, and that measure is not currently included in the final list of MIPS measures for use in MIPS. Our proposed policy provides CMS the flexibility to identify a measure used in an APM as MIPS-comparable even if the measure is not used in MIPS as long as it meets the requirement that it is reliable, valid and has an evidence-based focus.

Comment: One commenter encouraged CMS to urge private payers to also adopt core measure sets, and other commenters requested that CMS consider appropriate Medicare Advantage quality measures. Commenters urged CMS to streamline and standardize its quality measures to focus on a core set of measures that are nationally endorsed and not overly burdensome to administer, and another commenter suggested that CMS have one process to determine acceptability of both APM measures and QCDR measures. Another commenter encouraged CMS to seek guidance from NQF in order to maintain a rigorous level of measure assessment. Several commenters suggested that CMS use measures developed by other entities, including the Core Quality Measure Collaborative, Qualified Clinical Data Registries (QCDRs) and NQF. One commenter indicated that measures in APMs vary widely and that there is no

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

consistency across APMs in obtaining stakeholder feedback on the quality measure sets; the commenter suggested the Measure Application Partnership (MAP) might be such a venue for obtaining stakeholder feedback in the future.

Response: We believe the proposed criteria for the MIPS-comparable measures used in Advanced APMs does not prevent an APM from using a core measure set or using measures developed and included in other CMS programs, but instead provides the criteria for what constitutes a MIPS-comparable measure to meet the Advanced APM requirement. As noted above, not all quality measures upon which an APM bases payment are required to be MIPS-comparable, and not all payments under the APM must be based on MIPS-comparable measures. However, at least some payments must be tied to MIPS-comparable measures, regardless of whether those measures are the only ones the APM uses. We agree with the commenters that the Core Quality Measure Collaborative, led by America's Health Insurance Plans (AHIP) is an excellent source of measures for inclusion in Advanced APMs and other CMS programs. We also agree that identifying a core set of measures to be used in Advanced APMs would have advantages, but recognize the need to allow for inclusion of measures that are appropriate to assess performance for the specific patient population, for which the Advanced APM participants are providing care. We have heard repeatedly from clinicians that they need specific measures that address their patient population and a single core set used by all Advanced APMs may not meet that goal. Because CMS typically identifies measures that are appropriate for use in APMs by first looking at measures used in other CMS programs we do not believe there needs to be a separate process for identifying measures for use in APMs that there is the need to obtain additional input from other entities such as the MAP. Consequently, we do not believe we need to establish additional reviews by external organizations to vet MIPS-comparable measures as these processes are already established for measures used in MIPS and other CMS programs, and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not all measures used in the Advanced APM need to be MIPS-comparable measures.

Comment: Several commenters supported measurement innovation and recommended engaging stakeholders in the development of quality measures. One commenter suggested that meeting measure requirements should not be tied to reporting a certain number of metrics. Some commenters also addressed specific types of APMs or potential APMs. For example, two commenters urged that CMS make modifications to BPCI so that it could become an Advanced APM. One commenter urged CMS to broaden the definition of how payments can be based on quality measures, which would allow for additional Advanced APMs. Specifically, the commenter referred to the CMS fact sheet that CMS is “committed to ensuring beneficiaries receiving care from providers participating in BPCI receive high quality care,” which supports the case that BPCI meets this criterion. Some commenters suggested new APMs and the development of relevant measures, such as palliative and end-of-life care and anesthesia.

Response: We appreciate the commenters’ support for emphasizing innovation in the development of quality measures and have already included this type of innovation in some of our new APMs, such as the Comprehensive Primary Care Plus (CPC+) model. We plan to develop one or more patient-reported outcome measures in CPC+ after it is implemented in 2017. We agree with the commenter that there is no need to specify the number of measures, and our proposed criteria for MIPS-comparable measures do not specify that a particular number of measures be used. We thank the commenters for their specific APM and measure suggestions, and remind readers of the PTAC, as described in section II.F.10. of this final rule with comment period. We also note that ideas for new APMs can be submitted directly to the CMS Innovation Center. Regarding BPCI, episode payments are based solely on episode spending performance, although we expect that reductions in spending would generally be linked to improved quality through reductions in hospital readmissions and complications. Building on the BPCI initiative,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the Innovation Center is considering new episode payment models that could meet the Advanced APM criteria, including the requirement to provide for payment based on MIPS-comparable quality measures, potentially including a new voluntary bundled payment model for CY 2018. The following is a summary of the comments we received regarding our proposal to establish an Innovation Center quality measure review process for those measures that are not NQF-endorsed or included on the final MIPS measure list to assess whether the quality measures have an evidence-based focus, are reliable, and are valid.

Comment: A few commenters supported the proposal to create an Innovation Center quality measure review process for measures that are not NQF-endorsed or on the final MIPS measure list.

Response: We appreciate the commenters' support of the proposal to create an Innovation Center quality measure review process for measures that are not NQF-endorsed or on the final MIPS measure list.

Comment: One commenter requested that, to the extent that CMS moves forward with the proposed Innovation Center quality measure review process, the Agency should identify the details of the process (for example, timelines, standards for consideration/approval, and opportunities for stakeholder input), and allow stakeholders the chance to comment on those details before the process is finalized.

Response: We do not believe a formal mechanism for public input is necessary or appropriate in this case. We note that this process is intended merely to make a factual determination of whether a measure meets the Advanced APM criterion articulated in this final rule. This process will not determine which measures are included in APMs, nor will it determine how these measures will be linked to payment under an APM. Those determinations will be made and communicated through APM documents. In the case of APMs that are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

mandatory for participants, these decisions will continue to be made through rulemaking with opportunity for public comment.

The following is a summary of the comments we received regarding our proposal to require that an Advanced APM must include at least one outcome measure if an appropriate measure is available on the MIPS list of measures for that specific QP Performance Period, as determined at the time when the APM is first established.

Comment: Commenters generally supported the proposal to require at least one outcome measure. One commenter requested we delay this requirement until future years of the program. One commenter supported flexibility in allowing those designing the Advanced APM to select and/or design the most appropriate outcome measures for that Advanced APM. Another commenter expressed support for not requiring an outcome measure if no applicable measures are available at the time an Advanced APM is established. Alternatively, two commenters suggested that at least one outcome measure be included even if there was no applicable outcome measure on the MIPS final list of measures.

Response: We thank commenters for their support of the proposal to include the requirement for one outcome measure in the Advanced APM if an appropriate measure is available on the MIPS list of measures for that specific QP Performance Period at the time the APM is first established. We proposed that if no appropriate outcome measure is available on the MIPS list at the time the APM is established, the APM does not need to include an outcome measure. Furthermore, if there is a MIPS outcome measure available on the MIPS list for that specific QP Performance Period, but CMS determines there is another more appropriate non-MIPS outcome measure, the non-MIPS outcome measure can be used. Given the dearth of appropriate outcome measures for some specialties, we believe it is reasonable at this time to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

maintain the policy as proposed requiring inclusion of an outcome measure in Advanced APMs only if there is an appropriate measure included on the MIPS final measure list at the time the APM is first established.

We are finalizing as proposed that to be an Advanced APM, an APM must base payment on quality measures that are evidence-based, reliable, and valid; and that at least one such measure must be an outcome measure unless there is not an applicable outcome measure on the MIPS quality measure list at the time the APM is developed. The required outcome measure does not have to be one of those on the MIPS quality measure list. We are also finalizing the proposal to establish an internal Innovation Center quality measure review process for measures that are not NQF-endorsed or on the final MIPS measure list in order to assess whether the measures meet these criteria.

### (3) Financial Risk for Monetary Losses

#### (a) Overview

The third criterion that an APM must meet to be an Advanced APM is that it must either be a Medical Home Model expanded under section 1115A(c) of the Act as described below, or the APM Entities under the APM must bear financial risk for monetary losses under such APM that are in excess of a nominal amount. We refer to the latter criterion as the “financial risk criterion.” The correlating financial risk criterion for Other Payer Advanced APMs is described in section II.F.7. of this final rule with comment period along with the requirements for consideration under the All-Payer Combination Option that is applicable in payment years 2021 and later.

The financial risk criterion we proposed for Advanced APMs would apply to the design of the APM financial risk arrangement between CMS and the participating APM Entity. If the structure of the arrangement meets the proposed financial risk requirements, then this criterion

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

would be met. This proposal would not impose any additional performance criteria related to bearing financial risk. For example, eligible clinicians under the Advanced APM Entity would not need to bear financial risk under the APM so long as the APM Entity bears that risk. Furthermore, an APM Entity would not need to actually achieve savings or other metrics for success under the APM in order for the APM to meet this criterion.

In describing our proposal, we divided the discussion into two main topics: (1) what it means for an APM Entity to bear financial risk for monetary losses under an APM; and (2) what levels of risk we would consider to be in excess of a nominal amount. In developing our proposed policies we prioritized keeping these standards consistent across different types of APMs, including Other Payer Advanced APMs as described in section II.F.7.b.(6) of this final rule with comment period. We believe that keeping these standards consistent to the extent possible would make it easier for stakeholders, APM Entities, and eligible clinicians to understand the type of financial risk required for an APM to be an Advanced APM. However, we proposed to specify small variations in the requirements to accord with the differing characteristics of certain types of APMs.

#### (b) Bearing Financial Risk for Monetary Losses

We proposed a generally applicable financial risk standard for Advanced APMs and a unique standard that would apply only for Advanced APMs that are identified as Medical Home Models.

##### (i) Generally Applicable Advanced APM Standard

First, we proposed that the generally applicable financial risk standard for Advanced APMs would be that an APM must include provisions that, if actual expenditures for which the APM Entity is responsible under the APM exceed expected expenditures during a specified performance period, we can:

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Withhold payment for services to the APM Entity and/or the APM Entity’s eligible clinicians;
  - Reduce payment rates to the APM Entity and/or the APM Entity’s eligible clinicians;
- or
- Require the APM Entity to owe payment(s) to CMS.

The proposed financial risk standard for Advanced APMs reflected our interpretation of the statutory requirement that Advanced APM Entities must bear financial risk for monetary losses to encompass “losses” that could be incurred through either direct repayments to CMS or reductions in payments for services. The former would cover two-sided risk arrangements such as shared savings initiatives in which an Advanced APM Entity may receive shared savings or be liable for shared losses. The latter would cover a range of alternative methods for linking performance to payment, such as payment withholds subject to successful performance, or discounts in payment rates retrospectively applied at reconciliation similar to those in many episode-based bundled payment models.

We solicited comments on how we could potentially create an objective and meaningful financial risk criterion that would define financial risk for monetary losses differently.

The following is a summary of the comments we received regarding our proposal for the generally applicable Advanced APM financial risk standard.

Comment: Many commenters expressed support for the proposed generally applicable Advanced APM financial risk standard as meaningful and appropriate. In particular, commenters supported that the standard only captures APMs with downside financial risk. Some commenters believe that all APMs should have downside risk or capitation-style payment arrangements in order to spur greater transformation and better value to consumers. Other commenters agreed with that sentiment, but believed that movement to downside risk takes time and requires an on-

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

ramp or path for clinicians to move to greater levels of risk. Some commenters also supported our proposal to focus the financial relationship between CMS and the APM Entity, rather than downstream risk relationships between the APM Entity and its participants, when assessing whether an APM satisfies the financial risk standard.

Some commenters suggested that we increase the rigor of the financial risk standard so that Advanced APM performance is considered in addition to its financial risk design. For instance, an Advanced APM would have to demonstrate that its payment model is driving care delivery improvements for better outcomes and patient experience. They also suggested design changes for APMs such as enhancing consumer protections as APMs expand in scope or allowing sharing savings with beneficiaries.

Response: We appreciate the general support for the design of the generally applicable financial risk standard. We agree that downside risk is an important distinction and an aspect of APM design that can contribute to improved costs and outcomes for beneficiaries. We also recognize that developing risk-bearing capacity is a long-term undertaking and that entities are currently at different states of readiness for bearing risk. Therefore, as we discuss throughout this final rule, we have emphasized technical assistance for small and rural practices and intend to offer an array of APMs and Advanced APMs so that clinicians can find the right fit for their practice now and in the future.

For suggestions that we add more layers of requirements for an APM to become an Advanced APM, we do not believe that is the purpose of the APM incentive. In particular, as stated in our principles under section II.F.1. of this final rule with comment period, we believe the APM Incentive Payment is a time-limited incentive (with the combination of the favorable fee schedule update and the potential rewards inherent to APMs being the long-term incentives) intended to encourage movement into the most challenging and potentially most rewarding

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APMs available as defined by the three Advanced APM criteria described in this section. Each APM has many unique characteristics other than those involving CEHRT use, quality measurement, and financial risk, and we believe that it is important to support rather than constrain flexibility in APM design to the extent feasible. Additionally, we assess all of our APMs continuously, and the measurable success of an APM will determine our ability to expand it in the future, not whether the APM is determined to be an Advanced APM. Moreover, the ultimate evaluation of APM success is: (1) retrospective in nature, so that if Advanced APM status were to hinge on such results, an APM's status would be uncertain until several years after its launch; and (2) distinct from the challenge of participating in a model with CEHRT use requirements, payment based on MIPS-comparable quality measures, and more than nominal financial risk.

Regarding the comments on consumer protections, just as each APM has its own set of requirements and rewards, it also has its own set of program integrity protections, in addition to those for the overall Medicare program, in which we operate rigorous monitoring programs for each APM.

Comment: Conversely, other commenters expressed their desire for CMS to consider costs not explicitly part of the financial risk arrangement of an APM as financial risk for purposes of this standard. The APM status of Track 1 of the Shared Savings Program was particularly salient for commenters in this respect. For instance, two commenters believe that CMS should consider Track 1 ACOs that have demonstrated high quality of care with quality performance scores of 86 percent or greater and generated cost savings that exceed their minimum savings rate to be participating in an Advanced APM. Many commenters cited up-front costs or investments in infrastructure and care redesign related to the pursuit of success under the APM incurred by ACOs participating under Track 1. Some of these "business risk"

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

costs can include IT acquisition, hiring of care coordination and case management personnel, business and clinical process development, population management analytics, and other administrative costs. Some commenters believe that any operational costs related to APM participation should be considered risk. One commenter suggested that CMS consider Track 1 ACOs in Maryland that are subject to the Maryland All-Payer Model to be bearing downside risk.

Some commenters similarly suggested that uncompensated care costs be considered financial risk. Other commenters suggested that we use the Medical Home Model financial risk standard for all APMs, such that the Track 1 adjustment to shared savings based on quality scores would be considered financial risk. Another commenter recommended that APMs that do not have downside risk be considered Advanced APMs for the first 2 years of the Quality Payment Program.

One commenter submitted research suggesting that there is limited uptake and performance in ACOs with downside risk in comparison to Track 1 of the Shared Savings Program, and recommended that CMS recognize the shortcomings of the current two-sided ACO risk models and develop a new APM that includes more appropriate levels of risk. One commenter believes the proposed financial risk standard is inconsistent with the statutory intent to encourage proliferation of, and participation in, Advanced APMs. One commenter suggested that the focus of the financial risk standard should be on the motivation of APM participants to reduce costs rather than whether or not they bear financial risk.

Response: We appreciate the comments suggesting broadening the scope of the Advanced APM financial risk standard, which appear to be largely driven by the desire to identify Track 1 of the Shared Savings Program as an Advanced APM. We recognize the substantial time and money commitments that APM Entities invest to become successful APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participants. However, we disagree with commenters that costs not encompassed by an APM's financial risk arrangements should be considered when assessing financial risk under the APM. First, we do not believe we can objectively and accurately assess business risk without exceptional administrative burden on both CMS and APM Entities to quantify such expenditures and verify that they were made solely for participation in a particular APM. Any such assessment would be at risk of being methodologically unsound because we do not believe we could set simple, clear standards for which expenditures would be included as "business risk" for the purposes APM participation and not also of benefit to other activities that a practice may engage in.

Second, although the cited activities and investments may be geared toward success in an APM, we believe the same activities and investments are likely to be aligned with success under any value-based payment system such as MIPS.

Third, business risk is generally a sunk cost that is unrelated to performance-based payment under an APM. No matter how well or poorly an APM Entity performs, those costs are not reduced or increased correspondingly. Therefore, business "risk" is not analogous to performance risk in the APM context because those activities and investments are simply costs that are not incorporated into the financial calculations of an APM. In fact, we believe the placement of any objective monetary standard for how much investment could be considered more than nominal would inherently offer an incentive for excessive or wasteful investment that might be unrelated to performance.

We also believe that maintaining a clear distinction between APMs and Advanced APMs is consistent with the statute, which did not envision that all APMs would meet this standard. We believe that section 1833(z) of the Act recognizes that not all APMs would meet this criterion.

We believe the purpose of the APM incentives is to provide a boost for participation in the most

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

challenging APMs, not to provide funding for infrastructure support for participation in any APM. Several APMs such as the ACO Investment Model, Next Generation ACO Model, and CPC+ model have those investment funds built into the APM.

In addition, we have a stated interest in encouraging movement from one-sided risk arrangements to two-sided risk arrangements, that is, for example from Track 1 to Track 2 or 3 of the Shared Savings Program. Designating a Track 1 ACO as an Advanced APM by permitting business risk to meet the financial risk standard would provide no additional incentive for Track 1 ACOs to transition to two-sided risk models.

With respect to uncompensated care, we do not wish to downplay the financial impact of uncompensated care, but we believe that addressing such costs in the context of APMs is beyond the scope of this final rule with comment period. We do not believe that such costs can be considered as financial risk under an APM in any systematic, quantifiable manner. Even more than with business risk, we do not believe uncompensated care can be considered “monetary losses under such alternative payment model” as stated in section 1833(z)(3)(D)(ii)(I) of the Act. Further, we do not believe that an APM Entity that provides uncompensated care and also participates in an APM that does not meet the financial risk criterion should be considered to be participating in an Advanced APM. Losses resulting from the provision of uncompensated care would be unrelated to the performance requirements under the APM.

With respect to the Medical Home Model financial risk standard, we believe that it is important to maintain the distinction between Medical Home Models and other APMs because we believe that Medical Home Models are categorically different than other types of APMs, as supported by specific provisions in the statute enabling unique treatment of Medical Home Models. Also, Medical Home Model participants tend to be smaller in size and have lower Medicare revenues relative to total Medicare spending than other APM Entities, which affects

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

their ability to bear substantial risk, especially in relation to total cost of care. We believe that the meaning of nominal financial risk varies according to context, and that smaller practices participating in Medical Home Models, as a category, experience risk differently than much larger, multispecialty-focused organizations do. To date, Medical Home Model participants have not been required to bear financial risk, which means the assumption of any financial risk presents a new challenge for these entities. We are providing special standards for Medical Home Models that are exceptions to the generally applicable standards because of these unique characteristics.

Comment: Many commenters suggested two additional interrelated policies to improve access to Advanced APMs. First, many commenters requested that we amend the Shared Savings Program regulations so that ACOs may move from Track 1 to either Track 2 or Track 3 prior to the completion of their 3-year agreement period in order to allow ACOs to accept downside risk and participate in an Advanced APM sooner than they otherwise would be able. Some commenters suggested that this be a one-time opportunity in order to allow ACOs the chance to move “up” to a higher track. Other commenters requested an extension of the application cycle for 2017 participation in the Shared Savings Program.

Several commenters suggested that we create a new Shared Savings Program track that closely aligns with the finalized Advanced APM nominal amount standard in this final rule so that there is an option for ACOs, particularly ACOs with relatively low revenue or small numbers of participating eligible clinicians, to participate in an Advanced APM without accepting the higher degrees of risk involved in Tracks 2 and 3. Commenters believe this would be an attractive and meaningful middle path between Tracks 1 and 2 and would be a viable on-ramp for assuming greater amounts of risk in the future. Commenters suggested this opportunity should be coupled with the ability for Track 1 ACOs to move into this new “Track 1.5” before

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the end of their current agreement periods. Another commenter specifically suggested an asymmetrical ACO model with a low marginal risk rate for losses, such as 25-30 percent of shared losses, and a higher marginal risk rate for savings, such as 70-75 percent of shared savings, with no minimum savings rate or minimum loss ratio.

Response: We thank the commenters for their suggestions and comments regarding how to align the Shared Savings Program rules with the Quality Payment Program and enhance the opportunities for ACOs to participate in an Advanced APM. In the November 2011 final rule establishing the Shared Savings Program (76 FR 67909) as updated in the June 2015 final rule (80 FR 32692), we have created three tracks in which ACOs can choose to participate: A one-sided risk model (Track 1) that incorporates the statutory payment methodology under section 1899(d) of the Act; and two, two-sided models (Tracks 2 and 3) that are also based on the payment methodology under section 1899(d) of the Act but incorporate performance-based risk using the authority under section 1899(i)(3) of the Act to use other payment models. We explained that offering a choice of tracks would create an “on-ramp” for the program to attract both providers and suppliers that are new to value-based purchasing, as well as more experienced entities that are ready to share performance-based risk. We stated our belief that the one-sided model would have the potential to attract a large number of participants to the program and introduce value-based purchasing broadly to providers and suppliers, many of whom may never have participated in a value-based purchasing initiative before. Another reason we included the option for a one-sided track with no downside risk was that this model would be accessible to and attract small, rural, safety net, and physician-only ACOs.

However, we also noted that although a one-sided model could provide incentives for participants to improve quality, it might not be sufficient incentive for participants to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

improve the efficiency and cost of health care delivery (76 FR 67904 and 80 FR 32759).

Therefore, we have used our authority under section 1899(i)(3) of the Act to create two performance-based risk options, Track 2 and Track 3, where ACOs are not only eligible to share in savings, but also must share in losses. We believe performance-based risk options have the advantage of providing more experienced ACOs an opportunity to enter a sharing arrangement that provides greater reward for greater responsibility, and we have designed our policies for the Shared Savings Program to offer a pathway for ACOs to transition from the one-sided model to performance risk-based arrangements. Therefore, we require that ACOs that elect to enter the Shared savings Program under Track 1 can remain in Track 1 for no longer than 2 agreement periods, and must transition to Track 2 or Track 3 for all subsequent agreement periods. We believe this approach increases interest in the Shared Savings Program by providing a gentler on-ramp while maintaining the flexibility for more advanced ACOs to take on greater performance-based risk in return for a greater share of savings immediately upon entering the program.

Many of the program requirements that apply to ACOs in Tracks 1, 2, and 3 are the same but there are some significant differences that encourage progression along the risk continuum. For example, the financial reconciliation methodology was designed so that ACOs that accept performance-based risk under Track 2 or Track 3 have the opportunity to earn a greater share of savings, in exchange for their willingness to accept performance-based risk. Specific differences between the tracks are summarized in the June 2015 final rule at (80 FR 32811 through 32812).

In June 2016, we issued a final rule (81 FR 37950) to incorporate regional FFS expenditures into the methodology for establishing, adjusting, and updating the benchmarks of ACOs that continue their participation in the Shared Savings Program after an initial 3-year

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

agreement period. In an effort to continue to provide a pathway to increasing performance-based risk, the June 2016 final rule also added a participation option to encourage ACOs to transition to performance-based risk arrangements. Specifically, in the June 2016 final rule, we finalized a policy to give ACOs that participate in Track 1 for their first agreement period an additional option when they apply to renew for a second agreement period under a two-sided model (Track 2 or Track 3). If the ACO's renewal request is approved, the ACO may request that its initial participation agreement under Track 1 be extended for an additional year (that is, the ACO would enter a fourth performance year under Track 1). As a result of this deferral, we will also defer rebasing the ACO's benchmark for 1 year. At the end of this fourth performance year under Track 1, the ACO will transition to the selected performance-based risk track for a three-year agreement period. This option became available beginning with the 2017 application cycle.

However, even with this pathway to performance-based risk, we have heard from stakeholders, as exemplified by the comments above, that we should consider offering ACOs an even more gradual transition to performance-based risk. In the June 2016 final rule, we signaled that we are committed to facilitating entry and continued participation in the Shared Savings Program by ACOs with varying levels of experience with accountable care models and differing degrees of readiness to take on performance-based risk, and to encourage ACOs to transition to performance-based risk tracks. Given that the overwhelming majority of ACOs still participate in the one-sided model, we continue to explore how to move ACOs to performance-based risk more quickly.

Therefore, we are considering using our authority under section 1115A of the Act to develop and test a "Medicare ACO Track 1+ Model" starting for the 2018 performance year. The Track 1+ Model would test a payment model that incorporates more limited downside risk than is currently present in Tracks 2 or 3 of the Shared Savings Program in order to encourage more

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

rapid progression to performance-based risk. In other words, this potential Track 1+ Model is envisioned as an on-ramp to Tracks 2 or 3. The model could be open to Track 1 ACOs that are within their current agreement period, initial applicants to the Shared Savings Program, and Track 1 ACOs renewing their agreement that meet model eligible criteria. The model would be voluntary for organizations currently participating in Track 1 or seeking to participate in the Shared Savings Program. For Track 1 ACOs that have renewed their agreements, the benchmark that would apply under the model could also incorporate a regional benchmark adjustment consistent with the timing and phase-in of the regional benchmark adjustment as outlined in the June 2016 final rule for the Shared Savings Program. We will announce additional information about the Track 1+ Model in the future.

We are finalizing the Advanced APM financial risk standard as proposed. To be an Advanced APM, an APM must provide that, if actual expenditures for which an APM Entity is responsible under the APM exceed expected expenditures during a specified performance period, CMS can:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;
  - Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;
- or
- Require the APM Entity to owe payment(s) to CMS.

We note that this generally applicable financial risk standard does not include reductions in otherwise guaranteed payments made under the terms of the APM—such as care management fees that vary based on quality performance—whereas, as described below, the Medical Home Model financial risk standard does take into consideration reductions in otherwise guaranteed payments under certain circumstances. As such, one-sided risk arrangements would not meet this

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

financial risk criterion.

(ii) Medical Home Model Financial Risk Standard

We proposed to adopt a slightly different financial risk standard for Medical Home Models. For a Medical Home Model to be an Advanced APM, it must include provisions that CMS:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;
- Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;
- Require the APM Entity to owe payment(s) to CMS; or
- Cause the APM Entity to lose the right to all or part of an otherwise guaranteed payment or payments, if either:

++ Actual expenditures for which the APM Entity is responsible under the APM exceed expected expenditures during a specified performance period; or

++ APM Entity performance on specified performance measures does not meet or exceed expected performance on such measures for a specified performance period.

With regard to the proposed financial risk standard for Medical Home Models, we believe that the Medical Home Model is a unique type of APM that is treated differently under both the MIPS and APM programs. For example, under the MIPS clinical practice improvement activity performance category, as described in section II.E.3.f. of this final rule with comment period, eligible clinicians participating in medical homes receive an automatic 100 percent score, whereas eligible clinicians participating in other APM Entities receive a minimum of a 50 percent score. Additionally, Medical Home Models are distinct from other APMs in that, if they are models tested under section 1115A of the Act, there is the possibility of having an alternate pathway to meet the financial risk criterion through expansion under section 1115A(c) of the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Act; and the presence of Medicaid Medical Home Models in a state can affect whether Medicaid payments or patients are excluded in the All-Payer Combination Option for QP determinations (see sections 1833(z)(2)(B)(ii)(I)(bb) and (iii)(II)(cc)(BB), 1833(z)(2)(C)(ii)(I)(bb) and (iii)(II)(cc)(BB), 1833(z)(3)(C)(ii)(II), and 1848(q)(5)(C)(i) of the Act). Medical Home Models and their participating APM Entities (medical homes) are different from other APMs and their respective APM Entities in that: (1) medical homes tend to be smaller in size and have lower Medicare revenues relative to total Medicare spending than other APM Entities, which affects their ability to bear substantial risk, especially in relation to total cost of care; and (2) to date, neither publicly nor commercially-sponsored medical homes have been required to bear the risk of financial loss, which means the assumption of any financial risk presents a new challenge for medical homes. For example, a common group practice in the Comprehensive Primary Care (CPC) initiative may consist of less than 20 individuals, including physicians, non-physician practitioners, and administrative staff. Making large lump sum loss payments or going without regular payment for a substantial period of time could put such practices out of business, whereas large ACOs may comprise an entire integrated delivery system with sufficient financial reserves to weather direct short-term losses.

We therefore believe that the unique characteristics of Medical Home Models warrant the application of a financial risk standard that reflects these differences to provide incentives for participation in the most advanced financial risk arrangements available to medical homes practitioners.

The proposed financial risk standard for Medical Home Models is similar to the generally applicable Advanced APM standard in its first three conditions. The difference is in the inclusion of the fourth condition for the proposed financial risk standard for Medical Home Models, which would allow a performance-based forfeiture of part or all of a payment under an APM to be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

considered a monetary loss. For example, a Medical Home Model would meet this standard if it conditions the payment of some or all of a regular care management fee to APM Entities upon meeting specified performance standards. Because the APM does not require any direct payment or repayment to us, a medical home penalized in such a manner would not necessarily be in a weaker financial position than it had been prior to the decreased payment; however, it would be in a comparatively worse position in the future than it otherwise would have been had it met performance standards. We believe that this financial risk standard respects the unique challenges of medical homes in bearing risk for losses while maintaining a more rigorous standard than business risk.

We solicited comment on the proposed standards set forth for both Advanced APM Medical Home Models and for all other APMs, including any comments on alternative standards suggested by the public that could achieve our stated goals and the statutory requirements. We also solicited comment on types of financial risk arrangements that may not be clearly captured in this proposal.

The following is a summary of the comments we received regarding our proposal for a unique Advanced APM financial risk standard for Medical Home Models.

Comment: Many commenters believe that Medical Home Models should not have any financial risk requirement in order to be an Advanced APM. As with the generally applicable financial risk standard, commenters cited up-front costs related to participation. Some commenters also stated a belief that the proposed rule inappropriately imposes financial risk upon clinicians and could have unintended consequences for those serving vulnerable populations. Other commenters believe that instead of a separate risk standard for Medical Home Models, we should more generally focus on developing APMs for small organizations and consider targeted accommodations for rural practices.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: As with the comments suggesting that we consider expenses and investments related to the APM, we appreciate the desire to expand the availability of Advanced APMs but ultimately believe that considering these as financial risk would not respect the statutory distinction between APMs and Advanced APMs. However, the Medical Home Model financial risk standard acknowledges that risk under the terms of an APM can be structured uniquely for smaller entities participating in Medical Home Models in a way that offers the potential for losses without threatening their financial viability.

We disagree with comments stating that the statute supports no financial risk for Medical Home Model participants. Section 1833(z)(3)(D)(ii)(II) of the Act is clear that a Medical Home Model must be actually expanded under section 1115A(c) of the Act to meet the financial risk criterion without requiring APM Entities to bear more than nominal financial for monetary losses. The expanded Medical Home Model aspect of the financial risk criterion is described in full below in section II.F.4.(b) of this final rule with comment period.

We also disagree that our financial risk criterion for Medical Home Models to be Advanced APMs imposes undue risk on clinicians. This financial risk requirement only pertains to how a Medical Home Model must generally be structured in order to be an Advanced APM. There is no requirement that all Medical Home Models be Advanced APMs, and, to date, we have not created any mandatory Medical Home Models. Clinicians receive substantial credit under MIPS in the improvement activities performance category for participation in Medical Home Models or receiving certain certified patient-centered medical home certifications, regardless of whether they participate in an Advanced APM.

In fact, the financial risk policy that we finalize here for Medical Home Models is an exception to the generally applicable rule in recognition that Medical Home Models are categorically different than other types of APMs. However, we do not have the authority to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

dispense with the statutory requirement that an Advanced APM is one in which participating APM Entities bear more than nominal financial risk for monetary losses unless the APM is a Medical Home Model expanded as permitted under section 1115A(c).

Lastly, we agree with commenters that we should focus on improving APM and Advanced APM participation opportunities for small and rural practices. However, we do not believe that pursuing those goals is mutually exclusive with creating Advanced APM participation opportunities through the Medical Home Model financial risk standard.

Comment: Some commenters expressed their support for the separate Medical Home Model financial risk standard as placing a high value on the provision of primary care, and offered suggestions for further improvements such as improving the Relative Value Unit system that undergirds payment under the PFS even as we move away from entirely FFS payment. Other commenters supported the Medical Home Model financial risk standard but suggested that the entire financial risk criterion not apply to Medical Home Models until the 2018 QP Performance Period.

Response: We thank the commenters for their support of the proposed policy, but note that modifying the RVU system under the PFS is beyond the scope of this final rule with comment period. We also appreciate the suggestion to delay the application of the financial risk criterion but do not believe that we have the authority to set aside the statutory criterion. Nevertheless, a delay in the assessment of the financial risk criterion for Medical Home Models to be considered Advanced APMs would not change any risk requirements imposed by the Medical Home Models. Risk is a component of the design of the APMs themselves, not something imposed by the Quality Payment Program. For instance, the financial risk for participants under the CPC+ model will be the same regardless of whether or not the model meets the Advanced APM financial risk criterion.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are finalizing the Advanced APM financial risk standard for Medical Home Models as proposed. For a Medical Home Model to be an Advanced APM, it must include provisions such that CMS could:

- Withhold payment for services to the APM Entity and/or the APM Entity’s eligible clinicians;
- Reduce payment rates to the APM Entity and/or the APM Entity’s eligible clinicians;
- Require the APM Entity to owe payment(s) to CMS; or
- Cause the APM Entity to lose the right to all or part of an otherwise guaranteed payment or payments,

if either:

- Actual expenditures for which the APM Entity is responsible under the APM exceed expected expenditures during a specified performance period; or
- APM Entity performance on specified performance measures does not meet or exceed expected performance on such measures for a specified performance period.

#### (4) Nominal Amount of Risk

If the APM risk arrangement meets the proposed financial risk standard, we would then consider whether the amount of the risk is in excess of a nominal amount in order for this Advanced APM criterion to be met. We believe the statutory requirement that an APM Entity bear risk under an APM in excess of a nominal amount (which we would term the “nominal amount standard”) relates to a particular quantitative risk value at which we would consider the risk arrangement to involve potential losses of more than a nominal amount. Similar to the financial risk portion of this assessment, we proposed to adopt a generally applicable nominal amount standard for Advanced APMs and a unique nominal amount standard for Medical Home Models. Under the proposed generally applicable nominal amount standard, the total risk

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

percentages are of the APM Entity benchmark or, in the case of episode payment models, the target price, which is the amount of Medicare expenditures (which can vary as to the involvement of Parts A and B depending on the APM) above which an APM Entity owes losses and below which an APM Entity earns savings. In the case of Medical Home Models, the proposed risk percentages for Medical Home Models are based on Medicare Parts A and B revenue. As an alternative, we considered assessing total risk under the generally applicable nominal amount standard (for APMs other than episode payment models) in relation to the APM Entity's Parts A and B revenue instead of in relation to the APM benchmark. We note that the ratio between entity revenue and the expenditures reflected in an APM's benchmark may vary across different types of entities, such as when the APM benchmark is based on total cost of care. We did not propose, but we sought comment on, the alternative of basing the generally applicable standard on Parts A and B revenue. We were concerned that assessing total risk based on an APM Entity's revenue instead of the APM benchmark could require case-by-case determinations at the APM Entity level that could change from year to year, and would set meaningfully different standards for different types of entities regarding the extent to which they must be held financially responsible if expenditures exceed the benchmark. That said, we understand that setting the total risk standard too high could create challenges for smaller organizations for which a total cost of care benchmark represents more risk in relation to revenue than it does for larger organizations.

(a) Advanced APM Nominal Amount Standard

In general, we believe that the meaning of "nominal" is, as plain language implies, minimal in magnitude. However, in the context of financial risk arrangements, we do not believe it to be a mere formality. For instance, we do not believe the law was intended to consider one dollar of risk to be more than nominal. That would create an arbitrary distinction between an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM that has only upside reward potential and one that has the same upside reward potential with a fractional and relatively meaningless downside risk. Therefore, in arriving at the proposed values, we sought amounts that would be meaningful for the entity but not excessive. As reference points to anchor the proposed values, we used the percentage amounts of MIPS adjustments in the MACRA and surveyed current APM risk arrangements, including those in Tracks 2 and 3 of the Shared Savings Program, the Pioneer ACO Model, and the Bundled Payments for Care Improvement (BPCI) Initiative. We considered the potential losses and marginal risk rates of those initiatives to be optimal in that they have been vetted through the APM development process and determined to be the appropriate amount of risk for each initiative such that, in the context of the APM, it is anticipated that the amount of risk would motivate the desired changes in care patterns to reduce costs and improve quality. As stated previously, we believe that the term “nominal” is clearly an amount that is lower than optimal but substantial enough to drive performance. In other words, we are confident that risk levels in current APMs with downside risk are sufficient for a wide variety of providers and suppliers, but in certain circumstances, we would want to encourage participation in APMs with slightly lower levels of risk, though not levels of risk that are so low that an APM becomes no more effective at motivating desired changes than APMs with no downside risk.

Except for risk arrangements described under section II.F.4.b.(4) of this final rule with comment period, we proposed to measure three dimensions of risk described in this section to determine whether an APM meets the nominal amount standard: (a) marginal risk, which is a common component of risk arrangements—particularly those that involve shared savings—that refers to the percentage of the amount by which actual expenditures exceed expected expenditures for which an APM Entity would be liable under the APM; (b) minimum loss rate (MLR), which is a percentage by which actual expenditures may exceed expected expenditures

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

without triggering financial risk; and (c) total potential risk, which refers to the maximum potential payment for which an APM Entity could be liable under the APM. Except for risk arrangements described under section II.F.4.b.(3) of this final rule with comment period, we proposed that for an APM to meet the nominal amount standard the specific level of marginal risk must be at least 30 percent of losses in excess of expected expenditures, and a minimum loss rate, to the extent applicable, must be no greater than 4 percent of expected expenditures, and total potential risk must be at least 4 percent of expected expenditures. As described in greater detail in section II.F.7. of this final rule with comment period, the proposed Other Payer Advanced APM nominal amount standard paralleled the proposed standard described here for Advanced APMs. In general, we proposed to define expected expenditures to be the level of expenditures reflected in the APM benchmark. However, for episode payment models, we proposed to define expected expenditures to be the level of expenditures reflected in the target price.

To determine whether an APM satisfies the marginal risk portion of the nominal amount standard, we would examine the payment required under the APM as a percentage of the amount by which actual expenditures exceeded expected expenditures. We proposed that we would require that this percentage exceed the required marginal risk percentage regardless of the amount by which actual expenditures exceeded expected expenditures. APM arrangements with less than 30 percent marginal risk would not meet the nominal amount standard. We believed that meaningful risk arrangements can be designed with marginal risk rates of greater than 30 percent. We believed that any marginal risk below 30 percent could create scenarios in which the total risk could be very high, but the average or likely risk for an APM Entity could actually be very low. We also proposed that the payment required by the APM could be smaller when actual expenditures exceed expected expenditures by enough to trigger a payment greater than or equal

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

to the total risk amount required under the nominal amount standard. This was essentially an exception to the marginal risk requirement so that the standard would not effectively require APMs to incorporate total risk greater than the amount required by the total risk portion of the standard.

We proposed a maximum allowable “minimum loss rate” (MLR) of 4 percent in which the payment required by the APM could be smaller than the nominal amount standard would otherwise require when actual expenditures exceed expected expenditures by less than 4 percent; this exception accommodates APMs that include zero risk with respect to small losses but otherwise satisfy the marginal risk standard. If actual expenditures exceed expected expenditures by an amount exceeding the MLR, then all excess expenditures (including excess expenditures within the MLR) would be subject to the marginal risk requirements. For example, ACOs participating in performance-based risk arrangements under Tracks 2 and 3 of the Shared Savings Program are permitted to choose their own minimum savings rate (MSR) and MLR between zero and 2.0 percent or a variable MSR and MLR up to 3.9 percent based on the number of assigned beneficiaries as long as the MSR and MLR are symmetrical. If losses do not exceed the chosen MLR, the ACO is not held responsible for losses. If the ACO has a very large MLR, there may be little to no risk with respect to losses below a certain percentage of the benchmark. Therefore, we believed it was appropriate to propose a maximum allowable MLR. We recognize that there may be instances where an APM could satisfy the marginal risk portion of the nominal amount standard even with a high MLR. Therefore, we also proposed a process through which we could determine that a risk arrangement with an MLR higher than 4 percent could meet the nominal amount standard, provided that the other portions of the nominal amount standard are met. In determining whether such an exception would be appropriate, we proposed to consider:

- (1) whether the size of the attributed patient population is small;
- (2) whether the relative

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

magnitude of expenditures assessed under the APM is particularly small; and (3) in the case of a test of limited size and scope, whether the difference between actual expenditures and expected expenditures would not be statistically significant even when actual expenditures are 4 percent above expected expenditures. We noted that we would grant such exceptions rarely, and we would expect APMs considered for such exceptions to demonstrate that a sufficient number of APM Entities are likely to incur losses in excess of the higher MLR. In other words, the potential for financial losses based on statistically significant expenditures in excess of the benchmark must remain meaningful for participants.

To determine whether an APM satisfies the total risk portion of the nominal amount standard, we would identify the maximum potential loss an APM Entity could be required to incur as a percentage of expected expenditures under the APM. If that percentage exceeded the required total risk percentage, then the APM would satisfy the total risk portion of the nominal amount standard.

In evaluating both the total and marginal risk portions of the nominal amount standard, we would not include any payments the APM Entity or its eligible clinicians would make to us under the APM if actual expenditures exactly matched expected expenditures. In other words, payments made to us outside the risk arrangement related to expenditures would not count toward the nominal amount standard. This requirement ensures that perfunctory or pre-determined payments do not supersede incentives for improving efficiency. For example, an APM that simply requires an APM Entity to make a payment equal to 5 percent of the APM benchmark at the end of the year, regardless of actual expenditure performance, would not satisfy the nominal amount standard.

In particular, the financial risk an Advanced APM Entity would bear under an Advanced APM need not take a shared savings structure in which the financial risk increases smoothly

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

based on the amount by which an Advanced APM Entity's actual expenditures exceed expected expenditures. Examples of a risk arrangement based on shared savings are Tracks 2 and 3 of the Shared Savings Program, where the greater the losses in relation to the expenditure benchmark, the greater the potential amount of shared losses an ACO would be required to repay us. On the other hand, an Advanced APM could require APM Entities to pay a penalty based on expenditure targets, regardless of the degree to which the APM Entity actually exceeded those expenditure targets, provided that the payments are otherwise structured in a way that satisfies both the marginal and total risk requirements under the nominal amount standard.

We solicited comment on appropriate levels for the allowable minimum loss rate and the parameters we should consider when determining whether a risk arrangement should warrant an exception from the minimum loss rate portion of the nominal amount standard.

We solicited comment on the Advanced APM nominal amount standard. In particular, we solicited comment on whether the Advanced APM benchmark or the Advanced APM Entity revenue is a more appropriate basis for assessing total risk and on the proposed amounts of total potential risk, marginal risk, and maximum allowable minimum loss rate. In particular, we solicited comment on whether 30 percent is a sufficient level of marginal risk to be considered "more than nominal." We also solicited comment on whether there could be a meaningful standard that we could adopt that only includes total and marginal risk without the minimum loss rate component. Finally, we solicited comment on a tiered nominal risk structure in which different levels of marginal risk could be paired with different levels of total risk.

In commenting on possible alternatives, we encouraged commenters to refer to the policy principles articulated in section II.F.1. of this final rule with comment period and to consider the extent to which their proposed alternatives would be more or less consistent with those principles.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The following is a summary of the comments we received regarding our proposal to set the generally applicable nominal amount standard such that, to be an Advanced APM, an APM must have total risk of at least 4 percent of expected expenditures, marginal risk of at least 30 percent, and, if applicable, a minimum loss rate (MLR) of no more than 4 percent, for which we would also have a process to determine whether a higher MLR is appropriate for particular APMs.

Comment: The comments on the nominal amount standard split into three main themes—complexity, magnitude of risk, and basis of the percentage of risk—but all three elements are closely related. Most commenters expressed their belief that the generally applicable nominal amount standard is excessively complex and should be simplified. In particular, several commenters thought the inclusion of marginal risk and minimum loss ratio components to be especially complicated.

Many commenters also believe that the proposed standard's amount of risk was too high because 4 percent of total cost of care could equate to upwards of 20 percent of an entity's revenue depending on the composition of the APM Entity, and discourages all but the most highly-resourced organizations from Advanced APM participation. Some commenters suggested starting at a lower amount of total risk and increasing over time. Many commenters believe that between 1 and 3 percent of Parts A and B revenue would be a reasonable definition of "more than nominal," particularly in light of not including up-front or investment costs in the determination. Some commenters recommended tailoring risk standards based on various factors or adjusting marginal risk and total risk in relation to one another to the degree that marginal risk could be paired with lower total risk. One commenter stated that level of risk is too high because clinicians would not have access to information on the expenditures outside an APM Entity until the end of a given year. One commenter was concerned that the nominal amount standard would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

be burdensome for rural practices and potentially reduce access to care in rural settings. Some commenters requested that CMS make the generally applicable nominal risk definition more like that proposed for medical homes.

Finally, many commenters stressed that basing the nominal amount standard on APM Entity revenue, rather than expected expenditures as proposed, would be a more meaningful standard that allows for tailoring risk to the size of APM Entities. Several commenters suggested values of between 2 and 15 percent of eligible clinician or APM Entity revenue would be an appropriate standard. Some commenters noted that this would also make the standard more comparable to MIPS.

Response: We appreciate the response to this proposed policy. With respect to the marginal risk and MLR portions of the standard, we understand commenters' concerns that, despite being technically robust, these aspects of the standard are complex enough to require additional time to understand. For that reason, we are not finalizing the marginal risk and MLR requirements as proposed for year 1. We also believe that marginal risk and MLR components are not necessary to explicitly include in the nominal amount standard because we are committed to creating Advanced APMs with strong financial risk designs that incorporate risk adjustment, benchmark methodologies, sufficient stop-loss amounts, and sufficient marginal risk; and that all APMs involving financial risk that we operate now or in the future will meet or exceed the proposed marginal risk and MLR requirements. In section II.F.7.b.(6) of this final rule with comment, we are finalizing these marginal risk and MLR requirements with respect to Other Payer Advanced APMs for QP Performance Period in 2019 and later, as we believe such requirements are important to preventing possible engineering of the nominal amount standard for payment arrangements designed by other payers via manipulation of marginal risk, MLRs, or attribution methodologies in order to make the possibility of reaching a stop-loss cap very

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

unlikely. We believe that this additional time will help mitigate commenters' concerns about complexity.

Regarding the total risk portion of the proposed standard, we agree with commenters that the meaning of "nominal" can be relative and that for many APM Entities, 4 percent of a total cost of care benchmark could represent a significant fraction of an APM Entity's revenue. We believe such amounts of risk would be more than nominal for all APM Entities, but much more substantial for some APM Entities. We recognize that a revenue-based standard would provide an alternative approach under the nominal amount standard that would be particularly meaningful to practices of certain sizes. However, we caution that a revenue-based standard is not easily applied to most current APMs, which tend to base risk arrangements on expenditure benchmarks that are unrelated to a particular APM Entity's revenue. We believe that total cost of care benchmarks are optimal for many APMs, and those will continue to represent the preferred standard for assessing performance in terms of cost. We also caution that, under a revenue-based standard, certain types of APM Entities may have a significant probability of incurring losses outside the stop loss and thus bear no responsibility for increases in expected expenditures beyond that point, which may undermine the ability of such APMs to drive performance for those APM Entities. In seeking a risk standard that is meaningful but not excessive, we sought to balance these considerations.

In deciding on the policy that we finalize below, we considered several alternatives. For instance, we considered setting the revenue-based standard at up to 15 percent of revenue or setting the revenue-based standard at 10 percent so long as risk is at least equal to 1.5 percent of expected expenditures for which an APM Entity is responsible under an APM. While we are finalizing lower revenue-based standards for the first two QP Performance Periods in 2017 and 2018, we intend to increase the standard to one of the alternatives discussed above for the QP

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Performance Period in 2019 and later years. We will weigh public comments on this final rule with comment period and assess the impact of this standard, particularly on the design of Other Payer Advanced APMs by non-Medicare payers, in establishing the nominal amount standard for the QP Performance Period in 2019 and later. We particularly seek comments on a standard that tailors the level of risk to particular APM Entities' circumstances while also ensuring that APMs include strong incentives to improve performance and coordinate care across clinician types. In addition, we will consider the amount of risk taken in APM contracts (with Medicare and other payers) and seek comment on trends in those amounts and other factors that may inform the nominal risk standard for 2019.

Finally, although we are finalizing a policy that is responsive to these comments in that we are not finalizing marginal risk components and we are generally reducing the requisite total risk for an APM to be an Advanced APM, we encourage commenters and other stakeholders to understand that, based on our preliminary analysis, all APMs that could be Advanced APMs for 2017 would have higher levels of risk than would be required under the proposed or the finalized standard. We also point out that reducing the standard for what constitutes a more than nominal amount of risk for losses for purposes of deciding whether an APM is an Advanced APM would not reduce the level of risk under any particular APM, nor is it likely to change the list of Advanced APMs in 2017. Rather, it opens the opportunity for future APMs to be considered Advanced APMs with lower levels of risk than those currently identified as potential Advanced APMs. However, as discussed above, we intend that such future APMs will meet the proposed marginal risk and minimum loss rate standards.

Comment: Some commenters supported the proposed nominal amount standard but also suggested that we develop a more thorough strategy for helping practices develop the tools and capacity to manage risk and move into higher levels of risk over time. One commenter requested

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clarification as to when the nominal risk definition applies.

Response: We appreciate these comments and agree that in addition to offering more Advanced APM opportunities, we also need to guide clinicians in being successful in APMs and Advanced APMs. We refer commenters to the discussion of technical assistance for APM adoption in section II.F.2. of this final rule with comment period. Regarding timing, we will publish a list of APMs that meet the finalized Advanced APM standards, as described in section II.F.4.a. of this final rule with comment. To be clear, the nominal amount standard we are finalizing in this final rule with comment period is the standard we will use in determining whether an APM is an Advanced APM. The actual risk participants bear is defined through the APM itself according to the APM's unique terms and timeframe.

Comment: Some commenters asked whether or not PPS and bundled payments were considered in calculating risk.

Response: To determine the amount of risk borne by an APM Entity in an APM, we will look at the specific risk arrangement under the APM, which may include bundled payments that are prospective or retrospective in nature, but would not include regular methods of Medicare payments for services. We will only assess financial risk that is under the APM; in other words, only risk arrangements that are part of the terms and conditions of the APM itself, not the underlying payment system or systems that the APM may modify. As expressed in the proposed rule and the finalized policy, we will assess total potential losses in relation to the target price for episode payment models.

Comment: Some commenters requested clarification of what we meant in the proposed rule by stating that any payments made by an APM Entity to CMS outside the risk arrangement would not be counted toward the nominal amount consideration.

Response: Payments made "outside" of a risk arrangement mean that the payments are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

not related to cost performance under the terms of the APM. For instance, an APM Entity could be required to pay CMS a flat fee of \$1,000 or take a 1 percent discount on payments. No matter how well the APM Entity performs, those amounts are fixed under the APM. It is those types of payments that would not be considered at risk but rather a cost of APM participation.

We are finalizing two ways that an APM can meet the Advanced APM nominal amount standard. An APM would meet the nominal amount standard if, under the terms of the APM, the total annual amount that an APM Entity potentially owes us or foregoes is equal to at least: (1) for QP Performance Periods in 2017 and 2018, 8 percent of the average estimated total Medicare Parts A and B revenues of participating APM Entities (the “revenue-based standard”); or (2) for all QP Performance Periods, 3 percent of the expected expenditures for which an APM Entity is responsible under the APM (the “benchmark-based standard”). For episode payment models, expected expenditures means the target price for an episode. We note that we are only finalizing the amount of the revenue-based nominal amount standard for the first two QP Performance Periods at this time. However, we intend to increase the revenue-based nominal amount standard for the third and subsequent QP Performance Periods. We seek comment on the amount and structure of the revenue-based nominal amount standard for QP Performance Periods in 2019 and later. Specifically, we seek comment on: (1) setting the revenue-based standard for 2019 and later at up to 15 percent of revenue; or (2) setting the revenue-based standard at 10 percent so long as risk is at least equal to 1.5 percent of expected expenditures for which an APM Entity is responsible under an APM.

The standard we are finalizing for the 2017 and 2018 QP Performance Periods is a change from the proposed nominal amount standard. Under this final standard, we would not assess marginal risk or MLRs. Additionally, instead of replacing the proposed benchmark-based total risk standard with the revenue-based standard, we are adopting the revenue-based standard

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

as an additional option. Therefore, if an APM's financial design meets either of the two nominal amount standards, we would consider the nominal amount standard to be met. This makes the finalized standard more accommodating of the increasing variety of financial designs in APMs. For instance, current APMs that have total cost of care benchmarks, such as the Next Generation ACO Model, would be easily assessed as to whether they meet the benchmark-based standard because the standard and the APM design use the same metric. Other potential APM designs might be more easily assessed under the revenue-based standard. The nominal amount standard we are finalizing for the 2017 and 2018 QP Performance Periods further increases flexibility because, in the event that an APM using a total cost of care benchmark does not meet the benchmark-based standard, we would still assess it under the revenue-based standard by calculating the total potential risk as a percentage of the average estimated Medicare Parts A and B revenue of the participating APM Entities.

Although we are finalizing a standard based in part on revenue, for episode payment models we believe the standard based on the target price is most relevant, as target price is the focal point for risk under such APMs. Using a revenue-based standard for episode payment models would likely disqualify most potential episode payment models from becoming Advanced APMs because their relatively narrow scope makes the amount at risk a smaller percentage of APM Entity revenue when compared to APMs like ACO initiatives.

As discussed above, our intention in setting a revenue-based nominal amount standard is to tailor the level of risk an APM Entity must bear relative to the resources available to it. In instances where an APM Entity is one component of a larger health care provider organization, we believe that the revenue of the larger organization is a more accurate measure of the resources available to the APM Entity and should be the basis for setting the revenue-based nominal amount standard, even if only a portion of the organization is participating in the APM Entity.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

However, we believe that it will not be operationally feasible to apply the nominal amount standard in this fashion during the first two QP Performance Periods, so this final rule sets the revenue-based nominal amount standard based solely on the revenue of the APM Entity. Nevertheless, ideally, the nominal amount standard would take into consideration the resources available to an APM Entity using a measure such as revenue for the parent organization. We are evaluating the feasibility of implementing such a measure in lieu of APM Entity revenue for the third year of the program and later years. Under such an approach, we would anticipate basing the revenue-based nominal amount standard on the total Medicare Parts A and B revenues across the APM Entity, any parent organizations, any subsidiary organizations, and any subsidiaries of parent organizations for all eligible clinicians and groups who are participants of an APM Entity. We seek comment on this approach and how such an approach could be implemented while minimizing burden on participants.

(b) Medical Home Model Standard

We proposed that for Medical Home Models, the total annual amount that an Advanced APM Entity potentially owes us or foregoes under the Medical Home Model must be at least the following amounts in a given performance year:

- In 2017, 2.5 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2018, 3 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2019, 4 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2020 and later, 5 percent of the APM Entity's total Medicare Parts A and B

revenue.

We believe the statute's explicit discussion of medical homes gives us unique latitude to separately set financial risk and nominal amount standards for Medical Home Models that fall below an amount we consider sufficient to be "more than nominal" in the context of other types

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of APMs. We also believe that the meaning of the term “nominal” depends on the situation in which it is applied, so we believe it is appropriate to consider the characteristics of the APM Entities in Medical Home Models in setting the nominal amount standard for Medical Home Models. As we noted in discussing the financial risk standard, few APM Entities in Medical Home Models have had experience with financial risk, and many would be financially unable to provide sufficient care or even remain a viable business in the event of substantial disruptions in revenue. As such, we believe we should base the nominal amount standard on the APM Entity’s total Medicare Parts A and B revenues and also avoid a potentially excessive level of risk for such entities. Our proposal set forth a gradually increasing but achievable long-term amount of risk that would apply in subsequent years. In general, we believe that this scheme allows Medical Home Models to craft incentive designs that allow participants in Medical Home Models to succeed through care transformation and the provision of high-value care while not threatening the ability of small practices to function.

Even more than for participants in non-Medical Home Models, basing the Medical Home Model nominal amount standard on percentage of risk in relation to a total cost of care benchmark would mean that participants would be required to bear greater total risk in relation to their revenues than other entities, which we believe would be undesirable in light of the special characteristics of Medical Home Models.

For the Medical Home Model nominal amount standard, we solicited additional comment on the length of the proposed multi-year “ramp up period” and the magnitude of the total risk amounts during such a period. We also solicited comment on the potential addition of a marginal risk amount to the extent applicable and on whether the Advanced APM benchmark or Advanced APM Entity revenue is the most appropriate standard for measuring total risk.

In commenting on possible alternatives, we encouraged commenters to refer to the policy

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

principles articulated in section II.F.1. of this final rule with comment period and to consider the extent to which their proposed alternatives would be more or less consistent with those principles.

The following is a summary of the comments we received regarding our proposal for the Advanced APM nominal amount standard for Medical Home Models.

Comment: Several commenters stated that 2.5 percent of Medicare Parts A and B revenue is an appropriate standard for the minimum total risk a Medical Home Model must require to be an Advanced APM and believe that we should not increase that requirement to 5 percent over time. Some commenters note that such a quick increase, set prospectively, is unwise because there is little experience with risk in the Medical Home Model context for all stakeholders involved. Some commenters expressed concern that this standard is too limiting in that too few clinicians will have access to an Advanced APM in 2017 or 2018.

Response: We understand commenters' concerns that a programmed increase from 2.5 percent to 5 percent of revenue over several years is too great in magnitude and premature. However, we believe that an ultimate Medical Home Model nominal amount standard of 5 percent is appropriate, and that setting the standard at 5 percent of Parts A and B revenue strikes the appropriate balance to reflect the meaning of "nominal" in the Medical Home Model context. We do not believe the proposed increase in risk over time would be unmanageable. Instead, we consider the incremental increases in the standard over several years from 2.5 percent to 5 percent to be a recognition that the earliest adopters of risk in the Medical Home Model context might initially consider any losses to be substantial while acclimating to bearing risk, but with successive years of experience, gain comfort and confidence in assuming higher risk levels.

We also reiterate, as we note for the generally applicable nominal amount standard, that the terms and conditions in the particular APM govern the actual risk that participants

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

experience; the nominal amount standard we are setting in this final rule with comment period merely sets a floor on the level of risk required to be an Advanced APM. Therefore, we do not believe that this nominal amount standard for Medical Home Models will in itself limit Advanced APM participation opportunities. Rather, we believe that developing more APMs, amending existing APMs, expanding successful APMs, and reopening applications for certain APMs could result in increased opportunities to participate in Advanced APMs in the near future.

We are finalizing the Medical Home Model nominal amount standard as proposed.

To be an Advanced APM, a Medical Home Model must require that the total annual amount that an Advanced APM Entity potentially owes us or foregoes under the Medical Home Model be at least the following amounts in a given performance year:

- In 2017, 2.5 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2018, 3 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2019, 4 percent of the APM Entity's total Medicare Parts A and B revenue.
- In 2020 and later, 5 percent of the APM Entity's total Medicare Parts A and B revenue.

Also, parallel with the generally applicable nominal amount standard, if the financial risk arrangement under the Medical Home Model is not based on revenue (for example, it is based on total cost of care or a per beneficiary per month dollar amount), we will make a determination for the APM based on the risk under the Medical Home Model compared to the average estimated Parts A and B revenue of its participating APM Entities using the most recently available data.

We believe that, given the unique financial risk and nominal amount standards we proposed for Medical Home Models, it would be appropriate to impose size and composition limits for the Medical Home Models to which the unique standards would apply to ensure that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the focus is on organizations with a limited capacity for bearing the same magnitude of financial risk as larger APM Entities do. We proposed that, beginning in the second QP Performance Period (proposed to be 2018), the Medical Home Model financial risk standard and nominal amount standard, described in section II.F.4.b.(4) of this final rule with comment period, would only apply to APM Entities that participate in Medical Home Models and that have 50 or fewer eligible clinicians in the organization through which the APM Entity is owned and operated. Thus, in a Medical Home Model that meets the criteria to be an Advanced APM, the proposed Medical Home Model financial risk and nominal amount standards would only apply to those APM Entities owned and operated by organizations with 50 or fewer eligible clinicians. We believe it is appropriate to use the number of eligible clinicians as the basis, rather than physicians, for this threshold because the number of eligible clinicians reflects organizational resources and capacity, and also may fluctuate widely around a specific number of physicians. We also believe that the size threshold of 50 eligible clinicians is appropriate because organizations of that size have demonstrated the capacity and interest in taking on higher levels of two-sided risk either by themselves or by joining with other organizations. In the event that a Medical Home Model happens to meet the generally applicable financial risk and nominal amount standards, this organizational size limitation would not be applicable. We proposed the same restriction on Medicaid Medical Home Models as discussed in section II.F.7 of this final rule with comment period.

Measuring organizational size based on the size of the “parent organization” differs from measuring it based on the size of the APM Entity. Collecting accurate information on the number of eligible clinicians affiliated with a parent organization would require additional, but we believe achievable, reporting by APM Entities. We believe that size of the organization is generally a better indication of risk-bearing capacity than APM Entity size. For instance, an

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM Entity may be very small if it represents one practice site, but that practice site may be one of many affiliated with a health system or independent physician association of substantial size.

We believe that the proposed limits on the types and sizes of entities that can be Advanced APM Entities under Medical Home Models would encourage larger organizations to move into Advanced APMs with greater levels of risk than the smaller levels that could enable Medical Home Models to become Advanced APMs. This is consistent with our goals that the incentives for Advanced APM participation should reward commitment to challenging models. However, we do not intend to imply that participation in Medical Home Models is necessarily inappropriate for larger organizations. We recognize that Medical Home Models differ from other APMs, such as ACO initiatives, because Medical Home Models focus on improving primary care through much more targeted and intensive interventions than those commonly found in other APMs. We hope to encourage participation in Medical Home Models for all organizations that can derive value from their designs, not just those that are too small to join ACO initiatives and other higher risk APMs.

We proposed to implement this size limitation for Advanced APMs that are Medical Home Models beginning in the second year of the Quality Payment Program (2018 QP Performance Period) because we understand that applications for many APMs would be due to us prior to this final rule, precluding APM Entities from having time to substantially adjust their APM participation strategies for the 2017 QP Performance Period. We proposed that we would make a determination of whether an APM Entity meets the size limitation prospectively before a QP Performance Period, and that the determinations would not subsequently change based on changes in organizational size during or after the QP Performance Period (although changes in organizational size would, as applicable, affect determinations for subsequent QP Performance Periods).

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We solicited comment on this proposal, particularly with regard to the use of the count of eligible clinicians in the parent organization of the APM Entity as the metric of organizational size for Medical Home Models, and whether setting the limit at 50 for the number of eligible clinicians in the organization would constitute a reasonable threshold to distinguish between organizations that we could expect to have the financial capability to join APMs, such as ACO initiatives, that have two-sided risk. We also solicited comment on an alternative option to establish the size limitation based on the number of eligible clinicians in the entire Medical Home Model, rather than on number of eligible clinicians in a particular APM Entity's organization.

The following is a summary of the comments we received regarding our proposal to, starting in the second QP Performance Period, restrict the Medical Home Model financial risk and nominal amount standards applicable only to APM Entities with 50 or fewer eligible clinicians in their parent organizations. Comments regarding our proposal to apply the same restriction on Medicaid Medical Home Models are also included.

Comment: Many commenters expressed opposition to this policy. Commenters cited deterrence of participation by larger organizations in Medical Home Models that are Advanced APMs because of the inability to earn the APM Incentive Payment, difficulties in creating attractive multispecialty Medical Home Models, and disadvantages for large organizations competing for eligible clinicians. They believe that the APM Incentive Payment is a strong incentive, and that the presence or absence of the opportunity to earn it will be a driving factor in eligible clinician and APM Entity decision-making.

Some commenters believe that our proposed size criterion of 50 eligible clinicians in the organization is an arbitrary cutoff that does not accurately represent a distinction between organizations that can and cannot reasonably assume downside risk, and some asked for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clarification for why the cutoff was set at 50. Some suggested that if we do not eliminate the size limit, we should increase it to 100 or 200 clinicians. Other clinicians suggested that the limit be applied to APM Entities rather than parent organizations.

Response: We appreciate the many comments on this topic, and understand that the organization size limit creates an additional consideration for entities looking to participate in an Advanced APM. In many ways, it is consistent with our goal that entities move toward robust, performance-based APMs. Creating a unique Medical Home Model financial risk criterion reflects what we believe is a reasonable goal for smaller entities' risk-bearing capacity. We also believe that organization size is a meaningful proxy for potential risk-bearing capacity. In arriving at the magnitude of the limit, we compared the sizes of Shared Savings Program ACOs across tracks of the program to the organizational sizes of CPC practices and found that the vast majority of CPC practices fell below this number and the vast majority of ACOs were above this number. We believe that this supports using eligible clinician counts as a proxy for risk-bearing capacity and for selecting 50 as the cutoff that differentiates between use of the Medical Home Model or the generally applicable financial risk criterion. Therefore, we believe that our proposed policy is sound, especially because there is no limit in the first year, and organizations will have the time to consider their options accordingly.

We also believe that a Medical Home Model such as CPC+ offers many inherent benefits to its participants regardless of the opportunity to earn the APM Incentive Payment. The 5 percent APM Incentive Payment will be one benefit to certain Advanced APM participants, but the opportunities within APMs themselves should be the primary drivers of participation decisions because those risks and rewards within the APMs can outweigh the 5 percent APM Incentive Payment. Therefore, we encourage organizations with both greater and fewer than 50 clinicians to consider the ability of Medical Home Models such as CPC+ to help develop care

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

infrastructure and transform practices to be more patient-centered and value-oriented.

Comment: Some commenters suggested that instead of using the number of eligible clinicians we use clinician revenue or the size of the APM Entity's patient panel or attributed beneficiary list in order to draw a distinction between organizations' risk-bearing capacity.

Response: We appreciate the idea of using alternative methods of setting the size limit for a Medical Home Model Advanced APM such as patient panel size or revenue. Attribution and revenue have much greater variability across APM Entities than number of eligible clinicians, which would make the setting of a meaningful number more challenging. Further, for any APM Entity, attribution numbers can vary significantly from year to year, partly in relation to the number of eligible clinicians, but also due in part to uncontrollable factors such as beneficiary behavior and the presence of multiple APM Entities in the same region that vie for the attribution of a similar pool of beneficiaries. Finally, several APMs require that an APM Entity have a minimum number of attributed beneficiaries in order to be eligible to participate. We have data on APM Entity attribution numbers, but because we are pursuing an appropriate proxy for the risk-bearing capacity of a parent organization, we do not believe that we could accurately obtain patient panel data for entire organizations without imposing a substantial administrative burden of such organizations. Therefore, we continue to believe that the best metric available to us at this time is the number of eligible clinicians in the organization.

Comment: Some commenters expressed concern that the Medical Home Models that are Advanced APMs offer an incentive for clinicians to enter Advanced APMs with lower levels of risk than they would otherwise bear. A commenter stated that this could cause the Advanced APMs to compete with one another, and that the lowest risk option that is an Advanced APM will be the most attractive to many clinicians.

Response: The concern expressed by these commenters is what led us to propose this

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

policy. We believe that organizations capable of taking on significant downside risk should have the incentives align to encourage them to assume the amount of risk that matches their capabilities. However, for many smaller organizations, a high degree of risk such as that required in the ACO initiatives is not a viable option. We believe participation in a Medical Home Model such as CPC+ represents the most risk some smaller organizations can handle at this time, and such APMs offer invaluable support for transforming practices to achieve our delivery system reform goals. That is, the balance we try to strike in this policy is to provide incentives for participation in Advanced APMs but also encouragement for each APM Entity to participate in the best “fit” APM for them.

We are finalizing as proposed the limitation on applicability of the Medical Home Model financial risk and nominal amount standard to APM Entities with fewer than 50 eligible clinicians in their parent organizations. This limitation would not apply to the first QP Performance Period that begins in 2017. Therefore, any APM Entity participating in a Medical Home Model that meets the unique Medical Home Model Advanced APM standards will be considered to be participating in an Advanced APM and have the opportunity to become a QP for purposes of payment year 2019. Starting in the QP Performance Period that begins in 2018, the Medical Home Model Advanced APM financial risk standard would not apply for APM Entities that are owned and operated by organizations with greater than 50 eligible clinicians. As such, participation in a Medical Home Model Advanced APM by such an Advanced APM Entity would not offer the opportunity to attain QP status through that Medical Home Model unless the Medical Home Model meets the generally applicable Advanced APM financial risk criterion. Beginning for the QP Performance Period starting in 2018, we will make this size limit determination for APM Entities in relevant Medical Home Models prior to a QP Performance Period using the most recently available information from the year prior to the QP Performance

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Period. Therefore, the first determinations of organization size will take place in 2017 using information gathered in 2017. We intend to collect the necessary information through the Medical Home Model operations and will issue guidance on how and when we will do so.

#### (5) Capitation

We proposed that full capitation risk arrangements would meet the Advanced APM financial risk criterion. We proposed that, for purposes of this rulemaking, a capitation risk arrangement means a payment arrangement in which a per capita or otherwise predetermined payment is made to an APM Entity for all items and services furnished to a population of beneficiaries, and no settlement is performed for the purpose of reconciling or sharing losses incurred or savings earned by the APM Entity. We also reiterated that Medicare Advantage and other private plans paid to act as insurers on the Medicare program's behalf are not Advanced APMs.

We believe that capitation risk arrangements, as defined here, involve full risk for the population of beneficiaries covered by the arrangement, recognizing that it might require no services whatsoever or could require exponentially more services than were expected in calculating the capitation rate. The APM Entity bears the full downside and upside risk in this regard. Thus, we believe capitation arrangements inherently require an APM Entity to bear financial risk for monetary losses in excess of a nominal amount. We proposed that, where payment is made to participating entities in an APM using a capitation risk arrangement, the APM and participating entities would meet the criterion under section 1833(z)(3)(D)(ii)(I) of the Act.

In implementing this proposed policy, it is important to distinguish capitation as a risk arrangement from capitation as only a cash flow mechanism. A capitation risk arrangement adheres to the idea of a global budget for all items and services to a population of beneficiaries

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

during a fixed period of time. Cash flow mechanisms that make payments in predetermined amounts that are later reconciled or adjusted based on actual services are not necessarily a full risk arrangement. For example, an APM Entity has a capitation arrangement under an APM that pays \$1,000 per beneficiary per month for a population of 100 beneficiaries, totaling \$1.2 million per year. If expenditures for services actually furnished to these beneficiaries would have totaled \$1.3 million if paid on a FFS basis, a payment mechanism without risk might make a reconciliation payment of \$100,000 to the entity. In that case, the APM Entity is not bearing any financial risk for monetary losses under the APM. If there is partial reconciliation, the arrangement would not meet the proposed capitation risk arrangement definition but still may meet the financial risk and nominal amount standards through the assessments described in this section above. In contrast, if this arrangement is a capitation risk arrangement, there would be zero reconciliation for those losses. Under our proposal, we would categorically accept that a capitation risk arrangement under an APM would meet the Advanced APM financial risk criterion.

We solicited comment on our proposal for the categorical acceptance of capitation risk arrangements as satisfying the Advanced APM financial risk criterion and on our proposed definition of a capitation risk arrangement. We also solicited comment on other types of arrangements that may be suitable for such treatment for purposes of this financial risk criterion. Finally, we solicited comment on potential limits or qualifications to the capitation standard to prevent potential abuse or incentives that are not consistent with the provision of high value care.

The following is a summary of the comments we received regarding our proposal to consider full capitation risk arrangements to meet the Advanced APM financial risk criterion.

Comment: Several commenters expressed support for considering full capitation payment arrangements to meet the Advanced APM financial risk criterion. Some commenters requested

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that we further clarify what we would consider full capitation and how we would treat partial capitation arrangements. In particular, we received suggestions that full capitation be in reference to all “agreed upon items and services” rather than “all items and services.” Finally, some commenters requested that we not limit this policy to arrangements without reconciliation for savings or losses. One commenter cautioned that an over-abundance of capitation arrangements in a market could fuel consolidation and restrict the diversity of practice types and sizes, and one commenter wanted assurance that capitation would be accompanied by appropriate quality measurement to mitigate a focus only on cost.

Response: We appreciate the general support for this policy. With respect to defining full capitation, we believe that the structure as proposed is neither too broad nor too narrow. In our preamble language, we described full capitation as a “global budget for all items and services to a population of beneficiaries during a fixed period of time.” We believe that that is a key distinction between full and partial capitation. An “agreed upon” set of items and services could be relatively small compared to all items and services in the payment arrangement between parties. Therefore, we believe that this standard should only apply to “full” capitation. Similarly, as described in the proposed rule, reconciliation of settlement of savings and losses mitigates and removes the risk aspect of capitation. This is the difference between a risk arrangement, in which there is no reconciliation, and a cash flow mechanism, in which the ultimate payment amount is adjusted after the fact to account for variations in utilization.

For payment arrangements that do not meet this definition of full capitation, we would still assess the arrangement under the applicable financial risk criterion. Therefore, partial capitation arrangements could meet the criterion so long as the magnitude of the payments at risk involved in the arrangement meets the nominal amount standard and the arrangement is actually a risk arrangement rather than a cash flow mechanism.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Finally, we appreciate the commenter's concern that a high prevalence of capitation arrangements without sufficient quality performance requirements could misplace incentives for delivering high value care. We will monitor the impact of Advanced APMs with capitation arrangements in the future, especially as the All-Payer Combination Option becomes available beginning in payment year 2021. We also believe that this concern is mitigated in part by the Advanced APM MIPS-comparable quality measure requirement, described earlier in this section, because Advanced APMs must also base payment at least in part on meaningful quality measures instead of entirely on cost performance.

We are finalizing the policy that full capitation arrangements would meet the Advanced APM financial risk criterion. All other payment arrangements would be assessed against the applicable nominal amount standards set forth in this final rule.

#### (6) Medical Home Expanded Under Section 1115A(c) of the Act

Section 1833(z)(3)(D)(ii)(II) of the Act states that an Advanced APM must either meet the financial risk criterion or be a Medical Home Model expanded under section 1115A(c) of the Act. We refer to the latter criterion as the expanded Medical Home Model criterion. We proposed that a Medical Home Model that has been expanded under section 1115A(c) of the Act would meet the expanded Medical Home Model criterion and thus would not need to meet the Advanced APM financial risk criterion as described above. Under this proposal, an APM would have to both be determined to be a Medical Home Model as defined in this rulemaking and in fact be expanded using the authority under section 1115A(c) of the Act. Such expansion is contingent upon whether, for an APM tested under section 1115A(b) of the Act:

- The Secretary determines that such expansion is expected to reduce spending under the applicable title without reducing the quality of care; or improve the quality of patient care without increasing spending;

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- CMS' Chief Actuary certifies that such expansion would reduce (or would not result in any increase in) net program spending under the applicable titles; and

- The Secretary determines that such expansion would not deny or limit the coverage or provision of benefits under the applicable title for applicable individuals. In determining which models or demonstration projects to expand under the preceding sentence, the Secretary shall focus on models and demonstration projects that improve the quality of patient care and reduce spending.

We note that the expanded Medical Home Model criterion cannot be met unless a Medical Home Model has been expanded under section 1115A(c). Merely satisfying expansion criteria would not be sufficient to meet this Advanced APM criterion. This expanded Medical Home Model criterion is directly related to a similar criterion addressed in the proposed rule for Medicaid Medical Home Models, which addresses how such APMs can meet the Other Payer Advanced APM financial risk criterion by having criteria comparable to an expanded Medical Home Model. We requested comments on the proposed requirements for this and all proposed Advanced APM criteria.

The following is a summary of the comments we received regarding our proposal that Medical Home Models that are expanded under section 1115A(c) of the Act would meet the Advanced APM financial risk criterion.

Comment: Several commenters urged us to assess the Comprehensive Primary Care (CPC) initiative in order to expand it under section 1115A(c) authority as soon as possible. Some commenters also stated that this criterion was very narrow and limits the future Medical Home Model opportunities for Advanced APM participation. Some commenters believe that this is not aligned with Congressional intent to enable Medical Home Models to become Advanced APMs without meeting the financial risk criteria.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: Expansion of the CPC initiative is outside the scope of this final rule with comment period. We will continue to consider whether CPC meets the statutory expansion criteria. As with CPC, we will closely monitor the results of CPC+ in order to determine whether it meets the statutory criteria for expansion in the future.

With respect to the narrowness of this policy, we believe that we do not have the statutory authority to broaden the standard to include Medical Home Models that have not actually been expanded. Section 1833(z)(3)(D)(ii)(II) of the Act is quite clear in its reference to expansion under section 1115A(c) of the Act.

We are finalizing the expanded Medical Home Model policy as proposed. An APM that is determined to be a Medical Home Model and has in fact been expanded using the authority under section 1115A(c) of the Act meets the Advanced APM financial risk criterion.

#### (7) Application of criteria to current and recently announced APMs

In the proposed rule, we used the proposed Advanced APM criteria to identify the current APMs that we anticipate would be Advanced APMs for the first QP Performance Period.

The list of proposed Advanced APMs was based on the application of criteria in the proposed rule and did not preclude any changes to the list based on: (1) any changes made to the proposed criteria or their application in this final rule; (2) any modifications to the design of current APMs; or (3) any new APMs announced after publication of the proposed rule.

Consistent with our finalized policy to post an official determination of which APMs would meet the final Advanced APM criteria prior to the beginning of the first QP Performance Period, we will publish such materials on the CMS website following the publication of this final rule with comment period.

The following is a summary of the comments we received on the preliminary assessment of which current APMs meet the Advanced APM criteria.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: Many commenters responded to the publication of the preliminary list of Advanced APMs by suggesting additional candidates to be Advanced APMs. Several commenters supported the indication that certain APMs, such as Shared Savings Program Tracks 2 and 3, the Oncology Care Model, and the Next Generation ACO Model, would be Advanced APMs based on the proposed criteria. Other commenters stated their belief that the Shared Savings Program Track 1, BPCI, and the proposed Part B Drug Payment Model should be Advanced APMs as well. Some commenters suggested that the current Maryland All-Payer Model should be classified as an Advanced APM, and that participating Maryland hospitals and hospital-based clinicians should be considered Advanced APM Entities because they will be primarily responsible for the cost and quality of care provided to beneficiaries. Commenters cited that participants in such APMs currently represent some of the most innovative and dedicated organizations interested in driving delivery system reform goals. Other commenters generally stated that the current list of Advanced APMs is quite limited and that there should be more Advanced APMs, specifically for hospitals and specialties.

Response: We thank the commenters for their thoughts on which APMs should or should not be Advanced APMs. We are finalizing criteria and discuss the rationale for such decisions earlier in this section, and we highlighted the many ways in which we are planning to expand the opportunities for Advanced APM participation. For instance, concurrent with the release of this rule, we explain our strategy to: (1) reopen certain APMs for additional application rounds; (2) amend the design of certain APMs so that they meet the Advanced APM criteria; (3) and engage in development of new APMs that could be Advanced APMs, potentially including APMs based on recommendations from the PTAC. Finally, we encourage the commenters to examine the final Advanced APM determinations for 2017 that we will publish no later than January 1, 2017. These determinations will identify which Advanced APM criteria each APM meets or does not

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

meet.

Comment: Some commenters responded to the proposed list of APMs by submitting ideas for the design of new APMs.

Response: We thank the commenters for providing input on the design of potential future APMs. We note that soliciting comment on the design of potential future APMs is outside of the scope of this final rule with comment period. However, we remind commenters of the PTAC, as described in section II.F.10. of this final rule with comment period, and note that commenters can submit proposals for the design of new APMs directly to the Innovation Center.

Comment: Some commenters urged CMS to identify a Medical Home Model that would be an Advanced APM and stated their belief that it was Congress' intent to have a Medical Home Model that is an Advanced APM.

Response: We thank the commenters for emphasizing the importance of making Medical Home Models available as Advanced APMs. As stated in section II.F.4.6. of this final rule with comment period, the unique statutory path specified for Medical Home Models to become Advanced APMs explicitly requires expansion under section 1115A(c) of the Act, which is something that has not yet occurred for any Medical Home Model. In the absence of a Medical Home Model that has been expanded under section 1115A(c) of the Act, the Medical Home Model financial risk criterion could allow a Medical Home Model to be an Advanced APM without meeting the expansion pathway set forth in the law.

In the proposed rule, we noted that the CJR model did not meet the proposed Advanced APM criteria. We solicited comment on how we might change the design of CJR through future rulemaking to make it an Advanced APM, and we solicited comment on how to include eligible clinicians in CJR for purposes of the QP determination as described in section II.F.5. of this final rule with comment period.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The following is a summary of the comments we received regarding our request for comments on how to redesign the CJR model to make it an Advanced APM.

Comment: Many commenters urged CMS to modify existing programs, such as the CJR model, Track 1 of the Shared Savings Program, and BPCI, to make them meet the criteria for Advanced APMs and to create an Advanced APM “on-ramp” for interested participants. Specifically, many commenters recommended that CJR and BPCI be modified to require the use of CEHRT, and that steps be taken to enable BPCI to include quality measures that will satisfy the Advanced APM quality criterion. One commenter expressed the view that CJR currently meets the requirements of an Advanced APM. Commenters recommended rewarding clinicians with improvement activities credit for participating in CJR and BPCI programs that satisfy the Advanced APM criteria. Some commenters suggested that CMS either allow all tracks of the CEC model to be an Advanced APM or to offer an option for non-Large Dialysis Organization (LDO) participations in the CEC model to assume downside risk to be in an Advanced APM. One commenter suggested that CMS consider the Maryland All-Payer Model to be an Advanced APM.

Response: To be considered an Advanced APM, an APM must meet the three criteria described in this section through the terms of its arrangement with APM Entities. It is not sufficient that an APM Entity, independent of an obligation under the APM, meets the standards.

We agree with commenters that one way for CMS to encourage more participation in Advanced APMs is to assess and modify existing APMs to meet the criteria for Advanced APMs. We considered this in developing proposed amendments to CJR (81 FR 50793), and we are considering implementing a new voluntary bundled payment APM for CY 2018 that could meet the Advanced APM criteria.

Comment: One commenter requested that any APM in which CMS takes a direct

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

discount off of FFS payments, such as CJR, regardless of whether or not it meets the Advanced APM criteria outlined in the Proposed Rule, should qualify for the APM Incentive Payment.

Another commenter requested that we deem CJR an Advanced APM regardless of modifications to the model.

Response: We believe we have defined the statutory criteria appropriately, consistent with the terms of the statute. As such, Advanced APMs are limited to those that meet the final criteria.

Comment: A few commenters suggested that CMS make the following changes to CJR: (1) restructure CJR by replacing the hospital as the APM Entity with MIPS eligible clinicians; (2) replace CJR's retrospective reimbursement with a prospective payment; and (3) include outpatient services in CJR. Another commenter recommended that CMS use its own data to determine which CJR hospitals meet the Meaningful Use requirements and relay this information to affiliated clinicians, or, in the alternative, add a measure similar to the Shared Savings Program measure that assesses the use of CEHRT by certain eligible clinicians. Another commenter suggested that CMS ask CJR hospitals to voluntarily provide a list of eligible clinicians who treat patients in the hospital for any of the CJR procedures to satisfy the Advanced APM Participation List requirement. Also, to satisfy the CEHRT requirement, commenter suggested that CMS either use the Advancing Care Information domain data submitted by eligible clinicians in CJR to assess whether the eligible clinicians are meaningful users of CEHRT or count a hospital's participation in the EHR Incentive Program. Another commenter suggested the following changes to CJR: (1) make physician assumption of risk mandatory, rather than place the risk on hospitals; and (2) include medical device manufacturers in the pool of CJR collaborators.

Response: We thank the commenters for their ideas. We considered these comments

## 5. Qualifying APM Participant (QP) and Partial QP Determination

The QP determination process is specified under section 1833(z)(2) of the Act, in which QPs are defined as those eligible clinicians who meet the specified threshold(s).

We proposed a process for determining which eligible clinicians would be QPs or Partial QPs for a given payment year through their participation in Advanced APMs during a corresponding QP Performance Period. Per sections 1833(z)(2) and 1848(q)(1)(C)(ii)(I) and (II) of the Act, an eligible clinician would become a QP or Partial QP for a payment year if they are determined at the end of the performance period to be eligible clinicians in an Advanced APM Entity that collectively meets the threshold values for participation in an Advanced APM during the corresponding QP Performance Period, and starting in 2021, the threshold values for participation in an Other Payer Advanced APM as proposed here. We proposed to determine each year whether an eligible clinician achieved the threshold level of participation to become a QP or Partial QP during the corresponding QP Performance Period. We would make this assessment independent of QP or Partial QP determinations made in previous years and accounting for Advanced APMs that begin or end on timeframes that do not align precisely with the QP Performance Period. The following would apply to an eligible clinician whom CMS determines to be a QP for a particular year:

- For payment years 2019 – 2024, the QP will receive a lump sum payment equal to 5 percent of the estimated aggregate payment amounts for Medicare Part B covered professional services for the prior year, as described in section II.F.8. of this final rule with comment period;
- The QP will be excluded from MIPS payment adjustments, as described in section II.E.3. of this final rule with comment period; and
- For payment years 2026 and later, payment rates under the Medicare PFS for services furnished by the eligible clinician will be updated by the 0.75 percent qualifying APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

conversion factor as specified in sections 1848(d)(1)(A) and (d)(20) of the Act.

Through the APM Entity group determination described in section II.F.5.b. of this final rule with comment period, we would identify eligible clinicians who do not meet the QP Threshold but reach the Partial QP Threshold for a year to be Partial QPs. Partial QPs would not be eligible for the 5 percent APM Incentive Payment for years from 2019 through 2024 or, beginning for 2026, the qualifying APM conversion factor. However, Partial QPs would have an opportunity to decide whether they wish to be subject to a MIPS payment adjustment, which could be positive or negative.

The statute requires that we use two options to determine whether an eligible clinician is a QP or a Partial QP for a payment year—one is the Medicare Option and, beginning in 2021, the other is the All-Payer Combination Option. While these are the terms based on statutory language that we have chosen to use for the purposes of describing the process by which we can calculate an eligible clinician's Threshold Score, we note that the use of the word "option" does not imply that an eligible clinician will have the ability to choose between the two. We further outlined in the proposed rule our proposed process by which we will assess eligible clinicians under both options (beginning in 2021) to the extent that sufficient data is submitted to us.

The Medicare Option focuses on participation in Advanced APMs, and we would make determinations under this option based on Medicare Part B covered professional services attributable to services furnished through an Advanced APM Entity. The Medicare Option is the only option available for QP determinations during the first 2 years of this program (payment years 2019-2020). The All-Payer Combination Option, described in section II.F.7. of this final rule with comment period, is applicable beginning in the third payment year (2021) and would allow us to make determinations based on participation in both Advanced APMs and Other Payer Advanced APMs. The All-Payer Combination Option would not replace or supersede the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medicare Option; instead, it would allow eligible clinicians to become QPs by meeting a relatively lower threshold based on Medicare Part B covered professional services through Advanced APMs and an overall threshold based on services through both Advanced APMs and Other Payer Advanced APMs. With our QP Threshold Score methodologies finalized in this rule, we generally interpret payments “through” an Advanced APM Entity to mean payments made by us for services furnished to attributed beneficiaries, who are the beneficiaries for whose costs and quality of care an Advanced APM Entity is responsible under the Advanced APM. Under section 1848(q)(1)(C)(iii) of the Act, the calculations used for Partial QP determinations are the same, but the threshold percentages to be a Partial QP for each year are lower than those required to be a QP.

The QP and Partial QP Thresholds under the Medicare Option are shown in Tables 32 and 34 of this final rule with comment period. The QP and Partial QP Threshold values under the All-Payer Combination Option are shown in Tables 33 and 35 of this final rule with comment period. We will determine an eligible clinician’s QP status for a payment year by calculating an eligible clinician’s Threshold Score, and comparing the eligible clinician’s Threshold Score (either based on payment amounts or patient counts) to the relevant QP Threshold or Partial QP Threshold. In addition, we discussed our proposal to make QP determinations at a group level based on an entire Advanced APM Entity in section II.F.5.b of the proposed rule (81 FR 28319-28321).

According to section 1833(z)(2)(D) of the Act, the Secretary may base the determination of whether an eligible clinician is a QP or a Partial QP by using counts of patients in lieu of using payment amounts and using the same or similar percentage criteria as those used for the payment amount method, as the Secretary determines is appropriate. For QP and Partial QP determinations using patient count calculations, we proposed to use the percentage values

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

displayed in Tables 34 and 35 of this final rule with comment period. The purpose of the proposed design of the Medicare patient count method is to make QP determinations accessible to entities and individuals who are clearly and significantly engaged in delivering value-based care through participation in Advanced APMs.

By performing preliminary analyses using our proposed QP determination methodologies with historical APM data, we found that the proposed QP and Partial QP Patient Count Thresholds are similar in magnitude and trajectory to those specified in the statute for the payment-based calculations. Due to varying attribution and organizational characteristics, we anticipate that using our proposed thresholds, the method—payment amount or patient count—that results in the most favorable QP status will likely vary across different Advanced APMs and Advanced APM Entities. We believe that each eligible clinician should have every opportunity to reach the QP threshold for each year, and do not intend to limit this opportunity by preemptively selecting one method over another.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We solicited comment on the proposed QP Patient Count Threshold and Partial QP Patient Count Threshold percentage values for both the Medicare Option and the All-Payer Combination Option.

The following is a summary of the comments we received regarding our proposed QP Patient Count Thresholds and Partial QP Patient Count Thresholds.

Comment: A few commenters did not support the proposed QP Patient Count Thresholds because they are lower than the correlating QP Payment Amount Thresholds. They stated that this would increase the number of QPs in the absence of a strong connection between performance and reward.

Response: We believe that what appear to be the lower QP Patient Count Thresholds actually represent a parallel to the QP Payment Amount Thresholds and that both reflect increasing rigor over time. We believe the QP Patient Count and Payment Amount Thresholds represent the same overall level of rigor by taking into account factors that cause the payment amount and patient count Threshold Scores to vary for an Advanced APM Entity group. These factors include, in addition to the obvious patient counts or payment amounts, characteristics of the markets in which APM Entities operate, the APMs’ attribution methodologies, and the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participation of different types of eligible clinicians such as specialists and non-physician practitioners. In addition to excluding payment amounts and patient counts that are categorically impossible to be in the numerator from the denominator of Threshold Score calculations, we believe that the thresholds (payment amount and patient count) should have the same overall level of rigor in order to effectuate the intent of the law to have thresholds that reward committed participation in Advanced APMs. Regarding the concern that a lower QP Patient Count Threshold would increase the number of eligible clinicians who are QPs without a connection between performance and reward, we believe that the Advanced APMs themselves are the drivers of cost and quality performance through their unique incentive designs. The QP thresholds are not replacements for those performance measurements in Advanced APMs. However, we believe that having a sufficient amount of payments or patients flowing through an Advanced APM contributes to ensuring eligible clinicians have a meaningful incentive to deliver high-value care across their entire practice. We also do not believe that we should aim to produce a particular number of QPs by calibrating the QP Patient Count Threshold. We want the QP thresholds to be meaningful and attainable independent of how many eligible clinicians ultimately become QPs.

Comment: Many commenters supported the proposed QP Patient Count Thresholds, although some expressed a degree of concern about the difficulty of meeting the higher percentage thresholds we proposed for future performance periods.

Response: We thank the commenters for their support. We believe that the higher thresholds in future years will be challenging but attainable for eligible clinicians in Advanced APMs. We also believe it is appropriate for increases in the QP Patient Count Threshold over the next several performance periods to parallel those for the QP Payment Amount Threshold.

Comment: Some commenters stated their belief that in order to become QPs, participants

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

in Advanced APMs should be held to a high performance standard—for instance, demonstrated cost and quality improvements in the Advanced APM—that increases over time. Conversely, other commenters believe that becoming a QP should be based upon participation in Advanced APMs and not on the actual performance within the Advanced APMs.

Response: We thank commenters for their input on how to achieve QP status. We do not believe that we have the legal authority to tie QP status to performance within the Advanced APMs. The statute specifies that becoming a QP is based on reaching the QP thresholds, which are based on the percentage of payments or patients provided services through an Advanced APM, not on other performance metrics such as cost and quality.

Comment: Many commenters stated that the QP thresholds—both payment amount and patient count—were too high, especially for certain types of Advanced APM Entities that have high ratios of specialists or act as referral centers, resulting in substantial amounts of care delivered to non-attributed beneficiaries. Some commenters stated that if such Advanced APM Entities cannot meet the QP thresholds, we would essentially be discouraging participation and penalizing them for fulfilling their missions of treating a wide range of beneficiaries and for utilizing their expertise as broadly as possible. Therefore, several commenters suggested that CMS further reduce the QP thresholds, both payment amount and patient count, to ensure participation is appropriately incentivized. Other commenters suggested that the QP thresholds be reduced differentially depending on the Advanced APM in order to tailor the thresholds to the particular context of an Advanced APM. Some commenters requested that we monitor the issue in the early years of implementation so that we can adjust our thresholds or methodologies for the later years if necessary.

Response: We thank the commenters for their thoughts on the QP thresholds. First, we reiterate that the payment amount thresholds are set by the statute and that we do not have the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

authority to change them in this final rule. Second, based on our preliminary analyses of historical participation in APMs, we believe that QP thresholds in the first years under both the payment amount and patient count thresholds are highly attainable by Advanced APM participants. We will closely monitor the results and consider whether the finalized patient count thresholds accurately represent participants' level of commitment to Advanced APMs in a manner similar to the payment amount thresholds. We understand that there may be some natural differences in Threshold Scores depending on the characteristics of a particular Advanced APM or its participants, but we believe the statute contemplates a single QP threshold for each performance period, and that it is preferable to have a single, simple set of QP thresholds applicable to all Advanced APM participants. We believe our proposed set of QP Patient Count Thresholds adhere to the statutory directive that we use percentage criteria for the QP Patient Count Thresholds that are similar to those for the QP Payment Amount Threshold.

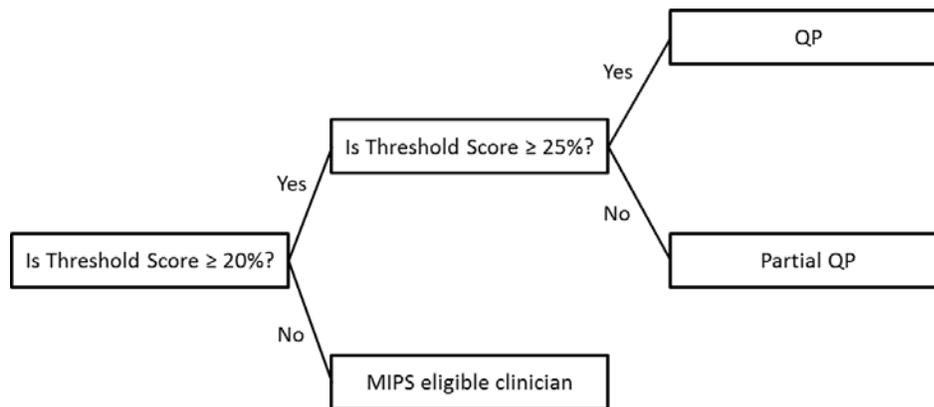

After considering the public comments, we are finalizing the QP Patient Count Thresholds and Partial QP Patient Count Thresholds as proposed, and we are finalizing the QP Payment Amount Threshold and Partial QP Payment Amount Thresholds as specified in statute.

We proposed that, beginning with payment year 2021, we would conduct the QP determination sequentially so that the Medicare Option is applied before the All-Payer Combination Option. We proposed to apply the All-Payer Combination Option only to an Advanced APM Entity group of eligible clinicians or eligible clinicians who do not meet either the QP Payment Amount or Patient Count Threshold under the Medicare Option but who do meet the lower Medicare threshold for the All-Payer Combination Option. This process is illustrated in Figures C and D of this final rule with comment period, which show that the first assessment is whether the Medicare QP Threshold has been met under either the Medicare Option or the All-Payer Combination Option.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

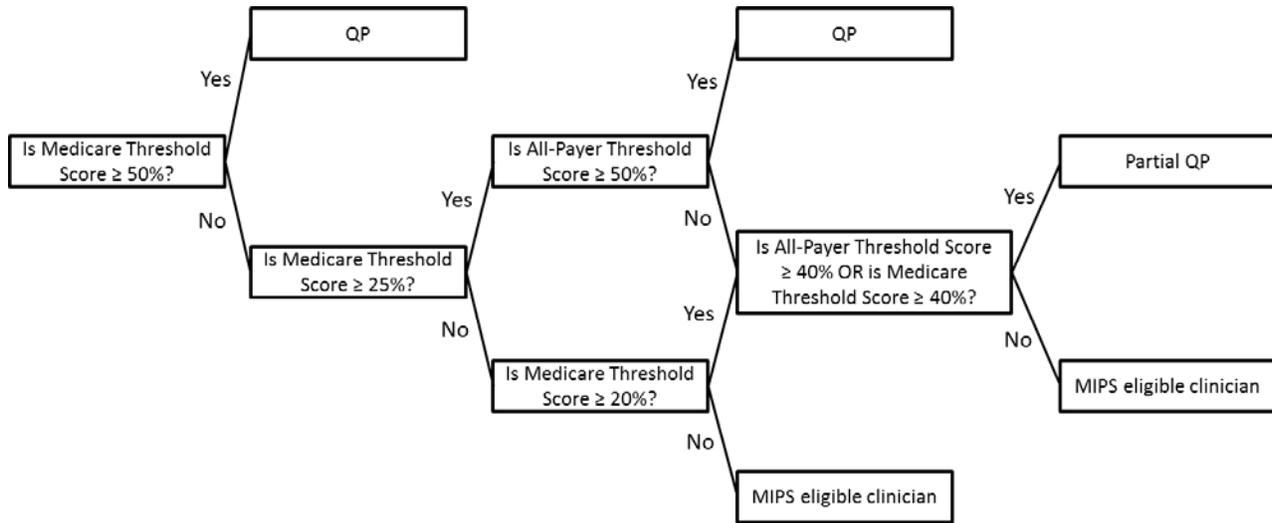

Because in addition to being a standalone path to QP status, the Medicare Option (either based on payment amounts or patient counts) is also a component of the All-Payer Combination Option, and because all eligible clinicians must reach at least a minimum Threshold Score through Advanced APMs to be QPs, we believe that this sequential approach streamlines the analytic and operational requirements to make QP determinations under the All-Payer Combination Option. Figure C illustrates the proposed process for making QP determinations under the Medicare Option for 2019 and 2020. Figure D illustrates the process proposed for making QP determinations under both the Medicare and All-Payer Combination Options for payment years 2021-2024. Figure E provides an example of the proposed process for making QP determinations in payment years 2023-2024. Figures C, D, and E only illustrate the payment amount method, but a similar process would apply for the patient count method.

**FIGURE C: QP Determination Tree, Payment Years 2019-2020**

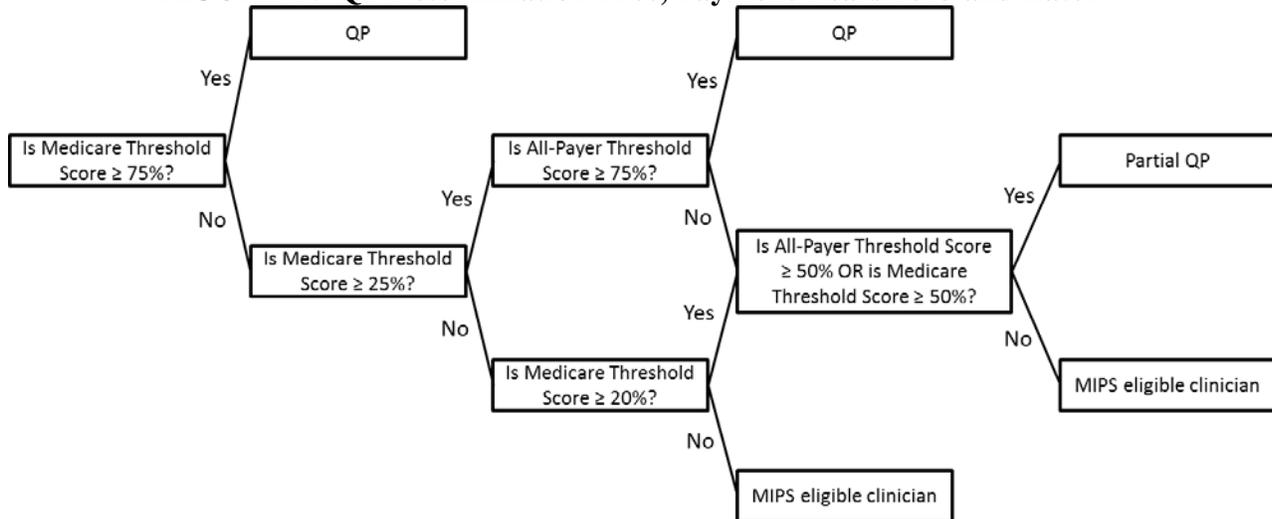

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

**FIGURE D: QP Determination Tree, Payment Years 2021-2022**

**FIGURE E: QP Determination Tree, Payment Years 2023 and Later**

The following is a summary of the comments we received regarding our proposal to assess Advanced APM Entities sequentially under the Medicare Option and, only if necessary, under the All-Payer Combination Option.

Comment: A few commenters expressed support for the sequential determination of QPs and Partial QPs in the Medicare Option and then the All-Payer Combination Option.

Response: We thank the commenters for their support.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are finalizing the policy as proposed. Beginning with payment year 2021, we will conduct the QP determination sequentially so that the Medicare Option is applied before the All-Payer Combination Option. We will apply the All-Payer Combination Option only to an Advanced APM Entity group of eligible clinicians who do not meet either the QP Payment Amount or Patient Count Thresholds under the Medicare Option but who do meet the lower Medicare threshold for the All-Payer Combination Option.

The following is a summary of comments regarding the QP determination process generally.

Comment: A few commenters expressed that the QP determination is too complex and that clinicians will not understand what is required to attain QP status. They recommended that we establish a more transparent and simple approach. Other commenters suggested that any level of participation in an Advanced APM should suffice for receiving the APM Incentive Payment. One commenter requested that CMS be more flexible in granting QP status.

Response: We are required by statute to apply payment amount or patient count thresholds in order to identify which eligible clinicians receive the APM Incentive Payment and are excluded from MIPS adjustments. We understand that this is a new process with certain inherent complexities, but we believe that in our proposed policies we have balanced the interests of simplicity and the need to accurately apply standards to an increasingly diverse array of Advanced APMs now and in the future. We will be providing education and technical assistance to help eligible clinicians understand the requirements to attain QP status.

Comment: Some commenters believe that the QP determination process discourages participation in Advanced APMs due to the uncertainty of the results of the Threshold Score. Similarly, one commenter suggested that those eligible clinicians and entities that have already invested heavily and currently participate in Advanced APMs should have an easier path to QP

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

determination that those who are new participants.

Response: We take seriously any potential incentives that could work against this program's purpose of increasing Advanced APM participation. Although we do not agree that our proposed and final QP determination policies will discourage participation, we intend to provide information and preliminary assessments based on historical data to help Advanced APM participants understand what their Threshold Scores would likely be in order to mitigate uncertainty about their likely QP status.

We disagree with the commenter that current APM participants should have an easier path to QP status than APM participants who have never previously participated in APMs. While we greatly appreciate the early adopters of Advanced APMs, we find no policy justification for making it relatively more difficult for those who have never participated in an Advanced APM to achieve QP status because, as stated above, a core purpose of this program is to increase Advanced APM participation.

a. Group Determination and Lists

(1) Group Determination

The statute consistently refers to an eligible clinician throughout section 1833(z) of the Act and clearly identifies that the QP determinations are to be made for an eligible clinician, whom we identify by a unique NPI. Thus, an eligible clinician is a person who may have multiple TIN/NPI combinations but only one NPI. In section 1833(z)(3)(B) of the Act, the definition of an eligible clinician includes a group of such clinicians.

We proposed, in general, to make the QP determination at a group level. As a result, the QP determination for the group would apply to all the individual eligible clinicians who are identified as part of an Advanced APM Entity. If that eligible clinician group's collective Threshold Score meets the relevant QP threshold, all eligible clinicians in that group would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

receive the same QP determination, applied to their NPI, for the relevant year. The QP determination calculations described in the proposed rule would be aggregated using data for all eligible clinicians participating in the Advanced APM Entity during the QP Performance Period.

We believe that this policy promotes administrative simplicity and collaboration among group members instead of promoting barriers, and while many beneficiaries are attributed to an APM Entity based on the services rendered by one eligible clinician, many of the eligible clinicians participating in the APM Entity may play a role in the actual diagnosis, treatment, and management of many beneficiaries in the APM Entity population. Each of these individual eligible clinicians could potentially view themselves as being instrumental in providing quality care to the beneficiary that is in line with the objectives of the APM, regardless of whether their individual services are counted towards APM-specific attribution methods.

An Advanced APM Entity faces the risks and rewards of participation in an Advanced APM as a single unit, and is responsible for performance metrics that are aggregated to the level of that entity. This policy is based on the premise that positive change occurs when entire organizations commit to participating in an Advanced APM and focusing on its cost and quality goals as a whole. It also mitigates situations in which individual eligible clinicians who practice together in an Advanced APM Entity receive different QP determinations and thus are treated differently for purposes of APM Incentive Payments, MIPS payment adjustments, and eventually, differential fee schedule updates under the PFS. We believe that such discrepancies could potentially lead to confusion and lack of cohesion among eligible clinicians and Advanced APM Entities and place additional burdens on eligible clinicians and organizations to track these differences. Additionally, we wish to avoid any additional burden, confusion, and operational difficulties for both eligible clinicians and CMS that would result from allowing eligible clinicians or Advanced APM Entities to elect whether to be assessed at the Advanced APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Entity level. We believe that a simple, overarching rule is preferable to adding extra variables to the already complex processes under this program.

The following is a summary of the comments we received regarding our proposal to make the QP determination at the Advanced APM Entity group level.

Comment: Most commenters expressed support for performing the Threshold Score calculations in this section at a group level defined by the Advanced APM Entity. Commenters stated that this was supportive of care coordination, organization cohesiveness, and the different clinician types supporting an Advanced APM Entity regardless of whether or not their services are tied directly to attribution. Some commenters were supportive but cautioned that this approach might be difficult to apply in certain Advanced APMs with Advanced APM Entities that have partial TINs or span multiple TINs.

Response: We thank the commenters for their support of this approach and agree that it aligns with the goals of Advanced APMs. We believe that this accommodates the various organizational structures across Advanced APMs because it relies upon the lists maintained under each APM and its particular rules.

Comment: One commenter stated that the exclusionary criteria under MIPS (first year of Medicare participation and low-volume threshold) should also apply to QP eligibility.

Response: We disagree with the commenter. Although the statute specified exclusionary criteria for MIPS, we find no statutory basis or policy rationale to exclude such eligible clinicians from QP determinations.

Comment: A few commenters recommended that the QP determinations be made at the TIN or NPI level instead of the Advanced APM Entity level. One commenter favored TIN level assessment in order to parallel the MIPS group reporting option and enable a greater degree of accuracy in a group's financial estimates.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We appreciate the potential advantages in certain scenarios for QP determinations to be made at TIN or NPI levels, but we continue to believe that QP determination at the Advanced APM Entity group level aligns with the goals of the Advanced APMs themselves and ultimately is more beneficial for a wider range of eligible clinicians who might not have an opportunity to be QPs individually or in smaller groups. We want to reinforce the collective responsibility of an Advanced APM Entity. However, as outlined below, we finalize two exceptions for situations in which we believe it is more appropriate to make the QP determination at the individual NPI level: (1) for individuals participating in multiple Advanced APM Entities, none of which meet the QP threshold as a group, and (2) for eligible clinicians on an Affiliated Practitioner List when that list is used for the QP determination because there are no eligible clinicians on a Participation List for the Advanced APM Entity. For the former exception, we believe that participation in multiple Advanced APMs demonstrates particular commitment to Advanced APMs. We believe it will be rare that all of an eligible clinician's multiple Advanced APM Entities would fail to meet the QP thresholds, but in such cases, the Threshold Scores of those Advanced APM Entities may not be indicative of the degree to which the eligible clinician has dedicated his or her practice to Advanced APMs. For the latter exception, eligible clinicians on an Affiliated Practitioner List, particularly those in episode payment models, do not necessarily have the same organizational relationship with one another as eligible clinicians who are on a Participation List. Unlike APM Entities that are defined as a group of eligible clinicians, affiliated practitioners may have no common connection to each other aside from their mutual relationship with a facility.

Comment: One commenter did not support the proposal to apply QP status to an eligible clinician's NPI rather than the TIN/NPI combination associated with an Advanced APM Entity.

Response: We disagree with the commenter and believe that applying QP status at the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

TIN/NPI level instead of at the NPI level as proposed would do a disservice to QPs. An eligible clinician identified by an NPI may have reassigned billing to multiple TINs, resulting in multiple TIN/NPI combinations being associated with one eligible clinician (NPI). If QP status was only applied to one of an eligible clinician's multiple TIN/NPI combinations, an eligible clinician who is a QP for only one TIN/NPI combination might still have to report under MIPS for another TIN/NPI combination. Further, under that approach, the APM Incentive Payment would be based on only a fraction of the eligible clinician's covered professional services instead of, as we believe is the most logical reading of the statute, all those services furnished by the individual eligible clinician, as represented by an NPI. Therefore, we do not believe that applying QP status only to a specific TIN/NPI combination is supportive of the program's goals to reward individuals for commitment to Advanced APM participation.

Except as explained further below, we are finalizing the proposed policy to make QP determinations collectively using the group of eligible clinicians in an Advanced APM Entity. We are finalizing two exceptions to this policy. First, if the eligible clinicians are identified on an Affiliated Practitioner List rather than a Participation List, as described in this section below, we will perform the QP determination individually for each eligible clinician on the Affiliated Practitioner List. We believe that eligible clinicians on Affiliated Practitioner Lists are unlike eligible clinicians on Participation Lists because, although they may have similar relationships with the Advanced APM Entity, they may not have any relationship with one another and do not represent a single organization unified in APM-related goals. Therefore, we believe considering these eligible clinicians individually is the most appropriate approach. We finalize the other exception regarding eligible clinicians participating in multiple Advanced APMs in section II.F.5.a.3. of this final rule with comment period.

We understand that, as with any group assessment, there will be some situations in which

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

individual Threshold Scores would differ from group Threshold Scores if assessed separately.

This could lead to some eligible clinicians becoming QPs when they would not have met the QP Threshold individually (a “free-rider” scenario) or, conversely, some eligible clinicians not becoming QPs within an Advanced APM Entity when they might have qualified individually (a dilution scenario). We believe that through the methodology we are finalizing for QP determinations in this final rule, the magnitude of such discrepancies will be relatively small compared to the value of maintaining Advanced APM Entity cohesion.

## (2) Groups Used for QP Determination

We proposed that the group of eligible clinicians used for a collective QP determination would consist of all the eligible clinicians participating in an Advanced APM Entity during a QP Performance Period. This would be defined by an Advanced APM Entity’s Participation List provided to CMS. We proposed that the Participation List for each Advanced APM Entity would be compiled from CMS-maintained lists that identify each eligible clinician by a unique TIN/NPI combination attached to the identifier of the Advanced APM Entity.

We proposed two exceptions to this rule. One exception is for Advanced APMs that do not identify eligible clinicians on a Participation List. In certain Advanced APMs, a Participation List may not include eligible clinicians. For example, in an APM where all Advanced APM Entities are hospitals, the Advanced APM Entity may not have eligible clinicians identified by a unique TIN/NPI combination attached to the identifier of the Advanced APM Entity on a Participation List. On the other hand, in certain Advanced APMs, an Advanced APM Entity may have a list (Affiliated Practitioner List) of other entities, including eligible clinicians, who are affiliated with and support the Advanced APM Entity in its participation in the Advanced APM but are not on the Participation List. For example, an Affiliated Practitioner List comprised of gainsharers under an APM might include eligible clinicians whereas a Participation List may

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

only include hospitals.

Where there is a Participation List that can be used to identify eligible clinicians, we proposed that it be the only list that is considered for the QP determination. We proposed that for Advanced APMs where the Participation List does not identify eligible clinicians, but there is an Affiliated Practitioners List of eligible clinicians who have a contractual relationship with the Advanced APM Entity based at least in part on supporting the Advanced APM Entity's quality or cost goals under the Advanced APM, we would use the eligible clinicians on the Affiliated Practitioner List for purposes of the QP determination. Where there is both a Participation List and an Affiliated Practitioner List that can be used to identify eligible clinicians under an Advanced APM, we proposed to only use the Participation List for purposes of the QP determination.

This proposed policy was developed to capture the group or groups of eligible clinicians who are the most closely associated with the performance of the Advanced APM Entity under an Advanced APM and to recognize their role in supporting the Advanced APM Entity. We believe this policy provides for flexibility in the design of Advanced APMs while providing the APM Incentive Payment to those eligible clinicians who are the most engaged in the Advanced APM.

We solicited comment on our proposals to define the eligible clinician group for QP determination based on the Participation List and the exception to use the Affiliated Practitioners List for Advanced APMs in which there are not eligible clinicians on the Participation List. We also solicited comment on whether to limit the proposed policy to the Medicare Option, as it may be less likely that Affiliated Practitioners support the Advanced APM Entity in Other Payer Advanced APMs and may be more difficult for us to distinguish based on information submitted to CMS by Advanced APM Entities. Because there may be Advanced APMs in the future that have multiple lists of Affiliated Practitioners, we sought comment on approaches for grouping

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

those separate lists for purposes of the QP determination.

The following is a summary of the comments we received regarding our proposals pertaining to defining the eligible clinician groups for QP determination.

Comment: Several commenters requested clarification on which list, the Participation List or Affiliated Practitioner List, would be used when an Advanced APM has both. One commenter requested clarification of the definition of the Participation List and another commenter requested clarification regarding the definition of Affiliated Practitioner, specifically if the definition varies by Advanced APM. Several commenters recommended that when an Advanced APM has both a Participation List and an Affiliated Practitioner List, the lists should be reconciled in order to include a broader group of eligible clinicians for purposes of the QP determination. Some commenters supported the distinction between participants on a Participation List and Affiliated Practitioners on an Affiliated Practitioner List for purposes of the QP determination.

A few commenters made specific comments on how the proposed policy relates to episode payment models. Some commenters suggested that if BPCI or CJR become Advanced APMs, CMS should accept a hospital's Affiliated Practitioner List for the QP determination. A commenter suggested that CMS create a process for APM Entities in episode payment models to report their Affiliated Practitioners out of concern that ACOs will exclude specialists so that their primary care physicians will as a group be QPs.

Response: A Participation List is a CMS-maintained list that includes the most central participants in an APM. Affiliated Practitioners are eligible clinicians who are more loosely affiliated with an Advanced APM Entity than those on a Participation List, and have a contractual relationship with the Advanced APM Entity based at least in part on supporting the Advanced APM Entity's quality or cost goals under the Advanced APM. The definitions of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Participation List and Affiliated Practitioner List are located at §414.1305. If the terms of an Advanced APM do not require a Participation List to identify eligible clinicians but do allow for eligible clinicians to be identified on an Affiliated Practitioner List, we would use the Affiliated Practitioner List for purposes of the QP determination. If an Advanced APM has both a Participation List and an Affiliated Practitioner List, we will only look at the Participation List for purposes of the QP determination, with the following exception.

In response to the comment requesting that we identify Affiliated Practitioners for the QP determination in BPCI, we are finalizing an exception that would allow for the appropriate identification of eligible clinicians in APMs that, like BPCI, have multiple types of participating APM Entities. Under this exception, we will use either the Participation List or the Affiliated Practitioner List depending on the type of APM Entity. This exception applies to Advanced APMs, such as some episode payment models, in which different types of APM Entities participate and some Advanced APM Entities may identify eligible clinicians on a Participation List, and others may have only an Affiliated Practitioner List. For these models, we will identify the eligible clinicians for QP determinations based on the composition of the Advanced APM Entity instead of at the Advanced APM level. Specifically, for these episode payment model Advanced APMs, we will determine which eligible clinicians will be included in the QP determination as follows: (1) for Advanced APM Entities that include and identify eligible clinicians on a Participation List, that Participation List will be used to define the Advanced APM Entity group, regardless of whether or not there is also an Affiliated Practitioner List or other list of eligible clinicians, and we will make QP determinations at the APM Entity group level; (2) for Advanced APM Entities that do not include and identify eligible clinicians on a Participation List and there is an Affiliated Practitioner List that identifies eligible clinicians, that Affiliated Practitioner List will be used to identify the eligible clinicians for purposes of QP

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

determination, and those eligible clinicians will be assessed individually. The structure of BPCI serves as a useful example to show how we would apply this policy. In a model like BPCI, when the APM Entity is a physician group practice that identifies eligible clinicians on a Participation List, we would use that list for purposes of the QP determination, even if there is also an Affiliated Practitioner List. When the APM Entity is a hospital that does not identify eligible clinicians on a Participation List, but it identifies eligible clinicians on an Affiliated Practitioner List, we would use that list for purposes of identifying eligible clinicians for the QP determination, and those eligible clinicians would be evaluated individually. While this policy is responsive to comments about APMs like BPCI, this policy does not change the design of the models within BPCI. We are also considering implementing a new voluntary APM that is an episode payment model for CY 2018 that could meet the criteria for this exception (81 FR 50793).

We believe this exception to making QP determinations at a group level appropriately identifies the eligible clinicians with the closest supporting role to the Advanced APM Entity in episode payment models. We would assess affiliated practitioners individually because affiliated practitioners do not necessarily have the same organizational relationship with one another as eligible clinicians on a Participation List have with one another. Unlike APM Entities that are defined as a group of eligible clinicians, affiliated practitioners may have no common connection to each other aside from their mutual relationship with a facility. Therefore, we believe that the rationale for group assessments does not apply to these individual eligible clinicians.

Comment: Several commenters requested that CMS develop a way to identify individual eligible clinicians who are employed by an Advanced APM Entity in an episode payment model and involved in episodes of care or require that the Advanced APM Entity provide CMS with a list of such clinicians. One commenter recommended that in addition to using Participation Lists

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

and Affiliated Practitioner Lists for purposes of QP determination, CMS should also use all eligible clinicians under a single TIN as a group of eligible clinicians, regardless of inclusion on one of these lists. Another commenter suggested that it may be preferable to only count eligible clinicians who can be used for beneficiary attribution in the Advanced APM. Another commenter suggested that eligible clinicians working with a partner teaching hospital that is an Advanced APM Entity should receive credit for participation in the Advanced APM, even if they do not have a formal arrangement with the Advanced APM Entity.

Response: We believe that the policy to use Participation Lists and Affiliated Practitioner Lists, when applicable, for purposes of the QP determination, captures the eligible clinicians who are most closely associated with the performance of the Advanced APM Entity under the Advanced APM. We do not believe that including clinicians for whom we have no other record of participation in an Advanced APM would be an accurate and equitable representation of the eligible clinicians that could become QPs through an Advanced APM. CMS defines an eligible clinician's role in an APM through his or her inclusion on specific CMS-maintained lists defined in each APM's terms and conditions or regulation or law, and we cannot verify relationships for which we do not maintain records. Further, we do not believe it would be useful to merge the Participation Lists with Affiliated Practitioner Lists to identify eligible clinicians for QP determinations because the clinicians on these lists have different relationships with an Advanced APM Entity.

The policy we are finalizing addresses which eligible clinicians, those on a Participation List or those on an Affiliated Practitioner List, will be considered for the QP determination. We believe that we should only capture those eligible clinicians affirmatively identified as the most central participants supporting an Advanced APM Entity for purposes of the QP determination. Many APMs have multiple "tiers" of eligible clinicians who may play different roles for an APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Entity, and the policy we are finalizing reflects those tiers so that only the eligible clinicians most responsible for the requirements of the Advanced APM relative to other tiers of eligible clinicians will be considered the central participants of an Advanced APM Entity. Where Advanced APM Entities have eligible clinicians identified on a Participation List, those eligible clinicians are the most central participants. Where Advanced APM Entities do not have eligible clinicians identified on a Participation List, but they do have eligible clinicians on an Affiliated Practitioner List, those eligible clinicians are the most central participants.

Comment: One commenter suggested that CMS provide some protections, flexibility, or an appeals process for those eligible clinicians who find themselves to be on what they believe to be the wrong list, especially during the first few years of adjusting to the Quality Payment Program.

Response: We understand that ensuring list accuracy can be a difficult process for organizations and clinicians to manage. List management takes place with the APMs themselves, and we are not developing any universal standards for how each APM collects, updates, and maintains its lists. However, because of the important implications in list management, we will closely monitor this issue in the first years of the Quality Payment Program, and on an ongoing basis.

We are finalizing the proposed policy with certain modifications, as follows:

- For Advanced APMs for which there is a Participation List that identifies eligible clinicians, that Participation List will be used to define the Advanced APM Entity group, regardless of whether there is also an Affiliated Practitioner List or other list of eligible clinicians associated with the Advanced APM. QP determinations will be made at the Advanced APM Entity group level.

- For Advanced APMs for which there is not a Participation List that identifies eligible

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clinicians and there is an Affiliated Practitioner List that identifies eligible clinicians, that Affiliated Practitioner List will be used to identify the eligible clinicians for purposes of QP determinations. Eligible clinicians on an Affiliated Practitioner List will be assessed individually, unlike eligible clinicians on a Participation List who are assessed as a group.

- For Advanced APMs, such as episode payment models, in which there are some Advanced APM Entities that include eligible clinicians on a Participation List and other Advanced APM Entities that identify eligible clinicians only on an Affiliated Practitioner List, we will identify eligible clinicians for QP determinations based on the composition of the Advanced APM Entity: (1) for Advanced APM Entities that include and identify eligible clinicians on a Participation List, that Participation List will be used to define the Advanced APM Entity group, regardless of whether or not there is also an Affiliated Practitioner List or other list of eligible clinicians, and those eligible clinicians will be assessed as a group; (2) for Advanced APM Entities that do not include and identify eligible clinicians on a Participation List and there is an Affiliated Practitioner List that identifies eligible clinicians, that Affiliated Practitioner List will be used to identify the eligible clinicians for purposes of QP determinations, and those eligible clinicians will be assessed individually.

As discussed in our response to comments above, we believe the relationship between eligible clinicians and APM Entities in APMs such as episode payment models can vary and that eligible clinicians on an Affiliated Practitioner List can be engaged in the goals of the Advanced APM in a similar manner as eligible clinicians on a Participation List depending on the characteristics of the Advanced APM Entity.

We are finalizing these policies on the identification of eligible clinicians for purposes of QP determinations only for the Medicare Option. We did not receive public comment on whether to extend this policy to the All-Payer Combination Option and believe it is prudent to first apply

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

this policy in the Medicare Option before considering whether to apply it in the All-Payer Combination Option through future rulemaking.

### (3) Exception for Participation in Multiple Advanced APMs

We proposed an exception to making QP determinations at the group level. Some eligible clinicians may participate in multiple Advanced APMs. For instance, an eligible clinician could participate in an ACO under the Shared Saving Program and an episode payment model with another entity, both of which have been determined to be Advanced APM Entities. In such a case, we proposed the following (81 FR 28320):

- Consistent with the general policy proposed above, if one or more of the Advanced APM Entities in which the eligible clinician participates meets the QP threshold, the eligible clinician becomes a QP.
- If none of the Advanced APM Entities in which the eligible clinician participates meet the QP threshold, CMS proposes to assess the eligible clinician individually, using combined information for services associated with that individual's NPI and furnished through all such eligible clinician's Advanced APM Entities during the QP Performance Period. We would adjust to assure that services are not double-counted (for example, a surgeon participating in an episode payment model, in which some of the procedures are performed on patients affiliated with an ACO that the surgeon is also a part of, would only have payments or patients from those procedures count once towards the QP determination).

We believe that this policy maintains the general simplicity of the Advanced APM Entity-level QP determination while acknowledging individual eligible clinicians who are participating in multiple advanced initiatives that support CMS goals. This also complements the policy described under the All-Payer Combination Option for QP determinations in which an eligible clinician may submit information on participation in Other Payer Advanced APMs to be

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assessed as an individual under that option in the event that the APM Entity or Entities in which the eligible clinician participates do not submit sufficient information.

We solicited comment on the proposal for exceptions to making QP determinations at the Advanced APM Entity level. In particular, we solicited comment on the merits of making all determinations at the individual eligible clinician level versus through some alternative grouping methodology. We also solicited comment on our proposal to assess an eligible clinician who participates in multiple Advanced APM Entities, and any other potential exceptions to the proposed general policy to make QP determinations at the Advanced APM level.

The following is a summary of the comments we received regarding our proposal to assess an eligible clinician individually for purposes of a QP determination in the event that the eligible clinician participates in multiple Advanced APM Entities, none of which meet the QP thresholds as a group.

Comment: Many commenters supported our proposal to evaluate the individual eligible clinician participating in multiple Advanced APMs if the individual is not determined to be a QP based on participation in any single Advanced APM. Some commenters suggested that for at least the first year, we allow any individuals or TINs within an Advanced APM Entity to be QPs if they reach the QP threshold independent of their Advanced APM Entities in order to ensure that as many eligible clinicians become QPs as possible.

Response: With respect to the alternative of allowing individual TINs or NPIs within an Advanced APM Entity to be assessed separately and to apply the most favorable result, we do not believe that approach would best reflect the collective participation toward shared goals that is fostered under APMs, and in particular, Advanced APMs. Like the APM Entity's performance under the APM, we believe group level determinations in the APM context involve collective and consistent responsibility for results, including QP determinations. We will have instances in

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

which eligible clinicians are assessed as a group and instances in which they are assessed as individuals, but we believe individual evaluation should be used only to address exceptional circumstances. The approach suggested by the commenters would effectively apply an individual assessment with a floor determined by the group performance. Such an alternative would erode the cooperative purpose of a group determination, and we continue to believe, as stated in the proposed rule, that APM participation is focused on collective responsibility for the cost and quality of care for Medicare beneficiaries.

Comment: One commenter requested clarification on how we would average or weight participation across multiple Advanced APMs.

Response: We appreciate the questions regarding how individuals would be assessed in the case of an eligible clinician participating in multiple Advanced APMs. Because we will make QP determinations using claims analyses, which enables us to connect services for beneficiaries to an eligible clinician's NPI, we would only need to add the numerator and denominator values together, and adjust for any duplication in the numerator or denominator. The formulas would be the same as if calculated for the group but based on the individual eligible clinician's activity at the NPI level.

We are finalizing the policy as proposed. If an eligible clinician participates in multiple Advanced APM Entities during a QP Performance Period, and is not determined to be a QP based on participation in any of those Advanced APM Entities, then we will assess the eligible clinician individually using combined information for services associated with that individual's NPI and furnished through all the eligible clinician's Advanced APM Entities during the QP Performance Period. This includes all Advanced APM Entities for which the eligible clinician is represented on either a Participation List or Affiliated Practitioner List that CMS uses for QP determinations in accordance with the identification policies described in this section of the final

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

rule with comment period. We will make adjustments to ensure that patients and payments for services that may be counted in the QP calculations for multiple Advanced APM Entities (for example, payments for services furnished to a beneficiary attributed to an ACO that are also part of an episode in an episode payment model) are not double-counted for the individual.

We believe that this policy maintains the general principles behind Advanced APM Entity-level QP determinations while acknowledging the broader commitment of individual eligible clinicians who are participating in multiple Advanced APMs. We believe considering these eligible clinicians individually is the most reasonable approach to capturing the multiple potential permutations of participation in Advanced APMs and providing eligible clinicians an equitable opportunity to become a QP.

#### (4) Timing of Group Identification for Eligible Clinicians

We proposed that we would identify the eligible clinician group for each Advanced APM Entity at a specified point in time for each QP Performance Period. We proposed that this point-in-time assessment will occur on December 31 of each QP Performance Period.

We solicited comments on our proposal to define the Advanced APM Entity group based on the Participation List for each Advanced APM Entity at a specified point in time during the QP Performance Period. We also solicited comment on the proposed date of the Participation List assessment, and whether this date should be earlier in the QP Performance Period or should instead be a range of time (81 FR 28320).

The following is a summary of the comments we received regarding our proposal to define the Advanced APM Entity group for purposes of the QP determination by take a point-in-time snapshot of eligible clinicians in an Advanced APM Entity according to Participation Lists on December 31 of the QP Performance Period.

Comment: Many commenters expressed concerns with the proposed policy of a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

December 31 snapshot of Participation Lists in order to determine the Advanced APM Entity group for QP determinations and, if applicable, MIPS reporting and scoring under the APM scoring standard. Some commenters stated that December 31 captures APMs that start or allow additions to Participation Lists during the calendar year, but for APMs such as the Next Generation ACO Model in which Participation Lists are set at the beginning of the year and can only be reduced during the year, December 31 does not necessarily capture the entity as it operates throughout the year. Similarly, commenters noted that the proposed policy both does not incentivize participation during the early part of a year and is not fair to eligible clinicians who may have been part of the Advanced APM Entity for large portions of the QP Performance Period but not on the Participation List on the last day of the year. Finally, many commenters stressed that because not being on an Advanced APM Entity's Participation List means that the eligible clinician must make arrangements for MIPS reporting for the services furnished under the TIN/NPI combination associated with the Advanced APM Entity, and learning that late in the year would make the necessary preparations to perform well under MIPS in a limited amount of time very difficult.

Response: We agree with commenters that a single snapshot on December 31 or the last day of the QP Performance Period may create some potentially inequitable or burdensome situations. Therefore, as described in this section, we are finalizing a policy that moves away from a single, end of year snapshot to instead use several snapshots through the year that we believe better represent eligible clinician participation in Advanced APMs over the course of a year for purposes of QP determinations.

Comment: A few commenters suggested that we use a range of time during which presence on a Participation List would be sufficient to be included in the group. Similarly, some commenters suggested that presence on the list for a certain number of consecutive days (that is,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

on the Participation List for 60 days) should result in inclusion in the group.

Response: We thank the commenters for the suggestion. These ideas both have merit, and we considered them carefully. We are finalizing a different policy because, under these suggested options, we believe APM list management will be more difficult. We want the list used for purposes of an APM and for purposes of the Quality Payment Program to be as consistent as possible so that APM Entities may easily understand how list changes have impacts across programs. Under the commenters' proposals, at any single point in time, there will likely be inconsistencies between the APM Entity's Participation List and the list we would use for QP determinations, which would be very challenging to explain and to manage for both CMS and Advanced APM Entities. Specifically with regard to the proposal to have a range of time during which anyone on the Participation List would be included in the APM Entity group, many APM Entities make changes to their Participation Lists at certain times of the year, especially during the first quarter, and we do not want to include eligible clinicians in the APM Entity group if they were only on a list fleetingly during a period of administrative transitions. We believe that the minimum length of time proposal ensures that eligible clinicians participate sufficiently before being included in an APM Entity group, but APM Entities would not have the ability on a given date to know which eligible clinicians will be included in the group because some may leave at staggered points in time prior to participating for the necessary number of days.

Comment: Several commenters suggested that we allow each Advanced APM Entity to submit a list, which may vary from the one used under the Advanced APM, for purposes of the QP determination in order to accurately reflect what the entity believes is the most recent and salient representation of its group of eligible clinicians participating in the Advanced APM Entity. Other commenters suggested that each Advanced APM select its own snapshot based on its particular operations or change its Participation List rules to allow adjustments in preparation

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for this snapshot date. On the other hand, several commenters expressed a desire for as much automation as possible, such as through claims analyses and use of PECOS data, to avoid administratively burdensome list submission and avoid potential list inaccuracies and inconsistencies.

Response: We thank the commenters for their suggestions. We understand that allowing a distinct list submission solely for QP determinations purposes or selecting a snapshot date would maximize the control an Advanced APM Entity has over the group's Threshold Score. However, we believe these options would be ripe for potential gaming and could result in inconsistencies between the group of eligible clinicians actually responsible for performance under the Advanced APM according to CMS records and the list the Advanced APM might identify for the QP determination. We believe it is most appropriate to align QP determinations with records of participation under the Advanced APMs themselves. Although changing how any particular APM manages participation by eligible clinicians and APM Entities is beyond the scope of this final rule with comment period, we understand how certain changes could be made in Advanced APMs to help Advanced APM Entities sync up with the Quality Payment Program goals. Finally, we agree with commenters in principle that automation of the identification process for eligible clinicians in Advanced APMs is a valuable goal. We do not want to create additional administrative tasks, such as maintaining and submitting a unique Participation List, when we can use available information in CMS systems.

Comment: Many commenters expressed support for a December 31 snapshot date because the fluid nature of participation during a year may result in eligible clinicians joining and leaving an Advanced APM Entity in relatively short periods of time during the year.

Response: We thank the commenters for their support of the proposed policy, but because of the issues raised by other commenters, we are finalizing a policy that we believe retains many

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of the benefits of an end-of-year or end-of-QP Performance Period snapshot while trying to provider greater certainty earlier in the year.

To address the comments we received, especially the concerns regarding eligible clinicians not knowing whether they are part of an Advanced APM Entity for purposes of QP determinations until the end of the calendar year, we are finalizing a modified process for identifying the APM Entity group (individual eligible clinicians in the case of an Affiliated Practitioner List) to use a series of three “snapshots” of an APM Entity’s Participation List (or Affiliated Practitioner List)) during the QP Performance Period. Each snapshot may add eligible clinicians to the APM Entity group or capture new affiliated practitioners who were not previously identified as part of the group or as individuals in the Advanced APM, but once determined to be a participant in an APM Entity for the QP Performance Period at any of the three snapshots, an eligible clinician will be considered by CMS for QP determinations as part of an APM Entity group, or as an individual, as appropriate, regardless of whether they are included on a Participation List or Affiliated Practitioner List in later snapshots. The first snapshot will be on March 31 of the QP Performance Period, the second snapshot will be on June 30 of the QP Performance Period, and the third snapshot will be on the August 31, which will be the last day of the QP Performance Period.

Each of these snapshots will establish and then add to the APM Entity group used for purposes of the QP determinations made for the QP Performance Period described in this section. In the event that the APM Entity participates in a MIPS APM and is not excluded from MIPS, the final APM Entity group after the third snapshot will be also be the APM Entity group used for purposes of MIPS group reporting and scoring under the APM scoring standard described in section II.e.3.h. of this final rule with comment period.

We believe that this final policy accommodates the variety of policies in different models

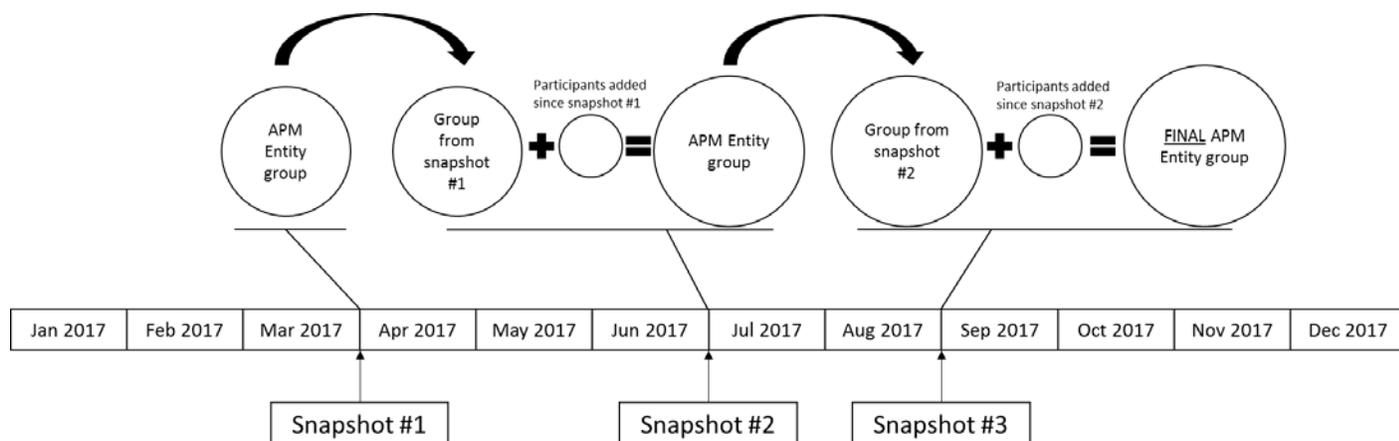

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

regarding the adding or dropping of APM participants so that we capture the eligible clinicians who have meaningfully participated in an Advanced APM Entity during a QP Performance Period. Most importantly, we believe that, in combination with the final policy on the QP Performance Period, this policy allows for substantially greater certainty at an earlier point in time of an eligible clinician's status, first as a participant or affiliated practitioner in an Advanced APM or MIPS APM, and then as a QP or MIPS eligible clinician, as compared to the proposed policy. Figure F illustrates the three additive snapshots we will use to identify the participants in an APM Entity.

We acknowledge that use of point-in-time snapshots may result in some eligible clinicians being captured on Participation Lists or Affiliated Practitioner Lists when they have only been on such a list for a short period of time. Although we believe that most APMs have list management rules to inhibit potential manipulation and that large numbers of additions to a Participation List may reduce an Advanced APM Entity's Threshold Score, we will monitor whether APM Entities systematically construct their lists in a manner that inappropriately affects the assessment of participation in Advanced APMs. In response, we may modify our policy through future rulemaking to address any such issues.

**FIGURE F: Determining the APM Entity Group Through Participation List Snapshots**

**b. QP Performance Period**

According to section 1833(z)(2) of the Act, we are required to determine QP and Partial QP status based on payment amounts or patient counts during the most recent period for which data are available, which may be less than a year. We proposed that the QP Performance Period is the full calendar year that aligns with the MIPS performance period (for instance, 2017 would be the QP Performance Period for the 2019 payment year). We believe that having a QP Performance Period that concludes 1 year and one day before the payment year would enable us to provide all eligible clinicians participating in Advanced APMs the best opportunity to monitor their performance through the Advanced APM and make the most informed decisions regarding their decision whether to not to be subject to MIPS in the event that they become a Partial QP. We solicited comment on this proposal and any alternative QP Performance Period timeframes that would both enable meaningful QP assessment and ensure operational alignment with MIPS.

The following is a summary of the comments we received regarding our proposal that the QP Performance Period would be the full calendar year 2 years prior to the payment year.

Comment: Many commenters expressed concern that under the proposed QP Performance Period, participants in Advanced APMs would not know their QP status until after

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

the end of the MIPS submission period. As a result, prudent Advanced APM participants would proactively report to MIPS in order to ensure that, in the event they do not reach the QP thresholds, they have an opportunity to fare well under MIPS. Most of these commenters suggested that QP determinations be made earlier so that QPs know their status in sufficient time to avoid unnecessary MIPS reporting. Whereas most of these commenters agreed generally that the determinations should be completed during the QP Performance Period in order to avoid the administrative task of reporting to MIPS, some commenters suggested that QP determinations be made as early as the spring of the QP Performance Period in order to prevent as much unnecessary MIPS-related activity as possible, such as the performance necessary for the improvement activities and advancing care information performance categories. Other commenters went further and stated that QP determinations should be completed prior to or at the very beginning of the QP Performance Period. To enable these very early determinations, commenters recognized that the calculations would have to be made using historical data from 2016 or by issuing presumptive determinations with MIPS adjustment accommodations in the event that actual results differed from those predicted. Several commenters requested that we at least mitigate the issue by providing as much preliminary data as possible so that Advanced APM participants may clearly understand their possible and likely outcomes.

Response: Although we designed the APM scoring standard in section II.E.3.h. of this final rule with comment period to reduce the reporting burden, we agree with commenters that it is only part of the solution. We disagree with commenters who recommended using 2016 as the QP Performance Period or implied that we should use 2016 data by suggesting that we make QP determinations for 2019 at the beginning of 2017. First, such a proposal would further remove the performance timeframe from the corresponding reward; second, the purpose of a performance period is to base a determination on actual participation in Advanced APMs during

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that period, and the applicable “performance” to attain QP status is participation in Advanced APMs; third, a performance period of 2016 would severely restrict access to QP status because there were fewer opportunities to participate in APMs that could be considered Advanced APMs in 2016 than in 2017; and fourth, it is very important to base these determinations on robust, reliable data instead of historical abstractions or future predictions.

That said, we agree in principle that earlier notification of QP status is optimal and would prevent wasted time and resources. Our analyses indicate that one calendar quarter’s data is sufficiently reliable and consistent with full year results to make early final QP determinations using those data. Thus, we are modifying our proposed policy in this final rule, as explained more fully below, to incorporate QP determinations during the calendar year based on data from less than the full QP Performance Period. Any such QP determination made during the QP Performance Period will be considered final. QP determinations may be rescinded in the event that an Advanced APM Entity is terminated from an Advanced APM, voluntarily or involuntarily, prior to August 31 of the QP Performance Period, or in the event of eligible clinician or Advanced APM Entity program integrity violations, as described in section II.F.9. of this final rule with comment period. We also intend to provide preliminary information to eligible clinicians participating in an Advanced APM early in the QP Performance Period in order to help participants assess their likelihood of becoming a QP for a year. For the first performance year, we will calculate hypothetical Threshold Scores based on historical claims data and current attribution data that represent an approximation of QP status as if the eligible clinicians had participated in an Advanced APM in 2016.

Comment: Many commenters suggested that CMS include a later time period for the QP Performance Period so that there is a smaller gap in time between the QP Performance Period and the payment year (for example, 2018 Advanced APM participation would determine QP

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

status for the 2019 payment year). Commenters expressed a desire to have an opportunity following the publication of this final rule with comment period to join an Advanced APM and receive the first APM Incentive Payment. Some commenters suggested keeping the QP Performance Period as proposed but adjusting the Participation List snapshot date to January 1 of the year after the QP Performance in order to capture new participants in Advanced APMs for inclusion in the QP determination. Other commenters generally urged us to use 2018 Advanced APM participation to make QP determinations for the 2019 payment year.

Response: In isolation, we agree that a QP Performance Period during the calendar year immediately prior to the payment year would provide certain advantages over one that is during the calendar year 2 years prior to the payment year. However, using 2018 Advanced APM participation information to make QP determinations for the 2019 payment year would raise several significant complications. First, we do not believe we should “double-count” performance for two different payment years because we believe the APM Incentive Payment is intended to reflect and reward Advanced APM participation for a specific, delineated period that should logically align with common APM operational functions and timelines. Crossing calendar years would lead to highly unreliable and disjointed data because Participation Lists often change substantially between calendar years, and we cannot assume that the performance of a previous year’s group of participants would be replicated in a new year with different participants and different attributed beneficiaries. Second, as stated in the previous response regarding a 2016 QP Performance Period for the 2019 payment year, we believe it is paramount that we use actual Advanced APM participation information rather than proxies for participation, which would be the case for new entrants into an Advanced APM on January 1 under the first commenter’s proposal. We also believe that we need data from at least one calendar quarter of activity in order to consider the data reliable, so we do not believe that one day of Advanced

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM participation is sufficient to reliably calculate a Threshold Score for eligible clinicians; any 2017 data would be derived from performance while such new Advanced APM participants were not Advanced APM participants. Finally, the relationship between QP determinations and MIPS reporting drives the need for determinations based on an earlier timeframe, and earlier QP determinations rather than later determinations. At the very latest, we need to ensure that all QPs for a year are removed from the MIPS eligible clinician cohort in sufficient time for us to make the requisite budget neutrality calculations, which in turn drives the calculation of MIPS payment adjustments for a year. We are also modifying our proposals to be responsive to many commenters who want to know as early as possible whether or not they will need to report under MIPS, and if so, which groups and reporting mechanisms they will use for reporting.

Comment: One commenter requested that the first QP Performance Period start on July 1, 2017 instead of January 1, 2017, because of the close proximity of January 1 to the publication of this final rule with comment period.

Response: We disagree with the commenter and note that the QP determination described in this section is different in nature from MIPS. Unlike with MIPS, the QP determination requires no reporting or directed activity by Advanced APM participants beyond what is required in the Advanced APMs themselves. We believe that starting the QP Performance Period later in 2017 would actually do a disservice to Advanced APM participants because they potentially would not be able to receive due credit for their participation early in the year. We also do not believe a later start for the QP Performance Period would provide a meaningfully greater opportunity to eligible clinicians to join an Advanced APM in the event that they were not part of one at the beginning of 2017.

We are modifying our proposals for the QP Performance Period and the timing of QP determinations. Instead of the proposed policy, we are finalizing a QP Performance Period that

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

runs from January 1 through August 31 of the calendar year that is 2 years prior to the payment year. During that QP Performance Period, we will make QP determinations at three separate times, each of which would be a final determination for the eligible clinicians who are determined to be QPs. The QP Performance Period and the three separate QP determinations apply similarly for both the group of eligible clinicians on a Participation List and the individual eligible clinicians on an Affiliated Practitioner List.

The first QP determination of the QP Performance Period will be made for all eligible clinicians who are identified as Advanced APM participants eligible to be QPs, either through a Participation List or Affiliated Practitioner List as described above, as of March 31 using data for that Advanced APM Entity group from January 1 through March 31 of that year. If the APM Entity group meets the QP threshold under this first assessment, then all eligible clinicians in the Advanced APM Entity group will be QPs for purposes of the respective payment year unless the Advanced APM Entity's participation in the Advanced APM is voluntarily or involuntarily terminated prior to the end of the QP Performance Period, or in the event of eligible clinician or Advanced APM Entity program integrity violations, as described in section II.F.9. of this final rule with comment period. These same procedures apply to the first QP determination made for individual eligible clinicians on an Advanced APM Entity's Affiliated Practitioner List or individual eligible clinicians in multiple Advanced APMs whose Advanced APM Entity groups did not meet the QP threshold.

In the event that the Advanced APM Entity group did not meet the QP threshold at the first QP determination, or if the Advanced APM Entity group includes eligible clinicians who were not part of the Advanced APM Entity group at the first QP determination, we will make a second QP determination for all eligible clinicians in the Advanced APM Entity at the first QP determination plus any additional eligible clinicians who are on the Participation List as of June

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

30 using data for that Advanced APM Entity group from January 1 through June 30 of that QP Performance Period. If the Advanced APM Entity group meets the QP threshold, then all eligible clinicians in the Advanced APM Entity group will be QPs for the payment year unless the Advanced APM Entity's participation in the Advanced APM is voluntarily or involuntarily terminated prior to the end of the QP Performance Period, or in the event of eligible clinician or Advanced APM Entity program integrity violations, as described in section II.F.9. of this final rule with comment period. If the Advanced APM Entity group does not meet the QP threshold at the second determination but did meet the QP threshold at the first determination, CMS would not revise the QP status of the eligible clinicians who were previously determined to be QPs, but any additional eligible clinicians who were in the Advanced APM Entity group at the second determination would not be QPs for the payment year through the group determination. If an Advanced APM Entity group meets the threshold in both the first and second determination, but some eligible clinicians no longer remain on the Participation List for the second determination, those eligible clinicians will still be considered QPs. These same procedures apply to the second QP determination made for individual eligible clinicians on the Advanced APM Entity's Affiliated Practitioner List or individual eligible clinicians in multiple Advanced APMs whose Advanced APM Entity groups did not meet the QP threshold.

In the event that the Advanced APM Entity group did not meet the QP threshold under the first or second QP determination or if the Advanced APM Entity group includes eligible clinicians who were not part of the Advanced APM Entity group at the second QP determination, we will make a third QP determination for all eligible clinicians on the Advanced APM Entity's Participation List from the first and second QP determinations plus any additional eligible clinicians who are on the Participation List as of August 31 using data for that Advanced APM Entity group from January 1 through August 31 of that QP Performance Period. If the Advanced

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM Entity group meets the QP thresholds, then all eligible clinicians in the Advanced APM Entity group will be QPs for the payment year unless the Advanced APM Entity's participation in the Advanced APM is voluntarily or involuntarily terminated prior to the end of the QP Performance Period. If the Advanced APM Entity group does not meet the QP threshold at the third determination but did meet the QP threshold at a previous determination, CMS would not revise the QP status of the eligible clinicians who were previously determined to be QPs, but any additional eligible clinicians who were only in the Advanced APM Entity group at the third QP determination would not be QPs for the payment year. If an Advanced APM Entity group meets the QP threshold in both the third determination and a previous determination, but some eligible clinicians no longer remain in the Advanced APM Entity at the third determination, those eligible clinicians will still be considered QPs. These same procedures apply to the third QP determination made for individual eligible clinicians on the Advanced APM Entity's Affiliated Practitioner List or individual eligible clinicians in multiple Advanced APMs whose Advanced APM Entity groups did not meet the QP threshold.

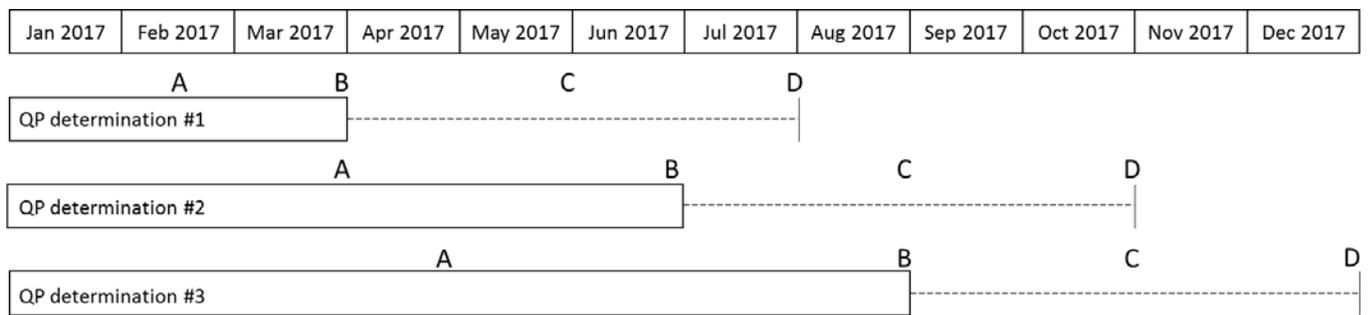

For each of the three QP determinations, we will allow for 3 months' claims run-out before calculating the Threshold Scores so that the three QP determinations will be made approximately 4 months after the end of that determination time period. Therefore, the last of these three QP determinations will take place on or around January 1 of the subsequent calendar year, which is the year immediately prior to the payment year. This way, eligible clinicians will know of their QP status prior to or near the beginning of the MIPS data submission period and know whether they should report to MIPS for the applicable year. Additionally, for purposes of this policy, we do not consider the ending of an Advanced APM's operations to be the voluntary or involuntary termination of an Advanced APM Entity. We consider an Advanced APM's end to be the natural and scheduled close rather than a "dropping out" of participants from the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. Advanced APM.

Figure G illustrates the three QP determinations during a QP Performance Period and the associated period of claims data used for QP determination (A), the Participation List or Affiliated Practitioner List snapshot date (B), the claims run-out period (C), and the estimated completion date of the QP determination (D).

**FIGURE G: QP Performance Period**

c. Partial QP Election to Report to MIPS

Section 1848(q)(1)(C)(ii)(II) of the Act excludes from the definition of MIPS eligible clinician an eligible clinician who is a Partial QP for a year. However, under section 1848(q)(1)(C)(vii) of the Act, an eligible clinician who is a Partial QP for a year and reports on applicable measures and activities as required under the MIPS is considered to be a MIPS eligible clinician for the year. To carry out these provisions, we proposed to require that each Advanced APM Entity must make an election each year on behalf of all of its identified participating eligible clinicians on whether to report under MIPS in the event that the eligible clinicians participating in the Advanced APM Entity are determined as a group to be Partial QPs for a year. We proposed that the Advanced APM Entity could change its election for a year at any time during the QP Performance Period, but the election would become permanent at the close of the QP Performance Period. We believe that this is consistent with our proposed general policy to make QP determinations at the Advanced APM Entity level, and with related MIPS

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

policies described in section II.E.3.h. of this final rule with comment period, under which we proposed that each APM Entity would be considered a group for purposes of MIPS reporting.

Therefore, we believe that the decision of whether to report and subsequently be subject to MIPS adjustments should also be made at the group level. We solicited comment on whether the Advanced APM Entity or each individual eligible clinician should make the Partial QP MIPS reporting election.

As discussed in section II.E.3.h. of this final rule with comment period, we recognize that the Shared Savings Program eligible clinicians participate as a complete TIN such that all of the eligible clinician participants in the participant billing TIN participate in the Shared Savings Program. Therefore, we also solicited comment on an alternative approach for Shared Savings Program APM Entities in which each individual billing TIN participating in the APM Entity would make the Partial QP election on behalf of its individual eligible clinicians and that election would be applied to all eligible clinicians in that individual billing TIN, as opposed to having the APM Entity (ACO) make the Partial QP election. We stated that we would only undertake this alternative paired with determining a MIPS final score for each TIN within an APM Entity (ACO) at the TIN level, an alternative discussed under the APM scoring standard in the proposed rule.

Our proposal that Partial QPs may choose whether to report to MIPS has two additional interactions with other proposed policies. First, because we proposed unique MIPS scoring policies for MIPS eligible clinicians participating in certain APMs, the election by the APM Entity not to report under MIPS is in effect a decision to tell us not to score the information submitted by the APM Entity under MIPS. Under our proposal, that decision would be made at the APM Entity level. APM Entities and eligible clinicians would continue to report to their respective APMs as required under the terms of their participation agreements with us.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Second, given the proposed timeframe for QP determinations under section II.F.5.a. of the proposed rule (81 FR 28313), our proposed treatment of claims run-out, claims adjustments, supplemental service payments, and alternative payment methods for purposes of QP determination (further detailed in section II.F.8 of the proposed rule (81 FR 28339)), and the and subsequent notification of QP determinations proposed under section II.F.5.d. of the proposed rule (81 FR 28322), eligible clinicians who become Partial QPs would not receive notification of this status until after the proposed timeframe for the MIPS reporting period will have closed. Although the information necessary for MIPS reporting would already be prepared in our systems by the time the Partial QP determination is made, a prospective election by the Advanced APM Entity to not be scored under MIPS and receive a MIPS payment adjustment would signal us to not transfer information from our reporting system to the MIPS scoring system in the event of a Partial QP determination, and that any submitted information is not to be used for purposes of a MIPS assessment or payment adjustment. Thus, by choosing not to report under MIPS, those Advanced APM Entities and eligible clinicians determined to be Partial QPs would be exempted from the MIPS payment adjustment for that year. We solicited comment on the timing and process for Advanced APM Entities to elect whether to be subject to MIPS in the event of a Partial QP determination.

The following is a summary of the comments we received regarding our proposal for Advanced APM Entities to determine whether or not to be subject to MIPS in the event that their eligible clinicians are determined to be Partial QPs.

Comment: Several commenters expressed opinions about the level at which the Partial QP decision is made of whether or not to report to MIPS. Most of these commenters stated strong support for the proposed policy that the decision be made at the APM Entity level in order to reinforce the collective nature of APM participation, and, in the event the group is subject to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

MIPS through a Partial QP election or missing the Partial QP and QP thresholds, the use of the APM Entity as the defining group for MIPS scoring. Other commenters stated support for QPs to make the decision at a TIN level in order to align with billing, other activities outside the APM context, and the TIN-based structure of the Shared Savings Program. A few commenters expressed that the decision should be made individually by each eligible clinician.

Response: We agree that although there could be some advantages to TIN-level Partial QP decisions, it is most appropriate to retain consistency within the Quality Payment Program in which eligible clinicians in APMs are primarily assessed at the APM Entity level. In the cases for which we make the Partial QP determination at the individual eligible clinician level, those individual eligible clinicians would accordingly make the Partial QP election of whether to be subject to MIPS payment adjustments at an individual level.

Comment: Some commenters expressed general support for the Partial QP election policy because it enables a degree of flexibility and choice to recognize those who participate in Advanced APMs to some extent, despite the fact that the eligible clinicians did not reach the QP threshold.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern about the timing of the Partial QP determinations. They stated that, as proposed, Partial QPs would not be able to make a fully-informed decisions because they would make their decision of whether or not to be subject to MIPS prior to knowing their ultimate QP status; therefore, Partial QP determinations should be made earlier to avoid prospective decisions.

Response: We agree with commenters that Partial QP decisions regarding MIPS should not be made without any information regarding a group's QP status. We believe that we resolve this issue through the finalized QP Performance Period policy so that all Advanced APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

participants will know if they are Partial QPs by the beginning of the MIPS submission period and will not need to make MIPS decisions as Partial QPs prior to that point in time.

Comment: Some commenters were concerned that Partial QPs would not have enough information to make decisions about whether to report to MIPS.

Response: We note that no eligible clinicians, regardless of whether they are Partial QPs, will be able to know their MIPS payment adjustments until they are actually announced just before the payment year, so a Partial QP decision to report to MIPS does carry with it some unavoidable uncertainty. Each Advanced APM Entity will need to weigh its options of the burden of reporting and likelihood of positive MIPS adjustments with the certainty of choosing exclusion from MIPS payment adjustments, which could be upward, neutral, or downward adjustments for the payment year.

Comment: Some commenters suggested alternatives to the consequences of Partial QP status. One commenter recommended that Partial QPs receive a partial bonus payment. Another commenter recommended that Partial QPs who report MIPS data should receive the higher amount of the MIPS adjustments or the neutral payment adjustment. In other words, the commenter suggested that MIPS adjustments should apply if positive but not apply if negative.

Response: We appreciate the ideas for Partial QP policies, but we do not believe the statute provides for the kinds of Partial QP incentives suggested by the commenter.

In consideration of the comments and the modifications we are making to the proposed QP Performance Period policies, we are not finalizing the proposed policy that Advanced APM Entities would make prospective elections regarding whether or not to score their MIPS data in the event that they are determined to be Partial QPs. Instead, we are finalizing a modified policy such that, following a final determination that eligible clinicians in an Advanced APM Entity group are Partial QPs for a year, the Advanced APM Entity will make an election whether to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

report to MIPS, thus making all eligible clinicians in the Advanced APM Entity group subject to MIPS reporting requirements and payment adjustments for the year; if the Advanced APM Entity elects not to report, all eligible clinicians in the APM Entity group will be excluded from MIPS adjustments. In the cases where the QP determination is made at the individual eligible clinician level, if the eligible clinician is determined to be a Partial QP, the eligible clinician will make the election whether to report to MIPS and then be subject to MIPS reporting requirements and payment adjustments.

A Partial QP who elects not to report to MIPS, whether based on the decision of the APM Entity or the individual eligible clinician, similar to QPs, is excluded from MIPS across all TINs associated with that Partial QP's NPI. Partial QPs do not under any circumstance receive the APM Incentive Payment.

Under this finalized policy, only Partial QPs must make this election after the Partial QP determination is made. The finalized QP Performance Period and QP determination policies apply to Partial QP determinations and enable Partial QP determinations to be made in a timeframe that makes the proposed prospective elections unnecessary. This means that Advanced APM Entities do not make a Partial QP decision on behalf of their constituent eligible clinicians unless and until that group actually is determined to be a Partial QP. Similarly, eligible clinicians for whom we make individual QP determinations do not elect whether to report to MIPS unless and until the eligible clinician is determined to be a Partial QP for the year.

We also clarify how we consider the absence of an explicit election. For situations in which the APM Entity is responsible for making the determination on behalf of all eligible clinicians in the APM Entity group, the group of Partial QPs will not participate in MIPS unless the APM Entity opts the group into MIPS participation so that no actions other than the APM Entity's election for the group to participate in MIPS would result in MIPS participation. We

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

believe that this default minimizes the possibility of unexpected participation in MIPS and also recognizes that most APM Entity groups in this situation would be scored collectively under the APM scoring standard in MIPS, thus necessitating group decision-making.

For situations in which an eligible clinician is determined to be a Partial QP individually, we will use the eligible clinician's actual reporting activity to determine whether to exclude the Partial QP from MIPS in the absence of an explicit election. Therefore, if an eligible clinician determined as an individual to be Partial QP submits information to MIPS (which does not include information automatically populated or calculated by CMS on the Partial QP's behalf), we will consider the Partial QP to have reported and thus be participating in MIPS. Likewise, if an eligible clinician determined as an individual to be a Partial QP does not take any action to submit information to MIPS, then we will consider the Partial QP to have elected to be excluded from MIPS.

We anticipate that there will be relatively few Partial QPs, especially in the first few years of the Quality Payment Program; therefore, we believe that this finalized policy will reduce administrative burden on Advanced APM participants and operate most smoothly with our finalized policies for QP determinations.

#### d. Notification of QP Determination

We proposed to notify both Advanced APM Entities and their participating eligible clinicians of their QP or Partial QP status as soon as we have made the determination and performed all necessary validation of the results. We proposed that this notification would be made directly to the Advanced APM Entity and eligible clinician, and made in combination with a general public notice on the CMS Web site that such determinations have been completed for the applicable QP Performance Period. We proposed that this notification would also contain other necessary and useful information, such as what actions, if any, an Advanced APM Entity or

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

eligible clinician may or should take with respect to MIPS.

We solicited comment on our proposals to make the QP and Partial QP status notifications. We also solicited comment on other methods and media for the notification of QP and Partial QP status. We also solicited comment on the content of such notifications so that they may be as clear and useful as possible.

The following is a summary of the comments we received regarding our proposal to make notifications regarding the results of QP and Partial QP determinations.

Comment: Many commenters suggested that CMS notify Advanced APM participants of their QP status as soon as possible so that they can know whether or not they should report to MIPS. Several commenters specifically stated that notification should be made during the QP Performance Period or by February 1 or March 1 of the year following the QP Performance Period.

Response: We agree that timely notification is important, and we understand that much of the concern for receiving timely notifications is related primarily to the QP Performance Period timeframe. We can only notify Advanced APM participants of their QP status as soon as such status is finalized, and as proposed, that notification could not have occurred prior to April or May of the year following the QP Performance Period. However, under the finalized QP determination timeframe, we will be able to complete QP determinations at three separate times during the QP Performance Period, thus enabling significantly earlier notifications than proposed.

Comment: Several commenters stated the need for clear communication and offered suggestions on the types of content that should be contained in the notifications. Some commenters recommended that we provide Advanced APM participants with comprehensive information on their Threshold Scores using both the payment amount and patient count methods

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

so that they can see precisely where they stand in relation to the QP thresholds. Other commenters stated that we should send preliminary information to Advanced APM participants before the actual QP determinations so that they can predict their QP status. Finally, some commenters requested that we send reports with data sufficient for Advanced APM Entities to replicate and verify the Threshold Score calculations. Finally, one commenter requested that we include an appeals process following notification of the QP determinations.

Response: We agree that supplying useful information about Threshold Scores under the different methods in concert with the QP determination is a valuable goal. We will take all of these comments into account as we develop the notification format and content. We also plan to supply Advanced APM participants with preliminary analyses based on their historical claims to help them understand their likelihood of meeting the QP thresholds were they to practice in the Advanced APM similarly to how they have done previously. Finally, section 1833(z)(4) of the Act explicitly excludes administrative or judicial review of the QP determinations, but we will ensure that the calculations undergo a rigorous quality assurance process prior to finalization.

Comment: Some commenters provided suggestions as to which parties should receive notifications of QP status. One commenter suggested that we send notifications to the Advanced APM Entity and the eligible clinicians in writing or via email and that we publicly post the determinations on the CMS website. One commenter stated that the Advanced APM Entity should receive the notification instead of TINs that may be part of the Advanced APM Entity.

Response: We thank the commenters for their suggestions, and we agree that it is important to ensure that the appropriate parties are properly notified of their status. We will take these comments into consideration when developing our notification processes.

We are finalizing the proposal to notify Advanced APM Entities and eligible clinicians of their QP or Partial QP status as soon as we have made the determination and performed all

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

necessary validation of the results. This notification process will occur for each of the three QP determinations that we will perform during a QP Performance Period. We will provide additional information on the format of such notifications and the data we will include as part of our public communications following this final rule with comment period.

## 6. Qualifying APM Participant Determination: Medicare Option

### a. In General

Under the Medicare Option, we proposed to calculate a Threshold Score for an Advanced APM Entity—or eligible clinician in the cases of an exception described in section II.F.5.b. of the proposed rule (81 FR 28319)—based on participation in an Advanced APM by analyzing claims for Medicare Part B covered professional services. Under the alternative calculation using patient counts in lieu of payments (patient count method), we proposed to similarly calculate a Threshold Score for the Advanced APM Entity based on patient attribution as described in the proposed rule. Under either the payment amount or patient count method, only Medicare Part B covered professional services under the PFS will count toward the numerator and denominator of the Threshold Score calculation.

Section 1833(z)(2)(A), (B)(i) and (C)(i) of the Act describes the QP determination using the Medicare payment method as follows: A QP is an eligible clinician whose payments under this part for covered professional services furnished by such professional during the most recent period for which data are available (which may be less than a year) were attributable to such services furnished under this part through an Advanced APM Entity. Section 1833(z)(2)(D) of the Act describes the basis for the patient count method.

#### (1) Attributed Beneficiaries

In section II.F.3. of the proposed rule (81 FR 28295), we proposed two definitions that would apply specifically for the purposes of QP determination: attributed beneficiary and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

attribution-eligible beneficiary. Each term describes a particular relationship between an Advanced APM Entity and the beneficiaries for whose cost and quality of care the participating eligible clinicians are held accountable. These terms are the foundation for how we propose to count services furnished through an Advanced APM Entity.

We proposed that “attributed beneficiary” be defined as a beneficiary attributed to the Advanced APM Entity on the latest available list of attributed beneficiaries during the QP Performance Period based on each APM’s respective attribution rules. There are some natural advantages to using this term for the purposes of QP determination because it is consistent with how many APMs—including the Shared Savings Program (assigned beneficiaries), Next Generation ACO Model (aligned beneficiaries), and BPCI Model (attributed beneficiaries)—identify the beneficiaries whose outcomes and costs are included in an APM Entity’s assessment. We believe that using the same construct also coordinates the incentives under the Advanced APM with the incentives under the MACRA by addressing the same beneficiary population.

In most episode payment models, such as the CJR Model, attribution is defined by the beneficiaries who trigger the defined episode of care under the model, often by presenting with a specific condition at the location of a participating APM Entity. In many attribution-based APMs, such as ACO initiatives or the Comprehensive Primary Care Initiative, CMS attributes beneficiaries to APM Entities through claims-based algorithms that identify the APM Entity with the plurality of evaluation and management visits for a beneficiary. In addition, most APMs do not allow beneficiaries to be attributed to more than one APM Entity. This means that the greater the APM Entity density in a market, the lower the attributed population for a given APM Entity will be as a percent of its total beneficiaries. We solicited comment on the proposed methodology for defining the attributed beneficiary population, including comment on alternative methods for capturing the most meaningful cohort of attributed beneficiaries.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Under these plurality-based approaches, typically only 30-50 percent of an Advanced APM Entity's total population of beneficiaries for whom its eligible clinicians furnish services are actually attributed to the Advanced APM Entity for a performance period. These percentages reflect a combination of CMS' design decisions, beneficiaries' underlying care patterns, and the fact that beneficiaries in Medicare FFS retain freedom of choice to select clinicians. These percentages reflect conditions that are not entirely under the control of the APM Entity or its eligible clinicians. Thus, we recognize that because Advanced APMs have different attribution methodologies, using the specific Advanced APM attributed beneficiary as the definition may create a standard that advantages or disadvantages participation in certain Advanced APMs relative to others simply based on the specific attribution policies.

We proposed to use the attributed beneficiaries on Advanced APM attribution lists generated by each Advanced APM in making QP determinations. We also proposed that the attributed beneficiary list would be taken from the Advanced APM's latest available list at the end of the QP Performance Period prior to making the QP determinations. For episode payment models, attributed beneficiaries would be those beneficiaries who trigger episodes of care under the terms of the APM.

We believe that this approach to attribution lists maintains consistency with the panel of beneficiaries for whom Advanced APM Entities are responsible under their respective Advanced APMs during the QP Performance Period. Therefore, we believe that such lists would be appropriate for use in QP determinations. Advanced APM Entities are already accustomed to providing care for the panel of beneficiaries represented by their APM Entity-specific list. We believe that our proposal to link attribution for QP determination to Advanced APM attribution lists further strengthens the goals of the Advanced APMs in which these Advanced APM Entities participate. By using the same beneficiary population for QP determination purposes, Advanced

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM Entities may continue focusing on the care they furnish to the same panel of attributed beneficiaries, instead of shifting focus and changing practice patterns to reach a QP threshold. As stated in our principles in section II.F.1. of the proposed rule (81 FR 28293), we intend for the QP determination process to seamlessly reward participation in Advanced APMs, not to create a new set of performance standards distinct from the goals of APMs.

We solicited comment on our proposal for determining which beneficiaries are considered attributed to an Advanced APM Entity.

The following is a summary of the comments we received regarding our proposal to define the attributed beneficiary population based on actual Advanced APM attribution and to use the latest available attribution list at the end of the QP Performance Period for QP determinations.

Comment: We received several comments related to attribution more generally, such as how to improve attribution in APMs, enable attribution across multiple entities or APMs, allow for review and modification of attribution lists, and requests for clarification of how attribution is performed in APMs.

Response: We thank the commenters for their input. However, these issues are beyond the scope of this final rule with comment period.

We are finalizing the definition of attributed beneficiary as proposed. We are finalizing that we would identify the attributed beneficiaries for an Advanced APM Entity based on the latest available attribution list at the time of a QP determination. This differs slightly from the proposed policy in order to align with the finalized QP Performance Period policies in this section and enable QP determinations to be made earlier in the QP Performance Period.

## (2) Attribution-Eligible Beneficiaries

Consistent with our proposed definition of attributed beneficiary, our proposed definition

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for an attribution-eligible beneficiary would allow us to be consistent across Advanced APMs in how we consider the population of beneficiaries served by an Advanced APM Entity for the purposes of QP determination. To be attributed to an Advanced APM Entity in an Advanced APM, a beneficiary is first required to meet certain eligibility criteria. Specifically, for purposes of QP determinations, we propose that an attribution-eligible beneficiary would be one who:

- (1) Is not enrolled in Medicare Advantage or a Medicare cost plan.
- (2) Does not have Medicare as a secondary payer.
- (3) Is enrolled in both Medicare Parts A and B.
- (4) Is at least 18 years of age.
- (5) Is a United States resident.
- (6) Has a minimum of one claim for evaluation and management services by an eligible

clinician or group of eligible clinicians within an APM Entity for any period during the QP Performance Period.

An attribution-eligible beneficiary may or may not be an attributed beneficiary.

Attributed beneficiaries are a subset of attribution-eligible beneficiaries. Much like the term “attributed beneficiary,” the term attribution-eligible beneficiary is generally consistent with the attribution methodologies used in most current APMs to identify the beneficiaries who could potentially be attributed to an APM Entity. Although the factors we proposed for the definition of an attribution-eligible beneficiary in this context would only apply for the purposes of QP determinations, and would not change APM-specific methodologies, we believe that the factors in the proposed definition are representative of the methodologies most current APMs use to perform attribution. Therefore, we believe it would serve as a practical common set to apply in QP threshold calculations.

The purpose of using the attribution-eligible construct is to ensure that the denominator

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

of QP determination calculations described in this section only includes payments for services furnished to patients who could potentially be attributed to an Advanced APM Entity under the Advanced APM, and thus could also appear in the numerator of the QP determination calculations. We believe that including amounts in the denominator that could not possibly be included in the numerator would be arbitrarily punitive toward certain Advanced APM Entities that furnish services to a substantial population of non-attribution-eligible beneficiaries.

We note that specialty-focused or disease-specific APMs may have attribution methodologies that are not based on evaluation and management services. Therefore, we anticipate needing targeted exceptions, especially related to the sixth factor of the definition of attribution-eligible beneficiary, for such APMs so that the attributed beneficiary population is truly a subset of the attribution-eligible population. Such exceptions would be made either through rulemaking or using available waiver authority and would be announced when the APM is announced.

For example, under the CEC Model, one criterion, among others, to be an aligned beneficiary requires that the beneficiary receive maintenance dialysis services. In the event that the CEC Model were determined to be an Advanced APM, we would consider attribution-eligible beneficiaries for the APM Entities participating in the CEC Model to be beneficiaries that meet the first five criteria outlined above and that have had at least one maintenance dialysis service billed through the Advanced APM Entity during the QP Performance Period. We would make this exception for the CEC Model to ensure that the denominator of QP determination calculations described in this section only includes payments for services furnished to patients who could potentially be attributed to an Advanced APM Entity under the Advanced APM.

Although the availability of such exceptions, as outlined above, would create multiple standards for the beneficiaries that are attribution-eligible, we believe this slightly more complex

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

approach is more appropriate and equitable because it is consistent with the design of APMs. An alternative approach could be to have a simple standard that includes in the denominator all beneficiaries who are furnished any Medicare Part B covered professional service by eligible clinicians participating in the Advanced APM Entity.

We solicited comment on the proposed general definition of attribution-eligible beneficiary and on our proposal to use of APM-specific standards as necessary to fulfill our expressed goals for specialty- or disease-focused APMs that may use alternative attribution methodologies.

The following is a summary of the comments we received regarding our proposal to define attribution-eligible beneficiaries.

Comment: Many commenters stated support for altering the definition of attribution-eligible in circumstances when an Advanced APM does not base attribution on evaluation and management services in order to support disease- and specialty-focused APMs, such as BPCI, CJR, OCM, and CEC, with the assumption that these APMs would be Advanced APM. Some commenters requested that we explain how such exceptions will be made and that stakeholders have input in defining the rules.

Response: We do not believe that there should be a formal application process for these exceptions because we operate both the Quality Payment Program and Advanced APMs. Therefore, we will make assessments appropriate to the interactions between programs. As we explained, we would for the CEC Model, consider whether the evaluation and management service basis for the definition of attribution-eligible beneficiary is appropriate for assessing eligible clinicians' participation in an Advanced APM. If evaluation and management services are significantly at odds with actual attribution and the evaluation of performance on the cost and quality of beneficiary care under an Advanced APM, we may consider a different basis for the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

attribution-eligible beneficiary definition that takes into consideration attribution within the Advanced APM. In that case, we would make an exception either through rulemaking or by using available waiver authority that would be announced in connection with notifications for the APM.

Comment: In direct response to our solicitation on defining attribution-eligible beneficiaries in the context of the CEC initiative, several commenters suggested that only patients on dialysis be included in the attribution-eligible definition, which would exclude those patients with CKD or a kidney transplant unless and until the CEC initiative expands to include responsibility for CKD or kidney transplant patients.

Response: We appreciate the detailed input commenters offered in response to our solicitation regarding the CEC initiative and agree that these are important components to appropriately defining the attribution-eligible population. We will take these responses into account as needed to develop the basis for attribution-eligible beneficiaries for CEC.

We are finalizing the definition of attribution-eligible to mean a beneficiary who:

- Is not enrolled in Medicare Advantage or a Medicare cost plan.
- Does not have Medicare as a secondary payer.
- Is enrolled in both Medicare Parts A and B.
- Is at least 18 years of age.
- Is a United States resident.
- Has a minimum of one claim for evaluation and management services by an eligible

clinician or group of eligible clinicians within an APM Entity for any period during the QP Performance Period.

We are also finalizing that, for Advanced APMs that do not base attribution on evaluation and management services and for which attributed beneficiaries are not, in fact, a subset the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

attribution-eligible beneficiary population based on the requirement to have at least one claim for evaluation and management services furnished by an eligible clinician who is in the APM Entity for any period during the QP Performance Period, then we will modify the definition of attribution-eligible beneficiary for that Advanced APM only in order to identify the appropriate attribution-eligible population based upon the attribution methodology of the Advanced APM (for example, a combination of evaluation and management services and/or other Part B covered professional services). We will announce these exceptions to the extent applicable in a manner consistent with the Advanced APM notification process under section II.F.4. of this final rule with comment period.

For example, we would develop such an exception for the CEC Model to the extent it is determined to be an Advanced APM to ensure that the denominator of QP determination calculations described in this section only includes payments for services furnished to patients who could potentially be attributed to ESRD Seamless Care Organizations (ESCOs).

#### b. Payment Amount Method

This section describes how we will calculate a Threshold Score for the eligible clinician group in an Advanced APM Entity—or individual eligible clinician in the exception situations under section II.F.6. of this final rule with comment period—using the payment amount method, which would then be compared to the relevant QP Payment Amount Threshold and Partial QP Payment Amount Threshold to determine if the eligible clinician meets the QP status for a payment year.

##### (1) Claims Methodology and Adjustments

For the payment amount method, sections 1833(z)(2)(A), (B)(i) and (C)(i) of the Act requires that we use payments for Medicare Part B covered professional services to make QP determinations. Covered professional services are defined under section 1848(k)(3)(A) of the Act

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

as services for which payment is made under, or based on, the PFS. The payment amounts discussed in this proposal only include payments for Medicare Part B services under, or based on, the PFS, even if an Advanced APM bases attribution and/or financial risk on payments other than or in addition to Medicare Part B payments.

We proposed to use all available Medicare Part B claims information generated during the QP Performance Period. Additionally, we propose that CMS will treat claims run-out, claims adjustments, supplemental service payments, and alternative payment methods in the same manner for purposes of calculating both the Threshold Score and for determining the APM Incentive Payment amount. We further detailed our proposals to account for claims run-out, claims adjustments, non-claims-based payments, and alternative payment methods in section II.F.8. of the proposed rule (81 FR 28339).

We believe it is appropriate to maintain consistency across the QP determination and the incentive payment calculation in order to support internal CMS operational consistencies. It also ensures that any unique payment mechanisms within an Advanced APM do not affect the opportunity for an eligible clinician to reach the QP threshold.

We solicited comment on whether the claims methodology we use under the Medicare payment method should align with the proposed claims methodology for purposes of calculating the estimated aggregate payment amount for the APM Incentive Payment.

The following is a summary of the comments we received regarding our proposal for the QP payment amount method to use all available claims information for Medicare Part B covered professional services during the QP Performance Period and to treat claims run-out, claims adjustments, supplemental service payments, and alternative payment methods in the same manner as that used for the APM Incentive Payment calculation.

Comment: Several commenters expressed general support for the QP determination

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

methodologies in this section, including our interpretation of which payments and patients are considered “through” an Advanced APM and that we will use the same treatment of claims for calculating the Threshold Scores in this section and the APM Incentive Payment in section II.F.8. of this final rule with comment period.

Response: We thank the commenters for their support of our approach to QP determination methodologies.

Comment: Some commenters were uncertain about how “incident to” items and services would be considered in QP calculations.

Response: We would consider “incident to” billing for covered professional services to be covered professional services when calculating the Threshold Scores, as long as the NPI billing for the “incident to” claims is identified as a participant in the Advanced APM Entity. We further clarify that this would exclude “incident to” payment for drugs, biologics, and devices covered under Medicare Part B because those are not covered professional services.

Comment: One commenter requested that we use the Medicare paid amount instead of the allowed amount when calculating the Threshold Score.

Response: We do not believe it would be appropriate to use the Medicare paid amount instead of the allowed amount when calculating Threshold Scores. The Medicare paid amount reflects any reductions from the Medicare PFS amount for beneficiary co-payments or coinsurance requirements, and also reflects any payment adjustments that are applied to fee schedule payments, such as positive or negative payment adjustments from the PQRS, MU, VM, or MIPS programs. Including these adjustments is inconsistent with our proposal to exclude payment adjustments from these programs that we finalized in section II.F.8. of this final rule with comment period.

We are finalizing that for the QP payment amount method we will use all available

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

claims information for Medicare Part B covered professional services during the applicable QP determination period as described in this section of the final rule with comment period.

## (2) Threshold Score Calculation

In general, our method for deriving a Threshold Score for an Advanced APM Entity is to divide the value described under paragraph (a) in this section by the value described under paragraph (b) of this section. This calculation will result in a percent value that CMS will compare to the QP Payment Amount Threshold and the Partial QP Payment Amount Threshold to determine the QP status for all eligible clinicians in the Advanced APM Entity for the payment year.

### (a) Numerator

We proposed that the numerator for this calculation would be the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attributed beneficiaries during the QP Performance Period.

We believe that this method is the most logical reading of the statute and is reflective of the population of beneficiaries for whom an Advanced APM Entity is responsible for cost and quality. Therefore, we believe that counting payments for covered professional services furnished to attributed beneficiaries is the most suitable metric for payments that are attributable to services furnished “through” an Advanced APM Entity. In episode payment models, because a beneficiary is considered attributed during the course of an episode, the payments included in the numerator for this calculation are those for Medicare Part B covered professional services furnished to an attributed beneficiary by eligible clinicians in the Advanced APM Entity during the course of an episode.

One program integrity concern is that an Advanced APM Entity might meet the higher QP Payment Amount Threshold in later years by providing substantially disproportionate

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

amounts of care for attributed beneficiaries relative to all others. However, because of the financial risk an Advanced APM Entity bears, which is usually based on expenditures, we believe that the relatively large potential loss under the Advanced APM would outweigh the advantage of any overutilization geared toward abusing Threshold Score calculations.

We solicited comment on any alternative numerators we could use for purposes of the Medicare payment method that meaningfully meet statutory requirements, are understandable, and operationally feasible.

The following is a summary of the comments we received regarding our proposal to calculate the numerator of the Threshold Score under the QP payment amount method using the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attributed beneficiaries during the QP Performance Period.

Comment: We received few comments regarding the numerators for QP determinations, but most commenters were generally supportive of its basis in services furnished to an Advanced APM Entity's attributed beneficiary population. One commenter suggested that we essentially include all physician payments in the numerator for which a physician is listed as an attending physician because the commenter stated that hospitalists are ultimately responsible for all spending for a patient.

Response: We thank the commenters for their general support of our approach. We do not believe it is meaningful or consistent with the statute to design numerators that are mathematically the same as, or potentially larger than, denominators. Although we understand that Advanced APM participation may have valuable spillover effects into other aspects of clinical practice, we must base the calculations in terms of direct Advanced APM participation, not any activity that appears similar in nature to Advanced APM activity.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are finalizing the numerator of the Threshold Score under the QP payment amount method to be the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attributed beneficiaries during the timeframe used for QP determination.

This is identical to the proposed policy except that the applicable range of service dates will vary depending on which of the three QP determinations during a QP Performance Period is being performed in accordance with the finalized QP Performance Period policy in this section and illustrated in Figure G.

(b) Denominator

We proposed that the denominator in the Medicare payment method would be the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attribution-eligible beneficiaries during the QP Performance Period. We proposed that when the QP determination is made at the eligible clinician level as described in section II.F.5. of the proposed rule (81 FR 28313), the denominator would be the total of all payments for Medicare Part B covered professional services furnished to attribution-eligible beneficiaries by the eligible clinician. In episode payment models, the payments included in the denominator for this calculation as proposed would be those for Medicare Part B covered professional services furnished to any attribution-eligible beneficiary by eligible clinicians in the Advanced APM Entity. This would include all such services to all attribution-eligible beneficiaries whether or not such services occur during the course of an episode under the Advanced APM.

Including payment for services furnished only to attribution-eligible beneficiaries standardizes the denominator to ensure fairness across types of eligible clinicians and geographic regions. By using the attribution-eligible population, the denominator will not penalize entities

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for furnishing services to beneficiaries who could not possibly be in the numerator through attribution under an Advanced APM. For example, an ACO's eligible clinicians may furnish services to a large population of beneficiaries with Medicare as a secondary payer. Those beneficiaries may not be eligible for attribution to the ACO, and could never be included in the numerator. Therefore, we believe that this methodology focuses on factors for which Advanced APM Entities have some control rather than those for which they may have no control or that disadvantage certain organizational structures or types of APMs. We solicited comment on alternative methods that are consistent with the statutory language.

The following is a summary of the comments we received regarding our proposal to calculate the denominator of the Threshold Score for the QP payment amount method using the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attribution-eligible beneficiaries during the QP Performance Period.

Comment: Several commenters expressed support for the basis of the denominator being tied to attribution-eligible beneficiaries because it meaningfully limits the denominator to those beneficiaries that could potentially be in the numerator. Some commenters recommended that we consider adjusting the denominator to ensure that episodes are treated appropriately in the numerator and the denominator. For instance, one commenter suggested that the last element of the attribution-eligible definition be tied to all beneficiaries with the specific disease, condition, or episode to whom the Advanced APM Entity eligible clinicians furnished services for Medicare Part B covered professional services.

Response: We thank the commenters for their support and agree that the attribution-eligible construct is a meaningful way to define the denominator. We also believe that evaluation and management services remain a consistent standard that identifies the population of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

beneficiaries whom eligible clinicians can consider their patients, even though some APMs base attribution on services other than evaluation and management services. The narrow focus of some APMs, primarily episode payment models, may make it relatively difficult for participants to reach the QP thresholds in comparison to APMs that are based upon a more comprehensive assessment of beneficiary care. Nonetheless, we believe that the QP thresholds will still be attainable by episode payment model participants who have a significant portion of their practice focused on the services upon which the APM is based. Customizing the denominator to the particular services upon which an APM is focused could, in many cases, reduce the denominator so much that it would not be meaningfully representative of an eligible clinician's business under Medicare Part B. Under such an approach, the 5 percent APM Incentive Payment, which is based on an eligible clinician's payments for Part B covered professional services, could exceed the entire denominator value in many cases. Therefore, we continue to believe that the proposed policy as applied to episode payment models is appropriate and representative of an eligible clinician's degree of Part B-related participation in an Advanced APM.

Comment: A few commenters expressed concern that the denominator will be difficult for APM participants to estimate, thus causing uncertainty about their likely QP status. Most APMs currently provide APM Entities only with an attributed beneficiary list, not an attribution-eligible beneficiary list.

Response: We appreciate the feedback on the inability to precisely predict an Advanced APM Entity's Threshold Score because this is a new calculation without historical scores or readily available information on beneficiaries considered attribution-eligible. Each APM manages the beneficiary attribution rules and lists provided to participants. However, we believe that the preliminary Threshold Score information we plan to send to Advanced APM participants near the beginning of a QP Performance Period will mitigate these concerns. We welcome input

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

for the future on particular types of data that Advanced APM participants would find helpful in their analyses.

Comment: Several commenters expressed concern about the potential difficulty of attaining high Threshold Scores based on the proposed denominator. In particular, commenters cited specialists, who in most cases may participate in only one ACO but often see a broad range of patients across many networks, most of whom are not attributed to the specialist's particular ACO. Commenters stated that this could result in a dilution of the denominator and be detrimental to the entire APM Entity's ability to meet the higher QP thresholds, creating an inadvertent incentive to remove specialists from Participation Lists in the future. Some commenters requested that we find a way other than attribution to define the denominator or to separately evaluate non-primary care practitioners so that the relative breadth of their practices is not a detriment to the Threshold Score. One commenter suggested that we extend the QP threshold increases so that the higher thresholds are further in the future. One commenter stated that it is unfair to have a metric for which attaining a 100 percent score is often not possible, particularly for specialty practice groups. Another commenter suggested that we simply use attributed beneficiaries in the denominator instead of attribution-eligible beneficiaries, acknowledging that this would essentially give a 100 percent score to all Advanced APM Entities. Some commenters suggested that we exclude from attribution-eligible category any beneficiaries who are actually attributed to other Advanced APM Entities in order to address the issue of attribution competition over beneficiaries in regions with a high density of Advanced APM Entities. Finally, some commenters recommended that we include service area adjustments to account for mobile beneficiary populations that may only reside in an area for a portion of a year.

Response: We understand the commenters' concerns about the denominator being a key

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

factor in reaching the higher QP thresholds. We agree and have developed the attribution-eligible definition in response to otherwise unrealistic thresholds for many organizations. That said, we do not believe it is necessary to make a 100 percent Threshold Score attainable to all Advanced APM participants because this is, as the name implies, a metric based on reaching a threshold. Once the threshold is met, no additional benefit accrues to those with higher Threshold Scores. With respect to the suggestion of removing beneficiaries attributed to other Advanced APM Entities from the denominator, we appreciate the idea and agree that it would have the effect of shrinking the denominator. However, we believe it is important to provide an incentive for Advanced APM Entities to strive to expand their attributed population. It is consistent with our goals that, within their capabilities, Advanced APM Entities are responsible for the cost and quality of as many beneficiaries as possible. With respect to service area adjustments, we believe that this would add a high degree of complexity to this calculation with very minimal positive impact on Threshold Scores.

We will closely monitor Threshold Scores, particularly with respect to the impact of specialist participation, the fragmentation of where beneficiaries seek their care, or circumstances such as high rates of “snowbird” patients affecting the denominator. We will monitor Threshold Scores at both the APM Entity and individual levels to understand how group Threshold Scores may vary based on characteristics of attributed beneficiary populations and the eligible clinicians in an Advanced APM Entity.

We believe that ACOs, which on average have specialist representation on their Participation Lists approximately representative of the specialist distribution nationally, will generally be able to meet the QP thresholds. We also believe that participation in any episode payment models that are Advanced APMs could be an opportunity, consistent with the relatively narrow scope of many episode payment models, for eligible clinicians to become a QP.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Comment: A few commenters believe that the attribution-eligible construct for the denominator could inadvertently create an incentive to not provide necessary services or to select patients for purposes of meeting the QP thresholds.

Response: We appreciate the consideration for program integrity concerns. We take these concerns seriously, and, as described in section II.F.9. of this final rule with comment period, we will be monitoring the program for patterns of behavior with unintended negative consequences.

We are finalizing the denominator of the Threshold Score under the QP payment amount method to be the aggregate of all payments for Medicare Part B covered professional services furnished by the eligible clinicians in the Advanced APM Entity to attribution-eligible beneficiaries during the timeframe used for QP determination. This is identical to the proposed policy except that the applicable range of service dates will vary depending on which of the three QP determinations during a QP Performance Period is being performed in accordance with the finalized QP Performance Period policy in this section.

#### c. Patient Count Method

Similar to the Medicare payment amount method, this section describes our proposal for calculating a Threshold Score for the eligible clinicians participating in an Advanced APM Entity—or eligible clinician in situations under section II.F.6. of this final rule with comment period—using the Medicare patient count method, which would then be compared against the relevant QP Patient Count Threshold and Partial QP Patient Count Threshold to determine the QP status of an eligible clinician for the year. Given our authority under section 1833(z)(2)(D) of the Act to use patient counts in lieu of payments “as the Secretary determines appropriate,” we are interpreting the patient count method to offer a more flexible alternative to the payment method. As previously mentioned, the purpose of the proposed design of the Medicare patient count method is to make QP status determinations accessible to entities and individuals who are

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

clearly and significantly engaged in delivering value-based care through participation in

Advanced APMs.

#### (1) Unique Beneficiaries

We proposed that when counting the number of beneficiaries under this method, we may count a given beneficiary in the numerator and denominator for multiple different Advanced APM Entities or eligible clinicians.

We proposed that we would not count any beneficiary more than once for any single Advanced APM Entity or eligible clinician. In other words, for each Advanced APM Entity or eligible clinicians, we would count each unique beneficiary no more than one time in the numerator and one time in the denominator.

We believe that counting beneficiaries this way retains the integrity of the Threshold Scores by preventing double counting of beneficiaries within an Advanced APM Entity while recognizing the reality that beneficiaries often have relationships with multiple different organizations.

To be consistent with the Medicare payment method, we proposed that beneficiary counts would be based on any beneficiary for whom the eligible clinicians within an Advanced APM Entity receive payments for Part B covered professional services, or professional services furnished at an RHC or FQHC as described in this section, even if an Advanced APM bases its attribution and/or financial risk on both Parts A and B. We proposed that for this Threshold Score calculation, we would use any and all available Part B claims information generated during the QP Performance Period. We received no specific comments regarding our proposals to enable a beneficiary to be counted for multiple APM Entities but to count a beneficiary no more than once per APM Entity.

We are finalizing the policy for the Medicare patient count method to enable a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

beneficiary to be counted in the numerator and denominator for multiple APM Entities or eligible clinicians but to count a beneficiary no more than once in the numerator and once in the denominator per APM Entity or eligible clinician. We are also finalizing the policy to base patient counts on any beneficiary for whom the eligible clinicians within an Advanced APM Entity receive payments for Part B covered professional services, or professional services furnished at an RHC or FQHC as described in this section, and to use any and all available Part B claims information generated during the QP Performance Period.

## (2) Threshold Score Calculation

We proposed that the Threshold Score would be calculated under the Medicare patient count method as a percent by dividing the value described under paragraph (a) of this section by the value described under paragraph (b) of this section. We include the formula and examples in the summary equation below.

### (a) Numerator

We proposed that the numerator would be the number of unique attributed beneficiaries to whom eligible clinicians in the Advanced APM Entity furnish Medicare Part B covered professional services during the QP Performance Period. For episode payment models, this would include the number of attributed beneficiaries furnished Medicare Part B covered professional services, or professional services at an RHC or FQHC as described in this section, by eligible clinicians in the Advanced APM Entity during the course of an episode under the Advanced APM.

We did not receive any comments uniquely responding to our proposal for the numerator in the patient count method that were not also applicable to the payment amount method. Therefore, relevant comments were addressed in the payment amount numerator section.

We are finalizing the policy that the numerator of the Threshold Score for the QP patient

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

count method will be the number of unique attributed beneficiaries to whom eligible clinicians in the Advanced APM Entity furnish Medicare Part B covered professional services, or professional services at an RHC or FQHC as described in this section, during the QP determination timeframe. For episode payment models, the numerator will be the number of attributed beneficiaries furnished Medicare Part B covered professional services by eligible clinicians in the Advanced APM Entity during the course of an episode under the Advanced APM. This policy is identical to the proposed policy except that the applicable range of service dates will vary depending on which of the three QP determinations during a QP Performance Period is being performed in accordance with the finalized QP Performance Period policy in this section.

(b) Denominator

We proposed that the denominator would be the number of attribution-eligible beneficiaries to whom eligible clinicians in the Advanced APM Entity furnish covered professional services during the QP Performance Period. For episode payment models, this would include the number of attribution-eligible beneficiaries furnished Medicare Part B covered professional services by eligible clinicians in the Advanced APM Entity group at any point during the QP Performance Period, irrespective of whether such services occur during the course of an episode.

We solicited comment on alternative approaches to the patient count method that would achieve our goal of a simple and meaningful Threshold Score calculation.

We did not receive any comments uniquely responding to our proposal for the denominator in the patient count method that were not also applicable to the payment amount method. Therefore, relevant comments were addressed in the payment amount denominator section.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We are finalizing the denominator of the Threshold Score under the QP patient count method to be the number of attribution-eligible beneficiaries to whom eligible clinicians in the Advanced APM Entity furnish covered professional services during the timeframe used for QP determination.

This is identical to the proposed policy except that the applicable range of service dates will vary depending on which of the three QP determinations during a QP Performance Period is being performed in accordance with the finalized QP Performance Period policy in this section.

In general, we believe that through consistency with the payment amount method, this approach balances our interests of relative simplicity and having a meaningful standard that recognizes the common aspects of attribution and accountability under Advanced APMs. Similar to the payment amount method, the patient count method represents a proportion of the patients for whom an Advanced APM Entity is accountable under the Advanced APM with respect to all patients who could potentially be attributed to the Advanced APM Entity under the Advanced APM.

### (3) APM Entity Participation in Multiple Advanced APMs

We proposed that if the same Advanced APM Entity participates in multiple Advanced APMs and if at least one of those Advanced APMs is an episode payment model, we would add the number of unique beneficiaries in the numerator of the episode payment model Advanced APM Entity to the numerator(s) for non-episode payment models in which the Advanced APM Entity participates. For example, if an Advanced APM Entity is an ACO in Track 3 of the Shared Savings Program and also in the OCM (assuming these are both Advanced APMs for purposes of this example), we would add the entity's unique attributed beneficiaries in OCM to the numerator for its Shared Savings Program Track 3 Threshold Score calculation. We proposed that for purposes of the APM incentive, Advanced APM Entities would be considered the same

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

if we determine that the eligible clinician Participation Lists are the same or substantially similar, or if the Advanced APM Entity participating in one Advanced APM is the same as, or is a subset of, the other.

The purpose of this proposal was to allow the logical combination of activities under multiple Advanced APMs where appropriate. We believe that the purpose of the incentives for Advanced APM participation is to capture the degree of Advanced APM participation generally, not simply the degree of participation within a single Advanced APM. Where relevant and operationally feasible, we want this program to encourage participation in multiple Advanced APMs. The counterfactual where we would not account for a single Advanced APM Entity's participation in multiple Advanced APMs could be seen as punitive. For instance, an Advanced APM Entity could serve the vast majority of its beneficiaries through several Advanced APMs, but unless that participation is aggregated, the entity could end up with several lower Threshold Scores that are below the QP Patient Count Threshold and not indicative of its broader participation.

We understand the difficulty associated with determining whether two Advanced APM Entities are in fact the same organization. It is highly unlikely that their Participation Lists would be exactly the same. Therefore, we solicited comment on how best to make a determination of substantial similarity, which includes, for example, matching organizational information, aligning TINs, and comparing Participation Lists. We also solicited comment on percentages of Participation List or TIN similarity that would be sufficient for APM Entities to be considered under this policy.

The following is a summary of the comments we received regarding our proposal that if the same Advanced APM Entity participates in multiple Advanced APMs and if at least one of those Advanced APMs is an episode payment model, we would add the number of unique

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

beneficiaries in the numerator of the episode payment model Advanced APM Entity to the numerator(s) for non-episode payment models in which the Advanced APM Entity participates.

Comment: Several commenters supported this proposed policy, and one commenter suggested that we define “substantially similar” so that either of the Advanced APM Entity Participation Lists must have at least a specified percentage of the eligible clinicians participating in the other Advanced APM Entity.

Response: We agree that it would be optimal to have a clear percentage of similarity standard that could apply across all APMs and APM Entities. However, many episode payment models construct Participation Lists or Affiliated Practitioner Lists differently than those in other APMs so the amount by which the individual eligible clinicians overlap is highly variable rates depending upon the entities.

After considering the comments and the difficulty of implementing this policy as proposed, we are not finalizing the proposed policy to combine the numerators of Advanced APM Entities that participate in multiple Advanced APMs with substantially similar Participation Lists. We do not believe that we have a reliable, precise mechanism for determining substantial similarity of Participation Lists. Further, we believe that the policy we finalized earlier in this section regarding how we would assess eligible clinicians who are in multiple Advanced APMs serves the intended purpose of this proposed policy because it gives an eligible clinician the opportunity to become a QP in the event that the eligible clinician does not become a QP through any one of the multiple Advanced APMs in which the eligible clinician participates. Therefore, we do not believe that our reconsideration of this policy will limit the opportunity of eligible clinicians to become QPs, and we believe that not finalizing this policy will promote operational and conceptual simplicity.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We proposed that we would calculate Threshold Scores for eligible clinicians in an Advanced APM Entity under both the payment amount and patient count methods for each QP Performance Period. We also proposed that we would assign QP status using the more advantageous of the Advanced APM Entity's two scores.

We believe that both the payment amount and patient count methods produce valid Threshold Scores, even as there may be cases in which Threshold Scores vary enough that different QP determinations could result depending on which is used. In such an event, we do not believe that prioritizing the Threshold Score using one calculation over the other would yield an appropriate, non-arbitrary result. By using the more advantageous of the Threshold Scores achieved, we hope to promote simplicity in QP determinations and to maximize the number of eligible clinicians that attain QP status each year. We solicited comment on the use of the payment and patient count methods for the Medicare Option.

The following is a summary of the comments we received regarding our proposal to calculate for each Advanced APM Entity of eligible clinician the Threshold Score using both the payment amount and patient count methods and use the more advantageous of the two scores.

Comment: Many commenters expressed support for the use of the patient count method, for not double-counting beneficiaries, and for using the more favorable of the payment amount or patient count methods for each Advanced APM Entity because it reduces potential variations in Threshold Scores across practice patterns, certain specialty types, and the costs of services. Some supportive commenters recommended that we monitor results to potentially take action to ensure year-to-year stability in Threshold Scores. One commenter was concerned that the patient count methodology might be easier to game to meet the QP thresholds and encouraged CMS to consider whether this might create problematic incentives.

Response: As commenters suggest, we will monitor the results of QP determinations to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

see if there are cases of large disparities between the two methods that may indicate gaming.

We are finalizing the policy as proposed. We will calculate Threshold Scores for each Advanced APM Entity or eligible clinician using both the payment amount and patient count methods and apply the more advantageous QP result.

To clarify the meaning of “more advantageous,” we mean that a QP determination takes precedence over a Partial QP determination, which takes precedence over not meeting either threshold. Therefore, if one method results in a QP determination and the other results in a Partial QP determination, we would apply the QP determination and disregard the Partial QP determination. We note that this is distinct from the numerical score, which is not directly comparable across the payment amount and patient count methods due to the different percentage thresholds for the respective methods. A lower numerical patient count Threshold Score may actually result in a more advantageous QP result than a relatively higher numerical payment amount Threshold Score.

e. Services Furnished Through CAHs, FQHCs, and RHCs

(1) Critical Access Hospitals (CAHs)

We proposed that professional services billed by CAHs under section 1834(g)(2)(B) of the Act (Method II CAH professional services) would count towards the QP determination threshold calculations for both the Medicare payment amount and patient count methods in both the numerator and the denominator, as applicable. These services would constitute “covered professional services” under section 1848(k)(3) of the Act because they are furnished by an eligible clinician and payment is based on the Medicare PFS. This policy is consistent with our treatment of payments for Method II CAH professional services for purposes of the EHR Incentive Program and PQRS adjustments under sections 1848(a)(7) and (8) of the Act, respectively. Under section 1848(a)(7) and (8) of the Act, the PQRS and EHR Incentive Program

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

adjustments are applied to payments for covered professional services furnished by an eligible clinician in a Method II CAH.

CAHs were established under the Balanced Budget Act (BBA) of 1997 as a separate provider type with a distinct set of Medicare Conditions of Participation and their own payment methodology. CAHs are not subject to the Medicare Inpatient Prospective Payment System (IPPS) or the Medicare Outpatient Prospective Payment System (OPPS). Instead, CAHs are generally paid based on 101 percent of reasonable costs for inpatient services and are paid for outpatient services under one of two methods: the Standard Payment method outlined in section 1834(g)(1) of the Act (Method I), or the Optional Payment Method outlined in section 1834(g)(2) of the Act (Method II). A CAH is paid under Method I unless it elects to be paid under Method II.

Under Method I, for cost reporting periods beginning on or after January 1, 2004, payments to CAHs are made for outpatient CAH facility services at 101 percent of reasonable costs. Physicians and practitioners receive payment for professional services under the Medicare PFS. A CAH may elect Method II billing, under which the CAH bills Medicare for both facility services and professional services furnished to its outpatients by a physician or practitioner who has reassigned his or her billing rights to the CAH. Even if a CAH makes this election, each physician or practitioner who furnishes professional services to CAH outpatients can choose to either: (1) reassign his or her billing rights to the CAH, agree to be included under the Method II billing, attest in writing that he or she will not bill Medicare for professional services furnished in the CAH outpatient department, and receive payment from the CAH for the professional services; or (2) elect to file claims for his or her professional services with Medicare for standard payment under the Medicare PFS.

As of January 1, 2004, payment for a physician's professional services provided at a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

CAH billing under Method II is 115 percent of the allowed amount, after applicable deductions, under the Medicare PFS. For a non-physician practitioner's professional services, the payment amount is 115 percent of the amount that otherwise would be paid for the practitioner's professional services, after applicable deductions, under the Medicare PFS.

## (2) Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

RHCs and FQHCs are facilities that furnish services that are typically furnished in an outpatient clinic setting. They are located in areas that have been designated as underserved or health professional shortage areas (HPSAs), and meet other requirements.

Under section 1833(a)(3) of the Act, RHCs are paid an all-inclusive rate (AIR) based on reasonable costs, subject under section 1833(f) of the Act to a maximum payment per visit that is established by Congress and updated annually based on the percentage change in the Medicare Economic Index (MEI) and subject to annual reconciliation. The per-visit limit does not apply to RHCs determined to be an integral and subordinate part of a hospital with fewer than 50 beds. Laboratory tests (excluding venipuncture) and technical components of RHC services are paid separately. The RHC payment limit per visit for CY 2016 is \$81.32, effective January 1, 2016, through December 31, 2016.

The FQHC Medicare benefit was added when section 1861(aa) of the Act was amended by section 4161 of the Omnibus Budget Reconciliation Act of 1990. FQHCs are paid according to the FQHC PPS set out under section 1834(o) of the Act, in which Medicare pays a national encounter-based rate per beneficiary per day, with some adjustments. The unadjusted 2016 PPS rate is \$160.60.

We proposed that professional services furnished at RHCs and FQHCs that participate in ACOs, and are reimbursed under the RHC AIR or FQHC PPS (respectively), be counted towards the QP determination calculations under the patient count method but not under the payment

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

amount method.

In certain Medicare ACO APMs, RHC and FQHC services can be counted for purposes of attributing beneficiaries to an ACO. Therefore, we proposed to include beneficiaries attributed to an Advanced APM Entity in full or in part because of services furnished by RHCs or FQHCs in the patient counts used for QP determination calculations.

As previously stated, section 1833(z)(2)(D) of the Act permits us to use patient counts in lieu of payments when determining whether an eligible clinician is a QP “as the Secretary determines appropriate.” Our proposal to include the professional services furnished by eligible clinicians at RHCs and FQHCs in the QP threshold calculations for the patient count method is essential to assure consistency with this program and existing APM attribution methodologies. An Advanced APM Entity is responsible for the cost and quality of care for all beneficiaries attributed to an APM Entity, including all professional services furnished to such beneficiaries, regardless of whether or not attribution was based on services furnished by an eligible clinician or by an RHC or FQHC. We believe such beneficiaries are clearly served through the Advanced APM Entity, and it would be potentially confusing to eligible clinicians and Advanced APM Entities to track this distinction strictly for purposes of QP determination. We also believe that it would be unduly burdensome and impractical for us to develop and maintain a separate list of beneficiaries aligned to each Advanced APM Entity from the full list of beneficiaries for whom an Advanced APM Entity is responsible under an Advanced APM.

Because professional services furnished by eligible clinicians at RHCs and FQHCs are not reimbursed under, or based on, the Medicare PFS, professional services furnished in these settings do not constitute “covered professional services” under section 1848(k)(3)(A) of the Act. In the Medicare Payment Amount Method, where payments for specified covered professional services are summed, only payments for covered professional services can be included.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

We believe that our proposal will continue to encourage the development of APMs that span rural and/or underserved areas. We solicited comment on this proposal.

The following is a summary of the comments we received regarding our proposal to (1) include payments for Method II CAH professional services furnished by eligible clinicians in an Advanced APM Entity in the numerator of the Threshold Score for the payment amount method and (2) to allow Method II CAH professional services furnished by eligible clinicians in an Advanced APM Entity and professional services furnished by eligible clinicians in an Advanced APM Entity at RHCs and FQHCs to place a beneficiary in the numerator of the Threshold Score for the patient count method.

Comment: A few commenters expressed support for the treatment of CAH, RHC, and FQHC services to enable them to be a factor in the patient count method. One commenter stated that FQHC clinicians should be eligible for the APM Incentive Payment.

Response: If clinicians in RHCs or FQHCs meet the definition of eligible clinician set forth in section II.F.3. of this final rule with comment period and participate in an Advanced APM, then they will be considered for QP determination as part of the Advanced APM Entity along with all the other eligible clinicians in the group. The calculation of the APM Incentive Payment amount for an eligible clinician that practices at an RHC or FQHC will be subject to the specific criteria, which are based on Part B covered professional services, for calculating the APM Incentive Payment amounts outlined in section II.F.8.c. of this final rule with comment period.

We are finalizing the policy as proposed. We will include payments for Method II CAH professional services furnished by eligible clinicians in an Advanced APM Entity in the numerator of the Threshold Score for the payment amount method. We will also count a beneficiary in the numerator of the Threshold Score for the patient count method if the

## 7. Combination All-Payer and Medicare Payment Threshold Option

### a. Overview

Beginning in 2021, in addition to the Medicare Option, eligible clinicians may alternatively become QPs through the All-Payer Combination Option, described under section 1833(z)(2)(B)(ii) and (C)(ii) of the Act as the Combination All-Payer and Medicare Payment Threshold Option. Thus, there will be two avenues for eligible clinicians to become QPs—the Medicare Option and the All-Payer Combination Option. An eligible clinician need only meet the QP threshold under one of the two options to be a QP for the payment year. The All-Payer Combination Option provides an incentive for eligible clinicians to participate in payment arrangements with payers other than Medicare Part B that have payment designs similar to Advanced APMs. The All-Payer Combination Option uses both the methods described in the Medicare Option and methods that calculate payments for all services from all payers, with certain exceptions, that are attributable to participation in both Advanced APMs and Other Payer Advanced APMs.

Although the statutory QP threshold for an eligible clinician to be a QP (the QP Payment Amount Threshold) under the Medicare Option increases from 25 percent in 2019 and 2020 under section 1833(z)(2)(A) of the Act, to 50 percent in 2021 and 2022 under section 1833(z)(2)(B)(i) of the Act, to 75 percent beginning in 2023 under section 1833(z)(2)(C)(i) of the Act, the All-Payer Combination Option allows eligible clinicians with lower levels of participation in Advanced APMs to become QPs through sufficient participation in Other Payer Advanced APMs with payers such as State Medicaid programs and commercial payers, including Medicare Advantage plans. Section 1833(z)(2)(D) of the Act also allows the QP determination to be based on payment amount or on counts of patients in lieu of payments using the same or similar percentage criteria. These QP thresholds are presented in Tables 36 and 37 of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. The document published in the Federal Register is the official HHS-approved document.

this final rule with comment, and the process for the payment amount method is shown in

Figures H and I of this final rule with comment. We may reassess the QP Patient Count

Thresholds in future years based on the experience gained during the first years of operations.

In summary, in addition to becoming QPs through the Medicare Option, eligible clinicians may alternatively become QPs through the All-Payer Combination Option if the following steps occur as described in the associated sections of the proposed rule: (1) the eligible clinician submits to CMS sufficient information on all relevant payment arrangements with other payers; (2) based upon that information CMS determines that at least one of those payment arrangements is an Other Payer Advanced APM; (3) the eligible clinician meets the relevant QP thresholds by having sufficient payments or patients attributed to a combination of participation in Other Payer Advanced APMs and Advanced APMs.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

The document published in the Federal Register is the official HHS-approved document.

**FIGURE H: QP Determination Tree, Payment Years 2021-2022**

**FIGURE I: QP Determination Tree, Payment Years 2023 and Later**

Sections 1833(z)(2)(B)(ii) and (C)(ii) of the Act describe the payment amount method for making the QP determination under the All-Payer Combination Option. For purposes of making a QP determination under this option, a QP is an eligible clinician for whom it is determined that items and services furnished by such a professional during the most recent period for which data are available (which may be less than a year) and where the specified percent of the sum of

The document published in the Federal Register is the official HHS-approved document.

combined Medicare payments and all other payments regardless of payer are through Advanced APMs and Other Payer Advanced APMs that meet the criteria set forth in this section.

The following is a summary of the comments we received regarding our overall approach to the All-Payer Combination Option.

Comment: Several commenters supported aligning policies for the All-Payer Combination Option with those for the Medicare Option and emphasized the value of consistent models, measures, and reporting mechanisms across payers. One commenter appreciated our recognition of eligible clinicians engaging in APMs with payers other than Medicare and recommended that CMS minimize administrative burdens associated with such eligible clinicians demonstrating their participation in Other Payer Advanced APMs. Another commenter supported the proposal to implement the All-Payer Combination Option beginning in 2021.

By contrast, one commenter expressed concern about extending Advanced APMs to other payer arrangements by identifying Other Payer Advanced APMs. Another commenter noted we have historically emphasized the importance of engaging multiple payers in payment reform, but has never suggested that commercial payers must offer identical arrangements to those CMS offers or replicate CMS payment models. One commenter opposed using the same criteria to determine both Advanced APM and Other Payer Advanced APMs, noting that these criteria would require large-scale renegotiation of payer contracts, which may not be within an organization's control. One commenter recommended CMS abandon the All-Payer Combination Option. Two commenters suggested that the All-Payer Combination Option be made effective earlier than payment year 2021, preferably payment year 2019. Another commenter encouraged CMS to accept risk-based non-Medicare contracts as Other Payer Advanced APMs beginning in payment year 2019. The commenter stated that clinicians who have invested in the transition to value-based care with many of their payers should not have to wait until 2021 to be rewarded.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Response: We appreciate the support for our proposed approach. We recognize that the All-Payer Combination Option will require adjustments and transitions. However, the All-Payer Combination Option is required by the statute, and we believe that it represents a promising opportunity for those participating in certain other payer arrangements to participate in the Advanced APM framework. The statute specifies the criteria for Other Payer Advanced APMs, and that those criteria generally mirror the Advanced APM criteria. However, the Other Payer Advanced APM criteria only address certain aspects of payment arrangements, leaving substantial room for flexibility. Just as they do for Advanced APMs, the criteria allow for exploration and testing of alternative payment arrangements that can improve quality and reduce cost. Finally, the statute does not allow us to make the All-Payer Combination Option effective prior to payment year 2021.

Comment: A commenter suggested CMS clearly define the process for determining whether a payment arrangement is an Other Payer Advanced APM. One commenter encouraged CMS to be flexible in the application of Other Payer Advanced APM criteria in order to encourage other payers to innovate. One commenter noted that among the 24 APMs reviewed by CMS, only six met all of the proposed criteria to be an Advanced APM, and that given these limitations, the commenter did not believe CMS has the flexibility to bring as many physicians as possible into Advanced APMs. As a result, this commenter believes Other Payer Advanced APMs and PFPMs might become more important to CMS goals, and recommended offering flexibility in the Other Payer Advanced APM criteria. One commenter recommended CMS provide additional flexibility to recognize as Other Payer Advanced APMs private payer reimbursement arrangements that accomplish high quality and efficient care but may not meet the Other Payer Advanced APM criteria. Another commenter recommended that the approach to assessing whether a payment arrangement will qualify as an Other Payer Advanced APM should

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

be phased in so that initially, participation in any payment arrangement that meets some of the criteria could be considered an Other Payer Advanced APM, and then all three criteria would apply at a later time.

Response: We appreciate the comments and the widespread desire to make as many Other Payer Advanced APMs available as possible. The statute requires us to use the three criteria discussed in section II.F.7.b. of this final rule with comment period as the basis for determining whether a payment arrangement is an Other Payer Advanced APM. We believe our proposed and final policies adhere to the statute as well as to our principles and reflect the commenters' suggestions to allow substantial flexibility in the design of payment arrangements when implementing the Quality Payment Program.

Comment: Several commenters stated that CMS should include a thorough proposal of the criteria for Other Payer Advanced APMs in the CY 2018 PFS and/or issue subregulatory guidance.

Response: We appreciate the comments. We are not sure at this time the exact vehicles through which we will establish policies and publish more information in the future, but we intend to inform the public regarding developments in the All-Payer Combination Option and Other Payer Advanced APM criteria through future rulemaking and subregulatory guidance.

Comment: One commenter believes that the inclusion of all-payer data in APMs was the most important provision of the proposed rule and stated that the number of different measures and incentives across all payers created unnecessary burden and would be difficult to compare across APMs and payers. The same commenter recommended a standardized attribution model to ensure equitable treatment of models across payers. Some commenters requested to have additional guidance on the data collection requirements and the determination of Other Payer Advanced APMs as soon as practicable. Another commenter expressed concern that the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

proposed All-Payer Combination Option extends the CMS collection of, and access to, data beyond those of Medicare patients. One commenter supported multi-payer engagement but was concerned about the willingness of commercial payers to support value-based arrangements. This commenter implored CMS to mandate that commercial payers share full claims data sets to allow clinicians to manage risk and patient populations.

Response: We do not believe that we are creating an unnecessary burden, but rather that we are proposing an approach to implementing the statute that is clear and flexible enough to be applicable to the diversity of payment arrangements. We do not believe a standardized attribution model is appropriate at this stage given the breadth of payment arrangements across payers. We are not sure at this time the exact vehicles through which we will establish policies and publish more information in the future, but we intend to inform the public regarding developments in the All-Payer Combination Option and Other Payer Advanced APM criteria through future rulemaking and subregulatory guidance.

Comment: Several commenters requested that some flexibility be provided to states in assessing their models. One commentator said that the three Other Payer Advanced APM criteria are broadly reflective of the direction states are seeking to move. One commenter noted that states and clinicians are at different points along a continuum towards their ability to meet the criteria, and states are implementing changes in a manner that reflects local health care markets and the Medicaid populations they serve. The commenter stated that recognition of the variation among states in the development and implementation of APMs is essential to accommodate Medicaid APMs, given the unique needs of Medicaid beneficiaries, different health care provider risk-bearing capacity, and health care provider infrastructure issues that states may confront. Specifically, the commenter recommended that there should be a clear optional pathway for states to contact CMS in order to have Other Payer Advanced APMs be identified or deemed as

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

such. Some commenters suggested that Medicaid APMs developed under the CPC+ model or the State Innovation Models (SIM) should be considered Other Payer Advanced APMs.

Another commenter recommended that CMS establish a process to approve state-operated APMs so that clinicians can be aware of which payment arrangements will be Other Payer Advanced APMs. One commenter believes CMS needs to clearly articulate a process for how it will determine Other Payer Advanced APMs in states that are engaged with CMS in the development of Other Payer Advanced APMs.

Response: We acknowledge that there is variation among Medicaid programs in the development and implementation of alternative payment models, which is in part due to varying state circumstances. We seek comment and input on the potential creation of a separate pathway to determine whether Medicaid APMs are Other Payer Advanced APMs prior to a QP Performance Period for the All-Payer Combination Option.

Comment: One commenter supported the proposed definition for Medicaid APMs stating that it provides some flexibility for states to implement new payment models and align core requirements for Medicaid APMs with the broader Advanced APM and Other Payer Advanced APM criteria. One commenter requested additional flexibility and consideration for state models, such as population-based payment models.

One commenter supported the proposal to assess Medicaid APMs under the Other Payer Advanced APM criteria and to include the Medicaid APM as part of the All-Payer Combination Option. This commenter agreed that CMS should generally defer to states in their design of these payment arrangements. The commenter also agreed with the proposal that if a state does not offer a Medicaid APM that meets the Other Payer Advanced APM criteria, then Medicaid payments and patients would be excluded from the All-Payer Combination Option calculations. Another commenter supported the criteria for Other Payer Advanced APMs and recommended

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

including Medicare Advantage and state programs created through the Medicaid Health Home State Plan Option in the All-Payer Combination Option calculations.

Response: We appreciate the comments and support for our proposals. We believe that the Other Payer Advanced APM criteria allow for flexibility in the design of Medicaid APMs that can be considered Other Payer Advanced APMs. However, as discussed in this section, we are interested in conducting further analysis and seeking further comment on the appropriate criteria for certain payers.

Comment: One commenter encouraged CMS to work with stakeholders in creating and streamlining a process for assessing Other Payer Advanced APMs given the inherent complexity of these arrangements. Some commenters also encouraged CMS to work with state Medicaid agencies on a parallel process to approve state-supported models, whether through their FFS program or managed care arrangements. Another commenter believes that clinicians will have difficulty determining which of their contracts count as Other Payer Advanced APMs in time for them to know if they should try to alter a contract to make it an Other Payer Advanced APM. To resolve this, the commenter suggested that CMS have a process whereby payers submit models to CMS for basic approval of the specifications as Other Payer Advanced APMs in advance of parties finalizing contracts. Two commenters suggested CMS work with the Health Care Payment Learning and Action Network (LAN) to support this process.

Response: We appreciate the comments. We seek public comment on the possibility of establishing a process to prospectively engage in design and review of payment arrangements to determine if they meet the criteria for being Other Payer Advanced APMs, particularly regarding the assessment of Medicaid APMs. In addition, we will continue to communicate our work to the LAN.

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Payer Combination Option as proposed. We are seeking additional comments on the creation of an optional pathway for states to seek a determination from CMS on whether a Medicaid payment arrangement is an Other Payer Advanced APM. We are also seeking additional comments on the overall process for reviewing payment arrangements in order to determine whether they are Other Payer Advanced APMs.

#### b. Other Payer Advanced APM Criteria

##### (1) In General

According to section 1833(z)(2)(B)(iii) of the Act, a payment arrangement is an Other Payer Advanced APM if it meets three criteria:

- CEHRT is used;
- Quality measures comparable to measures under the MIPS quality performance category apply; and
- The payment arrangement either: (1) requires APM Entities to bear more than nominal financial risk if actual aggregate expenditures exceed expected aggregate expenditures; or (2) for beneficiaries under title XIX, is a Medicaid Medical Home Model that meets criteria comparable to Medical Home Models expanded under section 1115A(c) of the Act.

Payment arrangements under any payer other than traditional Medicare, including Medicare Advantage and other Medicare-funded private plans, will be Other Payer Advanced APMs if they meet all three criteria.

##### (2) Medicaid APMs

We proposed to define a Medicaid APM as a payment arrangement under title XIX that meets the criteria to be an Other Payer Advanced APM as proposed. States can choose from different authorities in title XIX when implementing new payment models. We believe this proposal would provide some flexibility for States but align the core requirements for Medicaid

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APMs with the broader Advanced APM and Other Payer Advanced APM criteria. Otherwise, we intend to generally defer to states in their design of payment arrangements.

### (3) Medicaid Medical Home Models

We proposed that a Medicaid Medical Home Model is a Medical Home Model that is operated under title XIX instead of under section 1115A of the Act. We specifically identified Medicaid Medical Home Models because section 1833(z) of the Act mentions both medical homes generally and medical homes for beneficiaries under title XIX several times, but does not define the terms. Medicaid Medical Home is also not defined in title XIX or in Medicaid laws or regulations. Therefore, we needed to define the terms because of their importance in the Quality Payment Program. This definition of Medicaid Medical Home Model applies only for the purposes of the Quality Payment Program. We proposed that a Medicaid Medical Home Model must have the following elements at a minimum:

- Model participants include primary care practices or multispecialty practices that include primary care physician and practitioners and offer primary care services, and
- Empanelment of each patient to a primary clinician.

In addition to these elements, we proposed that a Medicaid Medical Home Model must have at least four of the following elements:

- Planned chronic and preventive care.
- Patient access and continuity.
- Risk-stratified care management.
- Coordination of care across the medical neighborhood.
- Patient and caregiver engagement.
- Shared decision-making.
- Payment arrangements in addition to, or substituting for, FFS payments (for example,

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

shared savings, population-based payments).

This definition of Medicaid Medical Home Model applies only for the purposes of the Quality Payment Program, and could be defined differently for other purposes. To define these terms, we reviewed existing and past Medical Home Models CMS developed under section 1115A of the Act, including the Comprehensive Primary Care Initiative (CPC). In addition, we reviewed a variety of other sources including several from the National Committee for Quality Assurance, the Joint Principles of the Patient-Centered Medical Home (a joint statement by the American Academy of Family Physicians, the American Academy of Pediatrics, the American College of Physicians, and the American Osteopathic Association), and the Agency for Healthcare Research and Quality. Our proposed definition of Medicaid Medical Home Model uses common elements from these sources. We believe that using a common set of elements ensures general comparability between Medical Home Models and Medicaid Medical Home Models while maintaining flexibility for the states under title XIX. We did not propose adhering to any particular organization's accreditation process for Medical Home Models or Medicaid Medical Home Models. We believe that such a policy would provide limited additional benefit while unnecessarily restricting state innovation. However, it is possible that accredited models, such as those certified by the National Committee on Quality Assurance, may also meet the definition of a Medicaid Medical Home Model. Medicaid Medical Home Models can be Other Payer Advanced APMs if they meet the criteria.

We solicited comment on the proposed definitions of Medicaid APMs and Medicaid Medical Homes Models.

The following is a summary of the comments we received regarding our definitions of Medicaid APMs and Medicaid Medical Home Models. Additional comments on the definition of Medicaid Medical Home Models were considered as part of the response to the definition of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medical Home Models in section II.F.3. of this final rule with comment period.

Comment: One commenter applauded CMS for developing an appropriate, physician-friendly, and patient-centered framework for Medicaid Medical Home Models, and agreed with CMS' proposal not to mandate a specific method or accreditation process for recognizing Medicaid Medical Home Models. Another commenter supported the proposal regarding Medicaid Medical Home Models.

Several commenters believed CMS should provide states flexibility in designing and implementing their Medicaid Medical Home Models. One commenter suggested the rule should enable states to deem and define their own patient-centered medical home programs and determine if it is a Medicaid Medical Home Model. Another commenter recommended that Other Payer Advanced APMs should include state-sponsored patient-centered medical home models that have demonstrated improvements in cost, quality, and patient experience through an evaluative process. Another commenter recommended CMS permit greater flexibility in enabling Medicaid Medical Home Models to qualify as Other Payer Advanced APMs. One commenter recommended state-based medical homes models should be considered Other Payer Advanced APMs.

One commenter recommended CMS recognize robust regional programs when assigning credit for nationally recognized medical home models. Another commenter recommended that the proposed Medicaid Medical Home Model definition be expanded to include partnerships across sectors designed to improve population health and achieve health equity.

One commenter recommended that CMS require Other Payer Advanced APMs to meet all of the proposed primary care practice criteria and characteristics required of Medical Home Models.

Response: We appreciate these comments. We believe the proposed definition of

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medicaid Medical Home Model provides states with significant flexibility for implementation.

Nothing in the definition precludes states from deeming and defining their own medical home programs. As proposed, the rule does not endorse any specific certification process for Medicaid Medical Home Models. However, we retain the authority to determine whether any payment model under title XIX meets our criteria to be a Medicaid Medical Home Model or Other Payer Advanced APMs. We do not believe at this time that it is appropriate to create additional criteria for Other Payer Advanced APMs beyond those set forth in the statute. We are adopting a definition for Medicaid Medical Home Model because it is necessary to interpret an undefined term used in the statute and identifies a subset of payment arrangements that are treated slightly different under the Other Payer Advanced APM criteria.

Comment: Some commenters requested CMS consider options for categorizing IHS, Tribal, and Urban Indian health programs as Other Payer Advanced APMs. One commenter questioned how the financial risk requirement will impact IHS, Tribal, and Urban Indian facilities.

Response: We support the pursuit of developing Other Payer Advanced APMs under a variety of health care payment programs. Payment arrangements not included under Medicare Part B could potentially qualify as Other Payer Advanced APMs for QP Performance Periods in 2019 and later.

#### (4) Use of Certified Electronic Health Record Technology

To be an Other Payer Advanced APM, as described under section 1833(z)(2)(B)(iii)(II)(bb) and (z)(2)(C)(iii)(II)(bb) of the Act, payments must be made under arrangements in which CEHRT is used. This requirement is slightly different than the requirement for Advanced APMs that “requires participants in such model to use certified EHR technology (as defined in section 1848(o)(4) of the Act),” as specified in section

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

1833(z)(3)(D)(i)(I) of the Act. Although the statutory requirements are phrased slightly differently, we believe that there is value in keeping the two standards—for Advanced APMs and Other Payer Advanced APMs—as similar as possible.

We proposed that payment arrangements would meet this Other Payer Advanced APM criterion under sections 1833(z)(2)(B)(iii)(II)(bb) and (z)(2)(C)(iii)(II)(bb) of the Act by requiring participants to use CEHRT as defined for MIPS and APMs under §414.1305. This approach is consistent with the approach for Advanced APMs as described in section II.F.4.b.(1) of this final rule with comment period. In the 2015 EHR Incentive Programs final rule (80 FR 62872 through 62873), we established the definition of CEHRT for EHR technology that must be used by eligible clinicians to meet the meaningful use objectives and measures in specific years. In the proposed rule, we proposed to adopt the specifications from within the current definition of CEHRT in our regulation at §414.1305 for eligible clinicians participating in MIPS or in APMs. This definition is identical to the definition for use by eligible hospitals and CAHs and Medicaid eligible clinicians in the EHR Incentive Programs.

In accordance with section 1833(z)(2)(C)(iii)(II) of the Act, we proposed that an Other Payer Advanced APM must require at least 75 percent of eligible clinicians in each participating APM Entity (or each hospital if hospitals are the APM participants) to use the certified health IT functions outlined in the proposed definition of CEHRT to document and communicate clinical care with patients and other health care professionals.

We solicited comment on the proposed definition of CEHRT for Advanced APMs and Other Payer Advanced APMs and whether they should be the same for both. We solicited comment on the proposed method for Other Payer Advanced APMs to meet the CEHRT use criterion.

The following is a summary of the comments we received regarding our proposal to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

require a payment arrangement to use CEHRT in order to become an Other Payer Advanced APM.

Comment: One commenter agreed with the importance of leveraging EHRs and clinical data to improve the coordination of care and improved outcomes through APMs. The same commenter encouraged CMS to use the full extent of its regulatory authority to build on existing efforts to support adoption and use of HIT among behavioral health and Long Term Support Service (LTSS) providers. The commenter appreciated the steps CMS has already taken to encourage investment in the HIT infrastructure for key Medicaid providers and suppliers, including behavioral health and LTSS providers.

An additional commenter stated CMS should not dictate which edition of CEHRT must be included in a third party contract. Likewise, the commenter stated that CMS should not lock in a level of participation at this time, but instead monitor the performance and make a determination in a later rule. Another commenter expressed concern about an increased EHR burden on clinicians because of the cost of implementing the technology. One commenter recommended a requirement that Other Payer Advanced APMs meet all measures that currently exist in Meaningful Use standards, including access to discrete records, reference disease registries, receive care alerts, provide decision support, have access to lab results, and support a patient portal.

Response: We appreciate the comments. Sections 1833(z)(2)(B)(iii)(II)(bb) and (z)(2)(C)(iii)(II)(bb) of the Act specifies that to be an Other Payer Advanced APM, the arrangement must be one in which CEHRT is used. By aligning this requirement with the CEHRT requirements in the advancing care information and Advanced APM sections of this proposed rule, this criterion avoids adding different EHR-related requirements that Other Payer Advanced APMs must place on their participants. Under this CEHRT criterion, we believe there

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

is significant flexibility for other payers to tailor HIT requirements to their particular populations and goals. We do not believe any additional requirements are warranted.

Comment: One commenter agreed the definitions for CEHRT should be the same for both Advanced APMs and Other Payer Advanced APMs. One commenter supported CMS' proposal to align the definition of CEHRT for purposes of MIPS, Advanced APMs, and other payer arrangements so as not to place undue burden on eligible clinicians participating in Other Payer Advanced APMs. The commenter requested CMS clarify the proposed method for Other Payer Advanced APMs to meet the CEHRT use criterion. The commenter also requested confirmation that, as with Advanced APMs, the requirements relate to the terms of the payment arrangement, not directly to the performance of each APM Entity or eligible clinician. One commenter suggested that other payers should be able to require that clinicians in any APM Entity using CEHRT use the functionality of the CEHRT so that they can report on applicable objectives and measures specified for the advancing care information performance category under MIPS. Another commenter expressed that EHR systems generally do not communicate well between physicians, laboratories, and hospitals, and believes that eligible clinicians should not be penalized for these system problems.

Response: We appreciate the comments and support for alignment of criteria between Advanced APMs and Other Payer Advanced APMs. Regarding the method for meeting this criterion, we confirm for commenters that the CEHRT requirement in this final rule—like all Other Payer Advanced APM criteria—is of the payment arrangement. Payment arrangements, not clinicians or entities, are determined to be Other Payer Advanced APMs. Therefore, a payer retains the flexibility to specify the use of CEHRT in a variety of ways that may be more stringent than this criterion requires, and would still meet this criterion to be an Other Payer Advanced APM so long as it ascertains that the required percentage of eligible clinicians in each

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

APM Entity use CEHRT. Accordingly, we do not penalize individual clinicians for performance under this criterion. These requirements exist only to determine whether the structure of a payment arrangement meets the Other Payer Advanced APM criteria. These topics are discussed in more depth in section II.F.4.b.(1) of this final rule with comment.

Comment: One commenter objected to our proposal to require a threshold for CEHRT use as is required for Advanced APMs, and thought that a threshold for CEHRT use was supported less by the statute in the case of the Other Payer Advanced APMs. Another commenter recommended that CMS relax the requirement that 75 percent of the clinicians use CEHRT to instead allow for glide paths that are tailored to each Other Payer Advanced APM's particular needs and capabilities. For example, the commenter suggested that payers should be required to reach 75 percent within the first 3 to 6 years of implementation. One commenter requested that states have the ability to set the CEHRT use percent criterion that defines participation in Other Payer Advanced APMs. They believed that a 75 percent threshold is too high given the lack of CEHRT uptake among key Medicaid clinicians.

Response: We appreciate the comments. As part of the alignment with CEHRT requirements across the Quality Payment Program, we are reducing the level of CEHRT use that an Other Payer Advanced APM must require of eligible clinicians in each APM Entity from 75 percent to 50 percent.

After considering public comments, we are modifying our proposal and finalizing that to be an Other Payer Advanced APM, a payment arrangement must require at least 50 percent of participating eligible clinicians in each APM Entity to use CEHRT to document and communicate clinical care.

(5) Application of Quality Measures Comparable to those under the MIPS Quality Performance Category

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Sections 1833(z)(2)(B)(ii)(II)(aa) and (C)(iii)(II)(aa) of the Act specify that, to be an Other Payer Advanced APM, a payment arrangement must apply quality measures comparable to those under the MIPS quality performance category. We proposed that the quality measures on which the Other Payer Advanced APM bases payment must include at least one of the following types of measures provided that they have an evidence-based focus and are reliable and valid:

- (1) Any of the quality measures included on the proposed annual list of MIPS quality measures;
- (2) Quality measures that are endorsed by a consensus-based entity;
- (3) Quality measures developed under section 1848(s) of the Act;
- (4) Quality measures submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act; or
- (5) Any other quality measures that CMS determines to have an evidence-based focus and are reliable and valid.

We proposed that not all quality measures in an APM are required to be “MIPS comparable” and not all payments under the APM must be based on comparable measures. This approach is similar to the requirement for Advanced APMs as described in section II.F.4.b.(2) of this final rule with comment period. We believe that under the proposed policy, Other Payer Advanced APMs would retain sufficient freedom to innovate in paying for services and measuring quality. In other words, this criterion only sets standards for payments tied to quality measurement, not other methods of payment. Conversely, a payment arrangement may test new quality measures that do not fall into the MIPS-comparable standard. So long as the payment arrangement meets the requirements set forth in this criterion, there is no additional prescription for how the payment arrangement tests additional measures that may or may not meet the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

standards under this criterion.

We want to encourage the use of outcome measures for quality performance assessment in Other Payer Advanced APMs, so we also proposed that an Other Payer Advanced APM must include at least one outcome measure if an appropriate measure (that is, the measure addresses the specific patient population and is specified for the participants' clinical setting) is available on the MIPS list of measures for that specific QP Performance Period.

We believe that this framework will provide other payers the flexibility needed to ensure that their quality performance metrics meet their unique goals. We solicited comment on this proposed criterion.

The following is a summary of the comments we received regarding our proposal that an Other Payer Advanced APM must provide for payment for covered professional services to include quality measures comparable to MIPS measures under the performance category.

Comment: One commenter agreed with the proposed flexibility in selecting quality measures that are evidence-based, reliable and valid. One commenter supported the proposal for Other Payer Advanced APMs to require eligible clinicians to report at least one quality measure comparable to measures included in the MIPS measures list. Another commenter stated CMS should consider Medicaid Core Measures to be MIPS-comparable and incorporate a review of private payer measures. The same commenter stated CMS should require an outcome measure, regardless of whether it is a measure included in the MIPS measure list. Another commenter also stated that an outcome measure should be required regardless of whether an appropriate measure included in the MIPS measure list. A different commenter opposed an approach that would require physicians to report on a complex set of measures that do not impact or influence the quality of care provided to patients. The commenter believes all measures used in MIPS and APMs must be clinically relevant, harmonized among all public and private payers, and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

minimally burdensome to report. In addition, commenters recommended CMS use the core measure sets by the multi-stakeholder Core Quality Measures Collaborative.

Response: We believe that the proposal provides a balance between the flexibility for implementing payment arrangements that payers need while also ensuring that the statutory requirement for MIPS-comparable quality measures is met. For example, based on our review, we believe the proposed criteria for an Other Payer Advanced APM allows for the use of Medicaid Core Measures because they are comparable to MIPS quality measures. We also agree with the commenters that the Core Quality Measure Collaborative, may be a valuable source of measures for inclusion in Other Payer Advanced APMs. We continue to believe that the requirement for an outcome measure is appropriate. Given the dearth of appropriate outcome measures for some specialties, we believe it is reasonable at this time to maintain the policy as proposed, which only requires the use of an outcome measure if there is an applicable one available on the MIPS list of quality measures. In addition, we believe that when quality measures are tied to payments, they do have an impact on the quality of care patients receive. Further discussion of quality measures and their comparability to MIPS can be found in section II.F.4.b.(2) of this final rule with comment period.

After considering public comments, we are finalizing our proposal without changes. To be an Other Payer Advanced APM, a payment arrangement must base payment on quality measures that are evidence-based, reliable, and valid. At least one such measure must be an outcome measure unless there is not an applicable outcome measure on the MIPS quality measure list for the QP Performance Period. The outcome measure used does not have to be one of those on the MIPS quality measure list.

#### (6) Financial Risk for Monetary Losses

As described in sections 1833(z)(2)(B)(iii)(II)(cc) and (C)(iii)(II)(cc) of the Act, the third  
1620

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

criterion that a payment arrangement must meet to be an Other Payer Advanced APM is that under the arrangement, the APM Entity must either bear more than nominal financial risk if actual aggregate expenditures exceed expected aggregate expenditures or the arrangement is a Medicaid Medical Home Model that meets criteria comparable to Medical Home Models expanded under section 1115A(c) of the Act.

The financial risk standard under this criterion is similar to the criterion we are finalizing for Advanced APMs. For purposes of determining whether the payment arrangement is an Other Payer Advanced APM, this proposal does not impose any additional performance criteria, such as actual achievement of savings, on APM Entities in other payer arrangements. As with all of the Advanced APM criteria, this requirement pertains to the payment arrangement structure, not to the performance of the participants within the payment arrangement.

This section is divided into two main parts: (1) what it means for an APM Entity to bear financial risk if actual aggregate expenditures exceed expected aggregate expenditures under a payment arrangement; and (2) what amounts of risk are considered to be more than nominal.

#### (a) Bearing Financial Risk for Monetary Losses

We proposed a generally applicable standard for Other Payer Advanced APMs and a slightly different standard for Medicaid Medical Home Models. We want to be consistent with and comparable to the Advanced APM financial risk standard within the limits of the statute.

##### (i) Generally Applicable Other Payer Advanced APM Financial Risk Standard

We proposed that the generally applicable financial risk standard for Other Payer Advanced APMs would be that a payment arrangement must, if APM Entity actual aggregate expenditures exceed expected aggregate expenditures during a specified performance period:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

- Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;

or

- Require direct payments by the APM Entity to the payer.

We believe this financial risk criterion best distinguishes most payment arrangements from those that are focused on challenging physicians and practitioners to assume risk and provide high value care. We expect that an increasing proportion of other payer arrangements will meet that bar over time. This proposal is based on the statutory requirement that the APM Entity bear risk if aggregate actual expenditures exceed aggregate expected expenditures under the model, and is consistent with our proposal for the corresponding criterion proposed for Advanced APMs. We understand that many stakeholders believe that business risk should be sufficient to meet this Advanced APM criterion. We do not intend to minimize the substantial time and financial commitments that APM Entities invest to become successful APM participants. We note that there is also difficulty in creating an objective and enforceable standard for determining whether an entity's business risk exceeds a nominal amount, and that the statutory framework for the APM Incentive Payment recognizes that not all alternative payment arrangements will meet the criteria to be considered for purposes of the QP determination. We solicited comments regarding the proposed standard and whether there are other types of arrangements that should be incorporated into the standard.

The following is a summary of the comments we received regarding our proposal to set a generally applicable Other Payer Advanced APM financial risk standard.

Comment: One commenter supported using similar criteria to those proposed for Advanced APM criteria to assess the financial risk in the payment arrangement. A few commenters recommended CMS consider broad financial risk requirements so that clinicians can meet the Other Payer Eligible APM criteria. One commenter noted that it may be difficult to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

design Other Payer Advanced APMs that both meet the proposed financial risk standards and are attractive to eligible clinicians, and requested CMS to consider adding flexible arrangements that meet the spirit of the statute while not necessarily meeting the exact criteria that eligible clinicians share risk. Another commenter recommended that CMS give Other Payer Advanced APMs more flexibility in defining risk standards and not require complete alignment of risk definitions, as payers need a period of flexibility in tailoring risk arrangements depending on the type or maturity of the APM model, its population characteristics, and unique market conditions. Specifically, the commenter recommended that CMS give other payers the same flexibility to align, not match perfectly, their risk models under Other Payer Advanced APMs as under the Comprehensive Primary Care Plus (CPC+) model. Another commenter opposed the proposed financial risk standard for Other Payer Advanced APMs because the commenter stated that it places an arbitrary imposition of financial risk upon clinicians and violates the intent of the law.

Response: We appreciate the comments. We believe that in order to implement the statute, it is important to have a meaningful financial risk standard. We believe the proposed elements are well established. And while they are intended to be challenging, they also provide for flexibility in the design of Other Payer Advanced APMs. We also believe that the financial risk standard provides flexibility to states and private payers in the design of their payment arrangements.

Comment: Another commenter said there are opportunities and challenges with a federally-set benchmark for risk that would be applied to Medicaid APMs, and further understanding of these issues is needed before the rule is finalized. This commenter opined states are working to incorporate shared accountability for quality and outcomes with eligible clinicians through both FFS and capitated managed care models. However, there are both merits and challenges in setting a federal benchmark for the level of risk that Medicaid APMs must

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

assume to be considered Other Payer Advanced APMs.

Response: We appreciate the comments. We agree that further research and analysis on the level of nominal risk would be appropriate, particularly for Medicaid APMs, which is why we are seeking additional comments on setting specific levels for nominal risk as discussed in section II.F.7.(b) of this final rule with comment period.

After considering public comments, we are finalizing our proposal to set a generally applicable Other Payer Advanced APM financial risk standard, as proposed, without changes. The generally applicable financial risk standard for Other Payer Advanced APMs is that, if the APM Entity's actual aggregate expenditures exceed expected aggregate expenditures during a specified performance period, the payer will:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;
  - Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;
- or
- Require direct payments by the APM Entity to the payer.

(ii) Medicaid Medical Home Model Financial Risk Standard

We proposed that for a Medicaid Medical Home Model to be an Other Payer Advanced APM if the APM Entity's actual aggregate expenditures exceed expected aggregate expenditures, the Medicaid Medical Home Model must:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;
- Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;
- Require direct payment by the APM Entity to the Medicaid program; or
- Require the APM Entity to lose the right to all or part of an otherwise guaranteed

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

payment or payments.

For instance, a Medicaid Medical Home Model would meet our proposed financial risk criterion if it conditions the payment of some or all of a regular care management fee to medical home APM Entities upon expenditure performance in relation to a benchmark. Because the arrangement would require no direct payment as a consequence for failure to meet expenditure standards, such a medical home would not necessarily be worse off than it had been prior to the decreased payment. However, it would be worse off in the future than it otherwise would have been had it met expenditure standards. Similarly, a Medicaid Medical Home Model that offers expenditure and quality performance payments in addition to payment withholds that can be earned back for meeting minimum requirements would also meet this criterion. Consistent with the treatment of Medical Home Models under the statute, this proposal acknowledges the unique challenges of medical homes in bearing risk for losses while maintaining a more rigorous standard than mere business risk.

We believe that because Medicaid Medical Home Models are unique types of Medicaid APMs and because they are identified and treated differently under the statute, it is appropriate to establish a unique standard for bearing financial risk that reflects these differences and remains consistent with the statutory scheme, which is to provide incentives for participation by eligible clinicians in advanced APMs.

Similar to Medical Home Model standards for Advanced APMs, which are discussed in II.F.4.b.(3) of this final rule with comment period, we believe that it would be appropriate to impose size and composition limits for Medicaid Medical Home Models to ensure that the focus is on organizations with a limited capacity for bearing the same magnitude of financial risk as larger organizations do, namely, small primary care-focused organizations. We proposed that this limit would only apply to APM Entities that participate in Medicaid Medical Home Models and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

that have 50 or fewer eligible clinicians in the organization through which the APM Entity is owned and operated. Thus, in a Medicaid Medical Home Model that is an Other Payer Advanced APM, only those APM Entities that are part of a parent organization with 50 or fewer eligible clinicians would be APM Entities. We believe it is appropriate to use eligible clinicians, rather than physicians, when setting this threshold as the number of eligible clinicians both reflects organizational resources and capacity and also may differ substantially across organizations with the same number of physicians.

We also believe that this size threshold of 50 eligible clinicians is appropriate as organizations of that size have demonstrated the capacity and interest in taking on risk, and organizations may also join together to take on risk collectively, for example, in an ACO. In the event that a Medicaid Medical Home Model happens to have criteria that meet the Advanced APM financial risk criterion that is generally applicable to all Other Payer Advanced APMs, this organizational size limitation would be moot.

There are several unique aspects of Medicaid Medical Home Models, which statute specifically singles out for unique treatment, and their participating APM Entities (medical homes) that support the need for a separate standard to assess financial risk if actual expenditures exceed expected expenditures. Medical homes are generally more limited in their ability to bear financial risk than other entities because they tend to be smaller and predominantly include primary care practitioners, whose revenues are a smaller fraction of the beneficiaries' total cost of care than those of other eligible clinicians. Moreover, Medicaid medical home practices serve low income populations and those with significant health disparities; due to the method of payment for care for these populations, Medicaid medical home practices often have relatively low revenues. Lastly, Medicaid Medical Home Models to date have not required participants to bear substantial downside risk, and including such a requirement under this program would

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

create a significant challenge for medical homes to serve their patients.

We solicited comment on the proposed financial risk standard set forth for Medicaid Medical Home Models and on alternative standards that would be consistent with the statute and could achieve our stated goals. We also solicited comment on types of financial risk arrangements that may not be clearly captured in this proposal.

The following is a summary of the comments we received regarding our proposal for the Medicaid Medical Home Model financial risk standard. Comments on the 50 eligible clinician size limit are aggregated in the comments on the correlating Medical Home Model financial risk criterion in section II.F.4. of this final rule with comment period.

Comment: One commenter agreed with our proposed approach. One commenter believed CMS should remove the proposed financial risk standard from the proposed rule and that APM Entities in Medicaid Medical Home Models should not be subject to any financial risk requirement.

Another commenter recommended that Medicaid Medical Home Models not be subjected to downside risk unless and until it can be clearly demonstrated generally that they are capable or caring for patients without any decrease in access or quality under the limited payments provided by Medicaid in most states. An additional commenter recommended CMS eliminate the nominal risk requirements for Medicaid Medical Home Models. By definition, physicians who treat Medicaid and dual eligible patients are assuming more than nominal financial risk, given the very low reimbursement rates.

One commenter stated that the financial risk standard needs to be revised to ensure that Medicaid medical homes serving vulnerable populations are not forced to assume financial risks that would jeopardize patients' access to care. Another commenter agreed that APM Entities should bear the financial risk, but noted that special considerations may be appropriate for

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medicaid Medical Home Models depending on size as some FQHCs, RHCs, and Tribal 638 safety net clinics may be smaller with more diverse group of primary care practitioners. The same commenter noted that CMS has historically allowed states to implement APMs for FQHC/RHCs from the traditional PPS method, and requested CMS specifically address how states' models that include FQHCs and RHCs would be assessed to meet the Other Payer Advanced APM criteria.

Response: We appreciate the comments and concerns about applying the financial risk standard to Medicaid Medical Home Models. Section 1833(z)(2)(B)(iii) of the Act requires that in order to meet the Other Payer Advanced APM criteria, the APM Entities must bear more than nominal financial risk if actual aggregate expenditures exceed expected aggregate expenditures or be in a Medicaid Medical Home Model that meets criteria comparable to Medical Home Models expanded under section 1115A(c) of the Act. Because there are currently no expanded Medical Home Models, we do not believe there is a way to evaluate whether a Medicaid Medical Home Model meets criteria comparable to expanded Medical Home Models. As such, in order to be determined an Other Payer Advanced APM, a Medicaid Medical Home Model must require its participating APM Entities to bear more than nominal financial risk. If a Medical Home Model is expanded in the future under section 1115A(c) of the Act, we will address how Medicaid Medical Home Models that have comparable criteria will meet the financial risk portion of this criterion. We are already providing special consideration for the risk that Medicaid Medical Home Models must bear by proposing separate financial risk and nominal amount standards.

We are also finalizing certain provisions at section II.F.6.d. of this final rule with comment period to ensure that CAH, RHC and FQHC participation in Advanced APMs is considered to the extent applicable when calculating Threshold Scores under the patient count

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

method.

After considering public comments, we are finalizing our proposal for the Medicaid Medical Home Model financial risk standard without changes. The Medicaid Medical Home Model financial risk standard is that, if the APM Entity's actual aggregate expenditures exceed expected aggregate expenditures during a specified performance period, the payer will:

- Withhold payment for services to the APM Entity and/or the APM Entity's eligible clinicians;
- Reduce payment rates to the APM Entity and/or the APM Entity's eligible clinicians;
- Require direct payment by the APM Entity to the Medicaid program; or
- Require the APM Entity to lose the right to all or part of an otherwise guaranteed payment or payments.

(b) Nominal Amount of Risk

When an other payer risk arrangement meets the proposed financial risk standard, we would then consider whether the risk is of a more than nominal amount such that it meets this nominal amount standard. Similar to the financial risk portion of this assessment, we proposed to adopt a generally applicable nominal amount standard for Other Payer Advanced APMs and a unique nominal amount standard for Medicaid Medical Home Models.

We proposed to measure three dimensions of risk to determine whether a payment arrangement meets the nominal amount standard: (a) marginal risk, which is a common component of risk arrangements—particularly those that involve shared savings—that refers to the percentage of the amount by which actual expenditures exceed expected expenditures for which an APM Entity would be liable under a payment arrangement; (b) minimum loss rate (MLR), which is a percentage by which actual expenditures may exceed expected expenditures without triggering financial risk; and (c) total potential risk, which refers to the maximum

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

potential payment for which an APM Entity could be liable under a payment arrangement. An example of marginal risk is an ACO that has a sharing rate, or marginal risk, of 50 percent and exceeds its benchmark (expected expenditures) by \$1 million, the ACO would be liable for \$500,000 of those losses. The marginal risk could also vary with the amount of losses.

To determine whether a payment arrangement satisfies the total risk portion of the nominal amount standard, we would identify the maximum potential payment an APM Entity could be required to make as a percentage of the expected expenditures under the payment arrangement. If that percentage exceeded the required total risk percentage, then the arrangement would satisfy the total risk portion of the nominal amount standard.

To determine whether a payment arrangement satisfies the marginal risk portion of the nominal amount standard, we would examine the payment required under the payment arrangement as a percentage of the amount by which actual expenditures exceeded expected expenditures. We proposed that we would require that this percentage exceed the required marginal risk percentage regardless of the amount by which actual expenditures exceeded expected expenditures, with two exceptions.

First, we proposed a maximum allowable “minimum loss rate” (MLR) of 4 percent in which the payment required by the payment arrangement could be smaller than the nominal amount standard would otherwise require when actual expenditures exceed expected expenditures by less than 4 percent; this exception accommodates payment arrangements that include zero risk for small losses but otherwise satisfy the marginal risk standard. We also proposed a process through which we could determine that a risk arrangement with an MLR higher than 4 percent could meet the nominal amount standard, provided that the other portions of the nominal amount standard are met. In determining whether such an exception would be appropriate, we would consider: (1) whether the size of the attributed patient population is small;

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

(2) whether the relative magnitude of expenditures assessed under the payment arrangement is particularly small; and (3) in the case of test of limited size and scope, whether the difference between actual expenditures and expected expenditures would not be statistically significant even when actual expenditures are 4 percent above expected expenditures. We note that we would grant such exceptions rarely, and we would expect APMs considered for such exceptions to demonstrate that a sufficient number of APM Entities are likely to incur losses in excess of the higher MLR. In other words, the potential for financial losses based on statistically significant expenditures in excess of the benchmark remains meaningful for participants.

Second, we proposed that the payment required by the payer could be smaller when actual expenditures exceed expected expenditures by enough to trigger a payment greater than or equal to the total risk amount required under the nominal amount standard. This exception ensures that the marginal risk requirement does not effectively require payers to incorporate total risk greater than the amount required by the total risk portion of the standard to become Other Payer Advanced APMs.

In evaluating both the total and marginal risk portions of the nominal amount standard, we would not include any payments the APM Entity or its participating eligible clinicians would make to the other payer if actual expenditures exactly matched expected expenditures. In other words, payments made to a payer outside the risk arrangement related to expenditures would not count toward the nominal amount standard. This requirement ensures that perfunctory or pre-determined payments do not supersede incentives for improving efficiency. For example, a payment arrangement that simply requires an APM Entity to make a payment equal to 5 percent of the payment arrangement benchmark at the end of the year, regardless of actual expenditure performance, would not satisfy the nominal amount standard.

Finally, we proposed that the amounts described in this section need not take a shared

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

savings structure in which financial risk increases smoothly based on the amount by which an APM Entity's actual expenditures exceed expected expenditures. The risk arrangement must be tied to expenditures, but the amount of that risk would not have to be directly proportional to expenditures. For instance, an APM Entity could be required to pay the payer a flat amount or an amount tied to the number of attributed beneficiaries in the case of exceeding an expenditure benchmark, provided that these amounts are otherwise structured in a way that satisfies the nominal amount standard.

(i) Generally Applicable Other Payer Advanced APM Nominal Amount Standard

Except for risk arrangements described under the Medicaid Medical Home Model Standard, we proposed that for a payment arrangement to meet the nominal amount standard the specific level of marginal risk must be at least 30 percent of losses in excess of the expected expenditures and total potential risk must be at least four percent of the expected expenditures.

In establishing the proposed criteria for Other Payer Advanced APMs, we kept the approach to nominal risk as consistent as possible with the approach for the proposed Advanced APM criteria. The statute specifies that the Advanced APM Entity must bear more than nominal financial risk if actual aggregate expenditures exceed expected aggregate expenditures. We believe it is important, to the extent possible and consistent with the statute, to adopt consistent financial risk standards with the Advanced APM standard as described in section II.F.4.a of the proposed rule, so that eligible clinicians can base their decisions on participation in these Other Payer Advanced APMs on a consistent set of criteria. The Advanced APM nominal amount standard section of the proposed rule, II.F.4.a, describes the process by which we arrived at the proposed values.

For Medicaid APMs we proposed the same standard as for Other Payer Advanced APMs. However, we recognize that Medicaid practitioners may be less able to bear substantial financial

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

risk because they serve low-income populations and those with significant health disparities.

Therefore, we solicited comment and supporting evidence on whether the proposal offered identifies the appropriate amounts of nominal risk for Medicaid APMs.

The following is a summary of the comments we received regarding our proposal to set a generally applicable Other Payer Advanced APM nominal amount standard.

Comment: Several commenters believed the nominal amount standard is overly complicated and encouraged CMS to simplify the standard. One suggested CMS include only the MLR and total potential risk requirement proposed in the regulation. This commenter further requested that CMS modify the total potential risk to include an entity's Part A and B revenue to provide the assurance that an entity is not assuming more risk than their potential revenues. One commenter requested clarification regarding what those participating in the All-Payer Combination Option will have to do in order to satisfy the nominal amount standard.

An additional commenter requested that the nominal amount standard initially mirror the medical home approach so that it is assessed through APM Entity revenue or a choice between APM Entity revenue and Advanced APM benchmarks, and has low requirements with phased increases mirroring the approach taken with Medicaid Medical Home Models.

Response: As we noted in the section of the rule discussing the nominal amount standard for Advanced APMs, we understand commenters' concerns that these aspects of the standard are complex enough to require additional time to understand. We note, however that these standards will not take effect until QP Performance Periods beginning in 2019 and later; we believe that this time will help mitigate commenters' concerns about complexity. Moreover, we believe that using these measures of risk will ensure the program integrity of the All-Payer Combination Option so that payment arrangements between other payers and APM Entities cannot be engineered in such a way as to provide an avenue to QP status that meets the financial risk

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

criterion but makes the actual likelihood of losses based on performance very low. This could potentially result in payment of the APM Incentive Payment to APM Entities in payments arrangements that do not adhere to our principles of setting meaningful financial risk standards.

We put these protections in place for Other Payer Advanced APMs and not Advanced APMs because we have direct control over the design of Advanced APMs but not of payment arrangements of other payers. We must act in the interest of the Medicare Trust Funds when designing Advanced APMs, but other payers do not have the same obligation and thus may be interested in assisting APM Entities to receive the APM Incentive Payment. Although states design and implement Medicaid APMs that are generally subject to federal approval processes such as state plan amendment approvals, we have no direct or indirect control over the payment arrangements of private payers. Including marginal risk as a component of the nominal amount standard prevents the consideration of payment arrangement designs that could contribute to the attainment of QP status through arrangements far less rigorous than those in Advanced APMs. There may be other ways of achieving the same program integrity goals and we seek comment on this policy. For instance, we are considering ways to issue guidance or design federal approval processes to promote Medicaid APMs focused on high value care to Medicaid beneficiaries that also align with our program integrity objectives.

Comment: A few commenters expressed concern that, if not set correctly, the level of risk under the nominal amount standard might jeopardize Medicaid clinicians' abilities to provide effective care. One commenter, in commenting on the nominal amount standard for Advanced APMs, stated that practices should be encouraged to serve Medicaid and dual eligible patients, but the risk requirements are likely to have the opposite effect. The commenter stated that simply providing care to Medicaid and dual eligible patients could be considered to involve more than nominal risk for monetary losses due to the very low payment rates in most Medicaid

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

programs. Another commenter expressed concern about ongoing cuts states are making in Medicaid reimbursement rates, and believed CMS should promulgate rules that prevent damaging reimbursement and encourage exploration of innovative care delivery options. Another commenter said that any adjustment in payments must take into account socio-demographic factors such as income, race and educational attainment.

Response: We understand that Medicaid clinicians may have less risk-bearing capacity than other clinicians, particularly in cases in which they serve a relatively high proportion of high-risk patients. We believe the proposed nominal amount standard allows Medicaid APMs and Medicaid Medical Home Models to create meaningful incentives for improving the care for their populations. However, we seek additional comments on the structure and levels of risk in the nominal amount standard as applied to Medicaid APMs.

Comment: One commenter stated that there are both merits and challenges in setting a standard for the level of risk that Medicaid payment arrangements must meet to be considered Medicaid APMs. This commenter said there is significant variation among Medicaid clinicians' ability and willingness to assume risk, especially given the vulnerable and complex population Medicaid clinicians serve. The commenter also stated that state Medicaid directors are cautious to apply risk where it seems inappropriate or premature. However, the commenter also stated that a federal risk standard might support movement toward risk-based models in many states. The commenter expressed that this is a critical aspect of the regulation that warrants further engagement with states and urged CMS to evaluate state-specific situations where Medicaid clinicians are assuming risk and to further engage states on this issue.

Response: We acknowledge the potential benefits and challenges of setting a nominal amount standard that applies to other payers, including state Medicaid programs, and believe we have taken the considerations into account in our finalized policy. We have engaged with

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

stakeholders on this issue and will continue to do so. We realize that although the All-Payer Combination Option does not go into effective until the 2019 QP Performance Period for the 2021 payment year, Medicaid programs and other payers may begin their work developing payment arrangements that meet the Other Payer Advanced APM criteria. For this reason, we believe it is important to establish these policies now, even though there may be subsequent modifications through future rulemaking.

Comment: One commenter generally supported the proposal regarding standards for nominal risk, but stated that the standard for Medicaid APMs that are not Medicaid Medical Home Models be set lower, at 3 percent. Another commenter supports the simplification of the nominal risk amount and requested CMS lower the proposed loss sharing limit for Other Payer Advanced APMs from 4 percent to a more reasonable threshold, such as 10 percent of physicians' payments for covered Part B professional services, or 1 percent of total Parts A and B target costs, whichever is lower.

One commenter recommended that CMS use risk corridors across programs to allow APMs to align their operations and financial approach, while reducing administrative overhead. One commenter suggested a 30 percent marginal risk threshold, with a 1-2 percent minimum loss rate, and recommended that CMS consider using the full-risk structure within the Next Generation ACO model as a framework when assessing nominal risk.

Response: We believe that the meaning of “nominal” can be relative and that for many APM Entities, 4 percent of a total cost of care benchmark could be substantially more than nominal. We discuss the nominal amount standard in depth in section II.F.4.a of this final rule with comment period. Depending on the size and clinician composition of an APM Entity, a total risk cap of 4 percent of a total cost of care benchmark could mean risk for losses that are up to or greater than 100 percent of some APM Entities' revenue from a payer. Therefore, we

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

recognize that a revenue-based standard would provide an alternative approach under the nominal amount standard that is particularly meaningful to practices of certain sizes. However, we caution that a revenue-based standard is not easily applied to many current payment arrangements, which tend to base risk arrangements on expenditure benchmarks that are unrelated to a particular APM Entity's revenue. We believe that total cost of care benchmarks are optimal for many APMs, and those will continue to represent the preferred standard for assessing performance in terms of cost. We also caution that, under a revenue-based standard, certain types of APM Entities may have a significant probability of incurring losses outside the stop loss and thus bear no responsibility for increases in expected expenditures beyond that point, which may undermine the ability of such APMs to drive performance for those APM Entities. In seeking a risk standard that is meaningful but not excessive, we sought to balance these considerations.

After considering the comments, we are finalizing the proposed policy with modifications. First, we are finalizing the marginal risk and MLR components as proposed. To meet the Other Payer Advanced APM nominal amount standard, a payment arrangement's level of marginal risk must be at least 30 percent of losses in excess of the expected expenditures, and the maximum allowable MLR must be 4 percent. We seek additional comments on this approach for Other Payer Advanced APMs and additional information on other approaches that ensure payment arrangements are not engineered to meet the financial risk criterion but avoid the likelihood of APM Entities experiencing losses based on their performance.

Second, we are finalizing that a payment arrangement must require APM Entities to bear financial risk for at least 3 percent of the expected expenditures for which an APM Entity is responsible under the payment arrangement. For episode payment models, expected expenditures means the target price for an episode. We also note that we intend to establish through future rulemaking a total risk standard based on the revenue of the APM Entity from the payer in a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

manner that would parallel the standard we are finalizing in the Advanced APM nominal amount standard under section II.F.4.b.(4) of this final rule with comment period. Therefore, we seek comment for future consideration on the amount and structure of the revenue-based nominal amount standard for QP Performance Periods in 2019 and later. Specifically, we seek comment on: (1) setting the revenue-based standard for 2019 and later at up to 15 percent of revenue; or (2) setting the revenue-based standard at 10 percent so long as risk is at least equal to 1.5 percent of expected expenditures for which an APM Entity is responsible under an APM. We expect to apply the same percentage standards for Other Payer Advanced APMs as for Advanced APMs; however, we seek comment on how and why this standard could differ for Medicaid APMs relative to the generally applicable Other Payer Advanced APM standard.

Our intention in setting a revenue-based nominal amount standard is to tailor the level of risk an APM Entity must bear relative to the resources available to it. In instances where an APM Entity is one component of a larger health care provider organization, we believe that the revenue of the larger organization is a more accurate measure of the resources available to the APM Entity and should be the basis for setting the revenue-based nominal amount standard, even if only a portion of the organization is participating in the APM Entity.

However, we do not believe that applying the nominal amount standard at a level other than the APM Entity is operationally feasible at this point in time, and doing so in the other payer context may pose unique challenges relative to those we face under Medicare. Nevertheless, ideally, the nominal amount standard would take into consideration the resources available to an APM Entity using a measure such as revenue for the parent organization. We are evaluating the feasibility of implementing such a measure in lieu of APM Entity revenue for the third year of the program and later years. Under such an approach, we would anticipate basing the revenue-based nominal amount standard on the total revenues from a payer across the APM

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Entity, any parent organizations, any subsidiary organizations, and any subsidiaries of parent organizations for all eligible clinicians and groups who are participants of an APM Entity. We seek comment on this approach and how such an approach could be implemented while minimizing burden on participants.

(ii) Medicaid Medical Home Model Nominal Amount Standard

For Medicaid Medical Home Models, we proposed that the minimum total annual amount that an APM Entity must potentially owe or forego to be considered an Other Payer Advanced APM must be at least:

- In 2019, 4 percent of the APM Entity's total revenue under the payer.
- In 2020 and later, 5 percent of the APM Entity's total revenue under the payer.

We believe that because few Medicaid Medical Home Model participants have experience with financial risk, and because they tend to be smaller in size, both in terms of the number of clinicians and revenue, than other APM Entities, we should not include a potentially excessive nominal amount for such entities in the first year of the program. We have also taken into account that the statute explicitly highlights Medical Home Models for special treatment under the Quality Payment Program. We generally have less information on Medicaid Medical Home Models and their performance to date compared to our information on Medical Home Models. Medicaid Medical Home Models are still developing, and we believe the introduction of a nominal amount standard that is not currently widely represented in the marketplace should be approached in a measured manner. We therefore believe that the unique characteristics of Medicaid Medical Home Models warrant the application of a nominal amount standard that reflects these differences.

We solicited comment on the proposed nominal amount standard. We also solicited comment on the potential inclusion of a marginal risk amount in the standard and the extent to

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

which it would be applicable.

The following is a summary of the comments we received regarding our proposal to set a Medicaid Medical Home Model nominal amount standard.

Comment: One commenter supported the lower risk amount for Medicaid Medical Home Models. Another commenter expressed concern that CMS' proposed nominal amount standard for Medicaid Medical Homes Models of 4 percent of the APM Entity's total Medicaid revenue in 2019 and 5 percent in 2020 and thereafter is too high to encourage medical practices to serve Medicaid and dual eligible patients. This commenter said providing care to Medicaid and dual eligible patients would be considered by most physicians to involve more than nominal risk of financial losses due to the very low payment rates in most Medicaid programs.

Response: We understand the concern that the proposed nominal amount standard may be too high and could serve as a deterrent to the development of and participation in Medicaid Medical Home Models. However, we believe that, as with Medical Home Models under Medicare, the proposed values are appropriate for those entities that are interested in assuming risk and participating in the Quality Payment Program. We also believe that the finalized Advanced APM financial risk criterion for Medicaid Medical Home Models, combined with this nominal amount standard, allows for payment arrangement designs that motivate improvements in the cost and quality of care while not deterring practices from participating in the program. We are finalizing the standard as proposed to be consistent with the Advanced APM nominal amount standard for Medical Home Models as discussed in section II.F.4.b.(3) of this final rule with comment. Setting the standard that starts at 4 percent of revenue and increases to 5 percent of revenue represents the meaning of "nominal" in the Medicaid Medical Home Model context.

After considering public comments, we are finalizing the Medicaid Medical Home Model nominal amount standard as proposed. In order to be an Other Payer Advanced APM, the

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

minimum total annual amount that a Medicaid Medical Home Model must require an APM

Entity to potentially owe or forego must be at least:

- In 2019, 4 percent of the APM Entity's total revenue under the payer.
- In 2020 and later, 5 percent of the APM Entity's total revenue under the payer.

(c) Capitation

We proposed that full capitation risk arrangements would meet the Other Payer Advanced APM financial risk criterion. We proposed that for purposes of this rulemaking, a capitation risk arrangement means a payment arrangement in which a per capita or otherwise predetermined payment is made to an APM Entity for services furnished to a population of beneficiaries, and no settlement is performed for the purpose of reconciling or sharing losses incurred or savings earned by the APM Entity. Our rationale for this policy is the same as the rationale on capitation for Advanced APMs described in section II.F.4.b.(3) of this final rule with comment period. As such, we reiterated that full capitation risk arrangements are not simply a cash flow mechanism.

We solicited comment on our proposal that capitation risk arrangements would meet the financial risk criterion for Other Payer Advanced APMs and on our proposed definition of a capitation risk arrangement. We also solicited comment on other types of arrangements that may be suitable for such treatment for purposes of this financial risk criterion.

The following is a summary of the comments we received regarding our proposal that full capitation risk arrangements will automatically meet the Other Payer Advanced APM financial risk criterion.

Comment: One commenter supported the proposal that capitation automatically satisfies the financial risk criterion, but requested CMS to explicitly include partial capitation as well if it meets the nominal risk criteria. Another commenter recommended existing arrangements, such

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

as capitation, be included in the proposed rule definition of Other Payer Advanced APMs that bear more than nominal risk, because the commenter believes that such arrangements require the organization to absorb costs that exceed expected expenditures. This commenter requested clarification on whether tertiary care centers would be considered Other Payer Advanced APMs when these centers have capitated arrangements with other clinicians, and where patients' primary care clinicians are not directly affiliated with the tertiary care center.

One commenter supported the proposal that that full capitation risk arrangements meet the financial risk criterion for APM Entities with full downside risk, but noted that some entities are in the middle of transforming their practices. The commenter stated that risk during transition could be mitigated through risk corridors and other methods that could be used while payers are obtaining and improving data necessary to improve the appropriateness of rates to health plans and clinicians.

Response: Partial capitation arrangements can satisfy the financial risk criterion, but will not do so automatically. They will be assessed according to the nominal amount standard. We appreciate the suggested payment methodology, but we are not prescribing any specific methodology for such arrangements. We also remind commenters of the Physician-Focused Payment Model Technical Advisory Committee described in section II.F.10. of this final rule with comment period.

After considering public comments, we are finalizing our proposal that full capitation risk arrangements will automatically meet the Other Payer Advanced APM financial risk criterion and our proposal to define capitation risk arrangement without changes.

#### (d) Criteria Comparable to Expanded Medical Home Models

In accordance with sections 1833(z)(2)(B)(iii)(II)(cc)(BB) and (C)(iii)(II)(cc)(BB) of the Act, we proposed that Medicaid Medical Home Models that meet criteria comparable to a

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

Medical Home Model expanded under section 1115A(c) of the Act would meet the Other Payer Advanced APM financial risk criterion. We proposed that we would specify in subsequent rulemaking the criteria of any Medical Home Model that is expanded under section 1115A(c) of the Act that would be used for purposes of making this comparability assessment. We believe that the expanded Medical Home Model criteria can only be used for comparison when a Medical Home Model is, in fact, expanded as described in section II.F.4.b.(6) of the proposed rule, not merely by satisfying the expansion criteria under section 1115A(c) of the Act. If no such Medical Home Model has actually been expanded under section 1115A(c) of the Act, we would not have any criteria for comparison. In the absence of any expanded Medical Home Model to which we could draw comparisons, Medicaid Medical Home Models must meet the financial risk criterion through the other provisions (the financial risk and nominal amount standards) to be an Other Payer Advanced APM. We solicited comment on how to determine the criteria of an expanded Medical Home Model that could be used for comparison, and on how similar the Medicaid Medical Home Model criteria must be to the expanded Medical Home Model criteria in order to be considered “comparable.”

The following is a summary of the comments we received regarding our proposal to address criteria comparable to expanded Medicaid Medical Home Models in future rulemaking.

Comment: One commenter appreciated that CMS plans for future rulemaking in this area, and agrees that no current models meet the expansion criteria.

Response: We appreciate the comment.

We are finalizing our proposal that Medicaid Medical Home Models that meet criteria comparable to a Medical Home Model expanded under section 1115A(c) of the Act would meet the Other Payer Advanced APM financial risk criterion. We will specify in future rulemaking the criteria for any Medical Home Model that is expanded under section 1115A(c) of the Act, and

**Notice:** This HHS-approved document has been submitted to the Office of the Federal Register (OFR) for publication and has not yet been placed on public display or published in the Federal Register. This document may vary slightly from the official published document if minor editorial changes have been made during the OFR review process. The document published in the Federal Register is the official HHS-approved document.

specify how they would be used for purposes of making this comparability assessment.

#### (7) Medicare Advantage (MA)

For the APM Incentive Payment, section 1833(z)(1)(A) of the Act states that the APM Incentive Payment is based on payments for Part B covered professional services, which do not include payments for services furnished to MA enrollees. For QP determination calculations, we believe it is important to note that Advanced APMs may involve MA plans and payers other than Medicare. Under the All-Payer Combination Option for QP determinations, eligible clinicians can meet the QP threshold based in part on payment amounts or patients counts associated with MA plans and other payers, provided that such arrangements meet the criteria to be considered Other Payer Advanced APMs. However, under sections 1833(z)(2)(A), (2)(B)(i), and (3)(B)(i) of the Act, payments under MA and other payer arrangements cannot be included in the QP determination calculations under the Medicare Option, which requires that we only consider payment amounts or patient counts for Medicare Part B covered professional services. Regardless of which option—Medicare or All-Payer Combination—is used to determine that an eligible clinician is a QP for a year, the APM Incentive Payment calculation will only be based upon payments for Medicare Part B covered professional services, which does not include payments for services furnished to MA enrollees.

We recognize that MA contracts can include financial risk as well as quality performance standards, CEHRT, and other health IT requirements that support high-value care. We proposed to evaluate payment arrangements between eligible clinicians, APMs Entities, and MA plans according to the proposed Other Payer Advanced APM criteria. In the assessment of MA plans for the Other Payer Advanced APM criteria, it is important to note that the requirements refer to aspects of the payment arrangement between the MA plan and the participating APM Entity, and this includes the criterion for bearing more than a nominal amount of financial risk. We noted
